The EMPEROR enriched his friends, but did not enrich himself. He let his friends make use of their position, and they often made use of it in a very unscrupulous way; but he had as much money as he could want, and he did not save. The extravagance of the Imperial Court was very great, and it was part of his political system to dazzle Paris with constant shows, to have the Imperial magnificence constantly talked about, and to keep traders satisfied, and busybodies employed. The older Sovereigns of Europe found nothing to despise in the mode in which the French Court was maintained, and while everything went smoothly the great majority of French people were much gratified to think that their EMPEROR spent so much and their EMPRESS dressed so splendidly. Still, if the EMPEROR had wished to save money, no doubt he could have done so. He might have had all his magnificence and the pleasure of economizing at the same time. But he did not think it necessary to save. He did not think of reverses and exile as matters of serious anxiety to himself or his family. He took it for granted that Providence would be on the side of the BONAPARTES. A King like LOUIS PHILIPPE properly and prudently looks upon his chance of wanting the means of keeping up a private station handsomely as one of those chances against which he ought reasonably to provide. He has been made a Sovereign to his own surprise, and he knows that an accident may unmake him as an accident has made him. The EMPEROR looked on himself in a very different light. His uncle's memory invested him with a sort of divine right, and his uncle's protecting influence kept him safe. These happy privileges would descend to his son in due course of time, and there was therefore no need to contemplate the possibility of the family living in poverty or exile. The EMPEROR has, as all the world knows, been grievously mistaken. He did die an exile, and comparatively in poverty; but even his not putting by money shows how fervently he believed in the special character of the destiny of himself and his family. As it happens, the very best thing he could have done, if the political interests of his party are to be considered, was to die poor. At a time when France is groaning under new taxation caused by a war associated with the EMPEROR'S name, its keenest indignation would have been roused against him and his family if it had become known that the EMPEROR had used his position while EMPEROR to accumulate in safety a large private fortune. As it is, no one can cast this reproach on the EMPEROR'S memory, and his son, if he ever appeals to France, will be able to do so without having to overcome the obstacle created by wealth hoarded up at the cost of a suffering country.

IRISH RAILWAYS.

THE Irish members were, as usual, unanimous in their support of the proposal for purchasing the Irish railways. The evils of which they complain undoubtedly exist; and some of the objections which are urged against the scheme of a State purchase might probably be overcome. It is true that there is no distinct Irish revenue; but there are several modes in which Ireland might, if necessary, be separately taxed. As Dr. BALL remarked, public money is habitually advanced on the security of the county cess; and a compulsory rate might, if the Irish members consented, be charged on property as a guarantee for any loss which might be incurred on the railways. It is highly probable that the enthusiasm which is felt for Lord C. HAMILTON'S proposal might rapidly cool if it encountered a definite proposal for an increase of local taxation; but if there were no other objection to a purchase, a practical test would be more effective than many argumentative speeches. It would probably appear, when the experiment was tried, that the districts which are comparatively well served by the Railway Companies would object to pay an equal contribution to a fund which would be principally for the benefit of other parts of Ireland. It is alleged, not without reason, both that the actual railways are in various degrees inefficient, and that there is an urgent demand for the construction of additional lines. The proposal of a general purchase implies a liability to supply the deficiencies of private enterprise. The advocates of the scheme have generally assumed that an increase of accommodation, combined with a large reduction of fares, would for some time impose a considerable burden on the State or on the Irish taxpayer. They have for the most part not considered the more serious cost of raising capital for additional lines which have hitherto not been thought sufficiently promising to attract private promoters. It can scarcely be doubted that Ulster would object to pay its share of the interest on a railway which might tend to improve the wilds of Connemara. Residents on the prosperous Great Southern and Western Railway would be likely to prefer rates and fares which may perhaps now be thought too high to direct taxation which would affect that part of the population which neither travels nor supplies freight to railways.

The grievance which provides Mr. DOWNING and Mr. DELAHUNTY with a new argument for Home Rule is of the oddest kind. Under the present system Ireland is exclusively ruled by the Irish in all matters connected with railways. If there are four hundred Directors where, it is said, forty would suffice, they are all Irishmen, placed and kept in office for the most part by Irish constituents, who have preferred the creation and continuance of petty Companies to a more comprehensive and simple railway policy. A line of the most brilliant prospects projected to Skibbereen has, according to Mr. DOWNING, to be abandoned because an alien Government, represented by a cynical CHANCELLOR of the EXCHEQUER, refuses to advance a moderate sum of money on the guarantee of shares which have never been created. To remove his scruples, many persons of undoubted wealth offer their personal guarantee in aid of the questionable security of the railway; but they are contumeliously informed by Mr. LOWE that Government advances cannot be legally made on personal security. The grand jury of the county had guaranteed a dividend of five per cent. on the stock after the completion of the railway, and only 40,000*l.* was required to silence the objections of the Treasury, and to confer an inestimable benefit on an important Irish district. Neither on the security offered by the grand jury, nor through the private resources of the wealthy promoters, could the moderate sum be raised; and yet Parliament is asked to believe that Irish funds would be readily forthcoming for the purchase of all the railways in Ireland. The high fares and rates are fixed by Irish Directors; the slow trains are stopped or delayed by Irish traffic managers, appointed by Irish Boards; and it would seem that the great remedy for the railway grievance is not the panacea for ordinary national misfortunes, but the transfer of the management and control of Irish railways to a Government which is principally English. If low rates would be remunerative, and if there is a demand for better accommodation, the Irish Railway Boards have nothing to do but to abate, to the profit of their shareholders, the existing grievances. It is said that coals are carried in Ireland at a rate which has long been obsolete in Great Britain; but it is not stated whether a higher profit would be obtained by carrying them cheaper. It is evident that the State can do nothing but what the Companies can, if they think fit, do for themselves; except, indeed, that it may at its discretion conduct the business at a loss. The advocates of purchase sometimes assert that it would be worth while to submit to a pecuniary sacrifice for the purpose of encouraging trade and locomotion; but if they entered into practical details, they could scarcely defend the policy of taxing stationary farmers for the purpose of cheapening railway tickets to tourists or commercial travellers. The utmost which could be reasonably demanded would be that the State should, after paying interest on capital and cost of working, dispense with further profit; but in many cases it is doubtful whether the attainment of such an object would be compatible with a reduction of rates and with an increase of working expenses. It is admitted on all hands that a State purchase is not necessary for the introduction of more economical management. The London and North-Western Railway, which is alone equal in extent to all the railways of Ireland, is in this Session seeking amalgamation with the Lancashire and Yorkshire system, which is itself larger than any single undertaking in Ireland. It might have been supposed that the petty Companies which justify the complaints of Mr. O'REILLY and his colleagues might imitate a familiar example before they applied to the State for relief. The economy which they would have secured by union would entitle them to claim a higher price if they were afterwards purchased by the State.

The Irish Companies are not professedly promoters of the agitation for purchase. As one of the speakers complained, they seem to think that they can obtain a better price by holding back than if they openly solicited an offer. The larger and more thriving Irish lines have no desire to sell their property, although they might of course be tempted by adequate terms. The Companies which border on insolvency would not unwillingly treat with a purchaser; but the property which they have to sell has not a remunerative aspect. The Irish supporters of purchase properly disavow any desire to benefit shareholders; but it is well known that some of the most active promoters of the agitation are proprietors of un-

profitable railways. As to the greater part of the capital invested in Irish railways, the purchase, if it is at any time effected, will be altogether compulsory. Mr. GOLDSMID, whose arguments were afterwards partially adopted by Mr. GLADSTONE, contended rather against the transfer of railways to the State than against Lord CLAUD HAMILTON'S limited proposal. As Mr. GLADSTONE justly remarked, it would not be impossible to deal on special grounds with Irish railways, if a sufficient cause for interference were established; but the Government has not seen its way through the difficulties which surround the project on every side. Mr. GLADSTONE prudently explained away Lord HARTINGTON'S hasty pledge of last year, and he proposed an alternative which was afterwards justly described as liberal. On certain conditions the Government is willing to advance money to Railway Companies at a low rate of interest, on the security of their debentures, and Mr. GLADSTONE calculates that the saving which would be effected by the aid of the Government loan, added to reductions of expense to be produced by amalgamation, would yield an additional revenue of more than 100,000*l.* a year. If the Treasury is secured from loss, there is no objection to the proposal, except that the Irish Railway Companies ought to be able to dispense with Government assistance. Several of them have at present no difficulty in borrowing money on debentures or debenture stock at a moderate rate of interest. The best claim to State assistance will perhaps be possible insolvency.

Mr. GLADSTONE had apparently wavered before he formed a provisional determination to abstain from the purchase of Irish Railways. It is possible that he may have sometimes felt inclined to try, on a moderate scale, the doubtful experiment of a general appropriation of railways, and in Ireland official management would have the great advantage of offering a contrast to the indigenous administration which Irish patriots denounce and deplore. The strange plan of buying up railways and then letting them to Companies to work would operate even more perversely and paradoxically in Ireland than in more advanced parts of the United Kingdom. It would be necessary first that the State should recoup itself for its outlay, and then that the lessees should realize a profit on their undertaking. English contractors who might tender for the leases would be regarded with universal jealousy, and probably the present Directors and managers would resume the conduct of the traffic under a new denomination. Again and again the question recurs, why Home Rule answers so badly as applied to railway administration. Mr. DELAHUNTY does injustice to himself and his colleagues when he complains that no men of business are returned to Parliament from Ireland. Mr. DELAHUNTY himself is a man of business. Mr. O'REILLY adds to general ability a special knowledge of all railway affairs; but if Mr. DELAHUNTY'S charge is even approximately true, the Irish priests and their obedient constituencies are wholly responsible for the choice of incompetent representatives. It would surely be as hopeful a project to induce little Irish Companies to add to their resources by amalgamation and by improved management as to persuade Parliament to conclude a purchase which on the part of Ireland would be a confession of incapacity. The remuneration of the numerous Directors on the various Boards is probably moderate; and if the shareholders resolve to reduce the number, they ought to have no difficulty in effecting their object. Mr. GLADSTONE suggested that something might be done by extending the alliances of Irish Companies with their powerful neighbours in England; but, as might have been expected, an indignant member at once angrily protested against the usurpation by the London and North-Western Companies of rights over the Great Southern and Western of Ireland. If the Imperial Government ever undertakes the ownership and control of Irish Railways, it may rely on provoking universal irritation and resentment.

THE VIENNA EXHIBITION.

THE International Exhibition at Vienna has been opened with the ceremonies usual on such occasions, and in the midst of troubles and difficulties which, it is to be hoped, are only temporary. The cabmen have struck, the hotelkeepers are mutinous, the Exhibition itself is in a very backward condition, and the town miserably over-crowded. On the whole, the throng of strangers do not appear to be in a particularly cheerful and complacent frame of mind, and some dark hints of cholera scarcely help to enliven the prospect. Visitors to Vienna have been assured that they would find there all the marks of social and political progress; and it is at least evident that the working classes are tolerably advanced in their appreciation of the rights of labour. A cabman who would not join in the strike had his cab smashed, himself beaten, and his house wrecked. Austrian unreadiness has passed into a proverb, but Austrian luck is equally proverbial; and, in spite of the present discouraging state of affairs, there is every chance of the Exhibition turning out a genuine success. The mere getting-up of an Exhibition is of course a very small part of the business of organizing such displays, and it is evident that the resources of Vienna, limited in themselves, have been severely overtaxed. They have been subjected to a sudden strain without adequate preparation. Just now Vienna is a city in a state of transition. Its fortifications have not very long been pulled down, and the new town which has overgrown the old limits is still in course of construction. Moreover Vienna has hitherto lain somewhat out of the common line of travel. Even Germans are more at home in Dresden than in Vienna, and the accommodation of the Austrian capital has been chiefly adapted to the wants of a comparatively small, exclusive, and wealthy body of visitors. It used to be said that Vienna was one of the dearest cities in Europe; and for a stranger who desired to be comfortable, and to enjoy himself, it certainly was so. In London or Paris a man can live cheaply or expensively pretty much as he chooses, and there are infinite gradations of expenditure open to him. But at Vienna there was practically no choice between living well, and at considerable cost, and living very badly. The consequence was that Vienna never knew what it was to be over-crowded, and had few dealings with the ordinary run of tourists. The hotels trusted mainly to a select circle of guests who relished good dinners and good wine, and did not object to pay for them. It is probable that during the present summer this class will be rather doubtful about visiting their favourite capital. Vienna has now a very different set of guests to entertain, and it is no wonder that it has at first not quite succeeded in adapting itself to their wants. The action of the local authorities, more energetic than discreet, has hardly tended to smooth matters. Not only the cabmen, but the hotelkeepers, have been taken rather roughly in hand, and a variety of hard and fast regulations imposed upon them. The hotels at Vienna are not very large or very numerous, and the practice of letting private lodgings is almost a novelty. A register of lodgings was opened, but people who wished to let their rooms to the best advantage naturally resented the official restrictions, and preferred to retain in their own hands the right of bargaining with their guests. The hotelkeepers held that they were entitled to similar freedom, and it would seem that the authorities have had to give way. Edicts which in former years would have been accepted as a matter of course are now not only resented, but defied, and it is evident that paternal government is no longer regarded with that grateful acquiescence which is indispensable to its success. It is only natural that at the outset all classes should endeavour to make the most of the expected harvest; but when things settle down, prices will perhaps become less unreasonable, and a more satisfactory return will be given for them.

Those who defer their visit to Vienna for another month or so will probably find the city better prepared to receive them, and the Exhibition more complete. As it is, it would seem that the opening of the Exhibition implies little more than the opening of the Exhibition building, and that the Exhibition has still to be got ready. A considerable part of the display will of course be similar to the sort of Exhibition with which we are already sufficiently acquainted. People who wish to examine the productions of Western Europe will doubtless be able to do so to more advantage nearer home. It is idle to attempt to disguise the fact that an International Exhibition is, after all, only a collection of shop-windows, and though shop-windows are exceedingly interesting in their way, still it is hardly worth while to go to a distance to see what can be seen any day in the streets. The failure of recent Exhibitions in our own and other countries has been mainly due to the predominance of the common shopkeeping element. There is no reason to suppose that this element is not abundantly represented at Vienna, but there at least one may expect to find a spice, and more than a spice, of novelty and freshness. Austria and the countries lying towards the East ought of themselves to supply the materials for a very attractive and curious display. The natural resources of Austria are rich and varied, but their full measure can only be tested when the country has been thoroughly opened up. Mines, forests, vineyards, immense corn-fields, and manufactures of almost every kind

offer an ample field for national industry; and even within a short period the productions of Austria have lost much of the crudeness and imperfect workmanship which formerly distinguished them. It is perhaps not without significance that the place of honour, as well as the largest share of space, in the Exhibition has been assigned to Germany. It has been conveniently discovered that, on geographical grounds, as Germany is in the centre of Europe, she ought to occupy a central position in the International Exhibition. The Exhibition, however, is supposed to include the New World as well as the Old, and geography has perhaps been adapted to political considerations. In addition to the space allotted for ordinary courts, Germany has quite a settlement of separate buildings for special exhibitions—a hall for illustrations of the German school system, another for German industry, two more for German mining and metallurgy, and another for KRUPP'S steel. It may be presumed that at Vienna at least the Austrians are still keenly German, and the German part of the Exhibition will therefore be regarded with something like national sympathy. It is conceivable, however, that this preponderance of Germany, and the magnetic influence which may possibly be attached to it, may suggest to the minds of statesmen some disquieting reflections as to the maintenance of the integrity of the motley and imperfectly cemented Austrian Empire. There will probably be no lack of big guns in Mr. KRUPP'S collection, but the exhibition of the German school system may perhaps exercise a more seductive influence on the German population of Austria. On the other hand, it will be interesting to ascertain what signs there are of new vitality and progress in those Eastern races towards which, according to another theory, Austria is being irresistibly drawn.

It is possible that many visitors to Vienna will be disposed rather to study the social character and habits of their hosts than to indulge in political speculations. Those who know Berlin will find a curious contrast in Vienna. The Austrian capital is in every way a more pleasant, cheery city, with, if not more life, at least more colour and animation about it than its rival in the North; and as the city is, so are the inhabitants. If the Austrian has not the Prussian's sharpness and quick eye for the main chance, he at least he is free from the offensive priggishness and sullen arrogance which are too often encountered in the North. The Austrian is frank, cheerful, and thoroughly genial. With the Frenchman he has points of contact in his social qualities, and with the Englishman in his sense of order, conservative steadiness and solidity, and fondness for out of-door sports. He likes a quiet, easy life, and to rub on smoothly with everybody; indeed his whole disposition is eminently social and friendly, and much of the good fortune of the nation, the sort of luck that has warded off or broken the force of disasters that would have crushed any other, may be traced to this happy temper. It is impossible not to see in the Prussian, as in the American, an uneasy distrust both of himself and of the people he meets, as if doubting whether he is showing himself off sufficiently and getting justice done to the greatness of the country represented in his person. The Austrian, more self-complacent and composed, is at ease with himself and puts others equally at ease; and his placid philosophy has more than once conciliated an enemy at a critical moment. Apart from the Exhibition, Vienna is certainly a pleasant city to visit, but it will hardly be seen at its best while the Exhibition lasts. The discomfort of the present state of affairs will probably be mitigated as the arrangements for the accommodation of strangers get into proper order, and as prices find their level. But still Vienna, crowded, bustling, overflowing with eager tourists, will necessarily have lost much of the charm which attaches to the ordinary snug, easy, homely life of the city. A crowd which would make little difference in London or Paris will be enough to change the aspect of Vienna. Travellers may console themselves with the reflection that they need not stay in Vienna longer than they choose, and that they are within easy reach of a vast number of beautiful and interesting places.

THE LIBERATION SOCIETY.

MR. LEATHAM recommends the Liberation Society to take courage because the question of the separation of Church and State has already passed the stage in which changes are resisted on grounds of abstract principle, has come near the end of the stage in which they are resisted on grounds of expediency, and is on the eve of entering upon the final stage in which they are met by a mere plea for delay. He forgets that these stages, even supposing that they follow one another with absolute regularity, may, like geological periods, be of very unequal lengths. A question may run rapidly through the first two, and yet be a very long time in getting out of the third. Even the prediction that the separation of Church and State is almost past the second stage may yet prove to be premature. Perhaps a simpler analysis of the progress of great political changes would resolve them into two stages—one in which the opposition rests upon theory, another in which it takes its stand on the practical objections to the proposal. It may be conceded to the Liberation Society that the separation of Church and State is no longer seriously resisted on the first of these grounds. The believers in the doctrine that a community made up of persons of all religions is bound to single out some one of them as the recipient of special favours may almost be told upon the fingers. The real strength of the Established Church consists in this—that it is very hard to say what advantages would follow upon disestablishment, and very easy to suggest grave evils that might follow upon it. Of course to those who hold that the existence of the Established Church involves a continuous violation of justice, this fact will appear of no importance. Wrongdoing does not cease to be wrongdoing because its mischiefs are not immediately apparent. But it may yet turn out that the bulk of the English constituencies need to be further enlightened on this point. Their notion of inequality is practical, not theoretical. It is always associated with a grievance. Regarded in this light, an Established Church may not look so black as it has been described. The Dissenters have been so successful in getting rid of the incidents of a State religion which entail any hardship on those who do not belong to it, that they have cut themselves off from using the argument which the existence of these incidents might have supplied to the advocates of entire separation of Church and State. A similar cause averted disestablishment in Ireland for more than a generation, and there it operated under immense and unavoidable disadvantages. In Ireland the Established Church was the Church of a minority, while those who dissented from it belonged for the most part to a single communion, and that a communion marked off from it by the widest possible distinctions. In England the Established Church is still the Church of the majority; while those who dissent from it have little union among themselves, and are in many cases separated from it by differences of little or no practical moment.

It is far from unlikely, therefore, that the Liberation Society may apparently come a good deal nearer to success than they now think themselves before discovering that a new and unforeseen class of obstacles has yet to be surmounted. Apart altogether from these higher arguments to which we should ourselves be disposed to attach the most importance, and which are too familiar to require to be repeated, there is another order of considerations which may be found to have considerable practical force. The irrepressible ratepayer, for example, may have a word to say on the subject, and, considering how often the parson stands to him as the outward and visible symbol of a variety of voluntary agencies which tend in one way or another to relieve local charges, it is not to be taken for granted that this word will be in favour of disestablishment. Whatever the "Educated Gentleman" theory may be worth in other respects, it is indisputable that the parson is the channel, both as regards collection and distribution, of a great deal of money which in the event of disestablishment would, or at all events might, be lost to the community. What compensating gains do the Liberation Society hold out to the ratepayer in return for this probable increase of his already heavy burdens? Mr. ARNOTT rests his case on the greater power of coping with Romanizing tendencies which the Church of England would possess after disestablishment. If this expectation is shared by the ratepayers generally, it will be interesting to watch the struggle between their zeal for Protestant truth and their zeal for local economy. Mr. MIALL proposes to secure their co-operation by holding out the hope that the Christian religion will be raised by disestablishment to that "higher plane" where it shall be delivered from the entanglement of political affairs. It is doubtful whether the mass of the ratepayers will not prefer to see the Christian religion left on its present lower plane if the process of raising it promises, when closely looked at, to prove unexpectedly costly. Mr. MIALL instanced as a further benefit to be derived from disestablishment that the Church would be ruled by those who are its members. Two years ago he might have insisted that the general tide of ecclesiastical affairs in Europe was setting in this direction. The Italian

motto, "A free Church in a free State," had not then been openly repudiated by any Protestant State, while the disposition to adopt it was steadily growing in the Catholic States. To-day this state of things exists no longer. In the Empire of Germany and in the Republic of Switzerland the avowed object of the Government is to deprive the Church of its liberty, to ensure that it shall be ruled by those who are not necessarily its members, to set the Christian religion on a plane where, if it is delivered from the entanglement of political affairs, it shall be by the summary process of making it a branch of the permanent Civil Service. So much has been said at former meetings of the Liberation Society about the universal tendency towards disestablishment, that it might have been expected that Mr. MIALL would not have allowed this remarkable change to pass without notice. We are not asserting that it will eventually operate unfavourably for the objects of the Liberation Society; for the spectacle of what happens to State-supported Churches in Prussia may possibly create a feeling in favour of disestablishment inside the Church of England. But, whether it makes for or against the Liberation Society, it is singular that Mr. MIALL should have omitted all reference to it.

There is one of the resolutions adopted at Wednesday's meeting with which we entirely agree. It is that which expresses regret "that the supporters of Church Establishments "should have had recourse to clamour and violence in order "to obstruct the public advocacy of the Society's principles." The resolution goes on to say that such proceedings are "one of many indications of the progress which those prin-"ciples are making in the estimation of the public." If the tactics in question were generally adopted by the friends of the Established Church, this would be a very legitimate inference. But "lambs" of the kind required to break up a meeting can be hired so cheaply that a few foolish or low-bred people may easily create an impression that they constitute a much larger percentage of the body to which they belong than is really justified by the fact. If ever the time comes when the Established Church will have nothing better to trust to than the rowdyism of a few of its professed supporters, it may be conceded that the end will not be far off. At present the assumption of the Liberation Society, however natural it may be under the circumstances, is to say the least exceedingly hasty. It requires, we think, a very sanguine mind to discover indications of the progress of the Liberation Society's principles in the estimation of that vast public which remains outside the immediate influence of sectarian organization and platform rhetoric. On the whole, the chief impression which Liberation speeches and resolutions will produce on most observant minds is that their authors have not even begun to realize to themselves the immense, if apparently inert, weight and force of the obstacles that they have to overcome.

AGES OF MAN.

IT is always a temptation in reading history to think and speak as if Hesiod's parable of the five races of men were a real law of man's history which is acted over and over again from generation to generation. People, by the way, almost always quote that parable as if the gold, silver, and so forth expressed ages of the world, whereas what the poet is speaking of is successive races of men. Hesiod's notion is the exact opposite to Mr. Darwin's. He knows nothing about development and selection, about an advance from one physical or moral state to another. To be sure, if he does not acknowledge progress upwards, neither does he acknowledge progress downwards. As if to torment the divines and the philosophers at once, he preaches the doctrine of a constant succession of new creations. Five times has Zeus made man upon the earth. Four times has he taken away the race of men whom he had created to a better or a worse place according to their deservings. He will some day do the like by the fifth race, the worst of all, which is now upon the earth, and that seemingly, according to Hesiod's belief, before very long. Of his first three creations, the men of gold, silver, and brass, each was inferior to the race before it. It is inferior, not by any process of degeneration, for in each case the elder race is swept away; but because Zeus himself each time calls into being a worse type of man than he did before. The fourth time he succeeds better and makes the godlike kin of the heroes, the men who fought before Thebes for the sheep of Oidipous and before Troy for the fair-haired Helen. Last of all he makes his worst attempt; he creates the iron race of men which was in being when Hesiod sang, and which we suppose has gone on in being ever since. In none of these cases is the later race the progeny or the development of the earlier; each is created afresh. It has often been pointed out that the introduction of the fourth race, the race of heroes, between the bad brazen men and the still worse iron men, breaks the consistency of the story as a tale of gradual degeneracy—though of course degeneracy is not the right word—marked by a regular succession of metals. But, putting the metals aside, the breaking of a general course of degeneracy by a period of virtuous reaction is only what we constantly meet in human affairs. The interposition of a better fourth race between the bad third and the worse fourth answers very well to such periods in real history as the time of the Achaian League in Greece and the time of the good Emperors of Rome. It has been marked over and over again that, as a rule, revolutions do not come, and that States do not fall, when things are at their very worst, but rather when attempts, perhaps ill-timed and unskilful attempts, are being made to make things better.

But our point is that the Hesiodic notion of a succession of races of men seems practically to affect men's ideas of several periods of history. Perhaps people do not go so far as to believe in an actual destruction and fresh creation, but they seem to believe that at certain times all the fathers die off at once and all the sons take their places. It is really hard to avoid the notion that a man is born at the time when we hear of his first actions. The division of historical time into marked periods is so convenient, it is both such a help to the memory and it does so much to give us clearer notions of successive states of things, that we are apt to fancy that ever and anon the world, or some large part of it, made altogether a fresh start, that the old men and the old things utterly passed away, and that a new set of men with a new state of things began all at once. Nobody of course really believes this as a literal fact, but it is one of those inevitable notions which have a practical influence on men's ways of looking at things. No doubt there really are times which can be parted off more distinctly than usual from the times before or the times after them. It sometimes happens that a great number of leading men, sovereigns of principal States or the like, die off at about the same time, that a number of inventions or changes or important events of one kind or another happen about the same time in different countries, so that things really do look as if everything was making a fresh start at once. And times like these ought carefully to be noted; they are the landmarks and stepping-stones at which it is well to halt and look backwards and forwards, and to compare the times which are past with the times which are coming. Still we must not carry this process too far, not so far as to fancy that, in any sober sense, old things have passed away and all things have become new. We must not forget that the men who played the chief part in the new system were not, as we just before said, born at the time when they begin to play their part. They were born under the old state of things, they were brought up under it, they carry its ideas with them, even if they carry them with them merely for the purpose of throwing them away. In short, everything is continuous; there is no such thing as a fresh start. The earlier state of things always influences the later, and never does it influence it more directly than when the later state of things goes on the avowed principle of getting rid of the earlier. At the great French Revolution men went on this avowed principle; they wished to break with the past altogether, to get rid of all that was in being up to their own time, to have new things whenever they could be had, and, when that could not be, to give at least new names to the old things. But this conscious attempt at breaking with the past was itself one form of the influence of the past. The eager attempt altogether to sweep away a certain state of things showed the impression which that state of things had made on men's minds. The past influenced the course of history by the very attempts which men made to get rid of the past. Things went differently from the way in which they would have gone if men's minds had not been so full of the past, though only with the object of destroying it. The new things, the new names for old things, were a more striking memorial of what they supplanted, they brought the old things and the new names more forcibly before men's minds, than if the old things and names had in themselves gone out, or had been left to die out in the ordinary course of nature.

The accession of Elizabeth is one of the times at which men and things in general seem, in the way of which we have spoken, to take a fresh start. The character of the time becomes widely different from the character of the time just before it, and the fact that the leading figure in the new state of things was young perhaps helps to strengthen the impression that all things started fresh together. The old men and the old things seem swept away at a stroke. Cecil in the State, Parker in the Church, seem as if they had sprung into being on purpose to be the leaders of a new race of men. It is hard to believe that the men really belonged to an earlier generation, and that their minds and characters must have been formed under a wholly different state of things. It needs an effort to bear in mind that Parker was born in the reign of Henry the Seventh, and that, but for his own refusal, he would have risen nearly as high under Henry the Eighth as he did under Elizabeth. Cecil was a younger man—about midway between the age of the Archbishop and that of the Queen—and, as he reached a great age and lived nearly to the end of the Queen's reign, he seems to be in a more special way identified with it. Still, at the accession of Elizabeth he had reached the age of thirty-eight, a time by which the characters of most men are pretty well formed, and when it has been made pretty clear what manner of men they are. It is well to remember that men who seem so distinctly Elizabethan had seen a good deal of the world before the Elizabethan age began. We do not mean that anybody seriously thinks otherwise, that anybody, if he stopped to think for one moment, would doubt about the fact. We only mean

that it is one of those things which people, if they formally remember, yet practically forget. The truth of course is that, till the accession of Elizabeth, Parker and Cecil, though they were men, the one in middle life, the other somewhat beyond it, though each was a man of mark, and had filled important offices, still neither of them had reached that kind of position which makes them stand out in history in the first rank of men of the time. We therefore get the involuntary impression that their career began at the time when they began to be really prominent in everybody's eyes. We shall understand the Elizabethan period better if we remember that, at the end of Henry the Eighth's reign, Parker was a distinguished divine, a dean and a master of a college, who had refused a bishopric; and, what should never be forgotten, that he somehow contrived to keep safe in England during the reign of Mary. We should remember too that Cecil was coming into notice before the death of Henry the Eighth, that he had been Secretary of State under Edward the Sixth, and that he went quietly to mass under Philip and Mary. Again, the fact that the reigns of Henry and Elizabeth are cut off by two other reigns, and those specially busy reigns, in which so much was changed backwards and forwards, makes us apt to forget how short the real interval was. It brings the course of time more truly home to us when we find that, even in the time of James the First, there were still a few ejected monks living, and receiving the pensions granted to them by Henry. In the early years of Elizabeth the ruined monasteries, those whose buildings were neither preserved nor wholly swept away, were not the picturesque ruins softened and mellowed by time, in which poets and artists delight, but they must have shown that bare and patched and in every way unpleasant look which belongs to a building which has been lately unroofed and dismantled.

It is in this way often useful in reading history to stop and think what events any particular mind could have remembered. In Grecian history Isokratês and Polybios have often been pointed out as the men whose memories must have been more instructive than those of almost anybody else. In the case of Polybios no unusual length of days was needed to see an amount of change such as could hardly have been seen in the course of an ordinary lifetime in any other age. He simply saw, without, as far as we know, living to any remarkable age, all the events which ruled that Rome should become the head of the world. Isokratês, without seeing quite such changes as these, saw some very remarkable events, and saw more of them than other people, by sheer dint of living longer than other people. A man who dies at the age of ninety-eight by his own act unfairly defrauds the world of some part of his experience. Still it was something to have been born before the Peloponnesian war began, to have been able to talk to survivors of the fight of Marathon, to have been grown up at the time of the Sicilian expedition, and to live to starve himself after the overthrow of Chaironeia. In this case we so thoroughly identify the man with the later time that we are apt to forget that he more truly belonged to the earlier, and that the peculiar character of his writings and his way of looking at things is doubtless owing to the fact that he did belong to an earlier time. Our surprise is the other way when we find Junia, the niece of Cato, the sister of Brutus, the widow of Cassius, dying quietly in the eighth year of Tiberius. Such a fact as this reminds us of what people are apt to forget, that the glories of the so-called Augustan age are really the glories of the last generation of the Republic. Virgil, Horace, Livy, lived on to carry into the Imperial age the vigour of the days of the Commonwealth. The reign of Augustus is singularly barren of men of any mark born in it, though here again it seems to carry us over a long time when we find that Galba had seen Augustus in his childhood.

But if this tendency is at work which makes us involuntarily fancy that men came into being at the time when they rose into eminence—that is, which makes us practically look on men as younger than they are—there is another tendency which makes us fancy some men older than they really were. There are some kings whose reigns were nearly as long as their lives, and some of them began really to take a part in affairs when they were very young. Such was the last Philip of Macedon; such was the Emperor Henry the Fourth. Neither of them lived to be sixty, yet Livy talks about Philip as "senex" and "senio confectus" a long while before his death, and almost every historian who writes of Henry the Fourth draws a moving picture of "the aged Emperor" persecuted by his rebellious son. Henry, like our own Henry the Seventh and his contemporaries, may very likely have grown old before the proper time, but this is not what is meant. Such expressions simply mark the involuntary feeling that men who had been before the world for so great a number of years must really have lived an unusual number of years themselves. Altogether it is no unimportant matter in history as well as common life to mark carefully the ages of the people with whom we are dealing. We remember an old clergyman who, whenever any person whatsoever was mentioned, always asked, and that in a broad North-country dialect, "Praigh what caged mon might he be?" The question is a good one to ask in every page of historical reading, provided we not only ask how many years each man had lived, but what events a man who lived that number of years could remember.

NATURE-WORSHIP.

THE leaders of the poetical revolution of the beginning of this century were in the habit of describing their own movement as a return to nature, and expressed their dislike to the school of Pope by denouncing what they called its artificiality. These catchwords have undoubtedly a meaning; and yet when one looks into them with the desire for a precise definition, they seem to elude any definite grasp. Is it possible, in fact, to contrast art and nature thus broadly? Must we not take man and man's works to be a part of nature, if we would speak philosophically? Cowper's aphorism about God making the country and man making the town seems to imply a very singular theology; for, if we fix the assertion down to its direct logical meaning, it would amount to declaring that God made trees and beasts and did not make man. Otherwise, why should a house be a less interesting object than a nest? The difference between the work of a bird and the work of a human being cannot surely be that the one is and the other is not of divine origin; but simply that reason has in one case been the divinely appointed substitute of blind instinct in the other. Of the two, one would say that an object which implies the action of reason should be the more interesting to a reasonable being. Pope, in fact, has put his own case with undeniable force. In his earlier efforts, as he tells us, "pure description held the place of sense"; in his more mature work he acted upon the doctrine that "the proper study of mankind is man." His theory seems to be sound enough, whatever may be said for his practice. The *Essay on Man* is full of grievous poetical faults, for which reason few people read it at the present day. But it deals with the most perennial sources of human interest; the position of man in the universe, and his relations to his Maker and his fellow-creatures, are the topics with which the greatest poets as well as the deepest philosophers will continue to occupy themselves chiefly. And when the reaction against Pope's artistic practice led to the rejection of his theory, and to a sort of vague impression that a poet's business was to describe the colour of a primrose or the motions of a cloud with photographic accuracy, instead of dealing with human emotions, the error was of a more serious kind than that which it supplanted. The true objection to Pope was not that he wrote about human nature, but that he took a prosaic view of human nature; though it would require a difficult analysis to say in what particular aspects his view deserves to be called prosaic.

Without entering upon that question, we may safely assume that the interest in what is called nature—that is to say, in inanimate objects or in the lower orders of animated beings—is often carried to excess in the modern school. We have seen unqualified praise lavished upon a poet for his unfailing correctness in observation of natural objects, as, for example, in making flowers blossom at the correct period of the year. Undoubtedly such correctness is a merit in a poet, so far as it enables him to appeal more forcibly to our sympathies. A poet who should make daffodils appear in November instead of "coming before the swallow dares" would perplex and annoy us by the confusion. But the mere accuracy of Shakspeare's dates in the exquisite passage from which we quote is not properly a poetical merit at all; it is one which he shares with a gardener and in which he is surpassed by a professional botanist; and for anything that appears so far, his writings might be on a level with a scientific manual. The poetry enters when the emotion naturally associated with the daffodils is so sympathetically indicated. The claim, therefore, of modern poetry, so far as it rests upon the close observation of nature, must imply the doctrine that some of our deepest emotions are excited by the contemplation of inanimate objects. Yet when that doctrine is expressed too absolutely, it becomes a kind of Byronic misanthropy. We are invited to admire the sea because it is in the habit of sending man shivering and howling to his gods—a sentiment which, on the whole, seems to imply rather a morbid frame of mind. Indeed, the doctrine might be inverted. Is it not more artificial than the contrary to delight in savage scenery for its own sake? Does not the love of barren mountains, so characteristic of modern poetry, imply an unsocial, which may be fairly called an unnatural, aversion to our fellow-creatures? A perfectly healthy mind should, it may be argued, take more interest in the cultivated scenery which supplies food and shelter to human beings than in the wastes of desolate ice and rock where no human life could sustain itself for more than a few hours. Our love of nature is therefore the measure of our dislike to our kind, and proves how far we still remain from being in a perfectly social state. So long as a discord runs through all social arrangements we shall delight in the wilderness; when we are thoroughly acclimatized to the new order, we shall like to live in a crowd all the year round. The better we love mankind, the more reluctant we shall be to undergo even a temporary separation. In one of his finest poems Marvell eulogizes a hill and grove belonging to Fairfax for their perfect subserviency to human wants, and he very properly, as it may seem, condemns the more unsocial heights:—

> Here learn, ye mountains more unjust,
> Which to abrupter greatness thrust,
> Which do, with your hook-shouldered height,
> The earth deform and heaven fright,
> For whose excrescence, ill designed,
> Nature must a new centre find,
> Learn here those humble steps to tread
> Which to securer glory lead.

How would the Alpine Club reply to such arguments? How can they justify their preference of the snows of Mont Blanc to the

softer charms of Richmond Hill? That enthusiastic body might possibly give a satisfactory reply. They are solacing themselves at the present moment, during the many months of enforced abstinence from their favourite madness, by exhibiting a collection of pictures by a distinguished French artist, M. Loppé, which very forcibly illustrates the peculiarity of their tastes. M. Loppé's special talent is in the representation of Alpine snows. By effecting a difficult ascent in St. Martin's Place, up a staircase which, in concession to the weaknesses of ordinary humanity, is not coated with ice, the daring tourist may find himself for all practical purposes in the heart of the Alps. Desolate snow-fields and inaccessible peaks glare upon him from all sides. One tremendous crevasse in particular, somewhere in the wilds of the *Mer de glace*, impresses him with the profound conviction that a party of guides must be frozen in a sleep of many years' duration somewhere in its unfathomable depths. That M. Loppé has taken pleasure in painting it may be inferred from the loving fidelity with which he has represented its minutest details. That the Alpine Club—which is presumably composed of ordinary human beings—loves to gaze upon this gaping grave (for so it appears to the unprejudiced observer) is equally clear from the reception which they have accorded to the painter. But is their enthusiasm creditable to them? Should we infer that they are modern ghouls, hating mankind and loving the deserts which still hold out against human invasion; or is there some better interpretation to be placed upon their peculiar sentiment? Why take pleasure in the abomination of desolation in the immediate vicinity of Charing Cross? Should these pictures of untrodden wildernesses, lighted by blood-red sunsets or shining in a ghastly light of their own, really attract people more than that full tide of human existence for which Dr. Johnson expressed a manly preference over all rural beauties?

The reply would probably start from the principle that love of nature is something of a misnomer. A man who takes pleasure in contemplating daffodils or clouds does not really think that a daffodil is a more interesting object than a human being, or attracts a larger share of his sympathies. If it did, he would be partly a misanthrope, but still more decidedly an idiot. He merely intends to imply that he is capable of enjoying solitude; and he doubtless enjoys it because he can think of the destinies of the race more distinctly when he is not disturbed by the presence of too many of its units. He can meditate on the shortness of human life or the fallacy of human hopes the more effectually when he has no inducement to listen to gossip about the chances of a particular judge making a vacancy, or a given young man marrying a specific young woman. The preaching of daffodils is effective because it is so very simple and commonplace. The true test of poetical sensibility is the power of finding fresh interest in the most threadbare platitudes. There is, in fact, a very close alliance—to modify the ordinary phrase—between sublimity and stupidity. Now the merit of a mountain, considered as a companion, is that it is incessantly but very emphatically repeating one very simple sentiment. It makes a sufficiently near approach to the unity of a living organism to be easily personified; and, when personified, it continues to say over and over again how very small man is, what a short time he can live, and how very small an effect he can produce upon the world in which he lives. Here am I, pretty much the same as I was a thousand generations before you were born, and as I shall be a thousand generations after you are buried. A ploughed field flatters human vanity, and suggests the advantages of steam cultivation and the number of quarters of corn that may be raised. A mountain with its crevasses and glaciers suggests the slow development of vast changes reaching backwards and forwards beyond the petty ken of human beings. That is clearly a very commonplace and rather monotonous observation, after a time. But yet it is the sentiment which, expressed in various forms, is the substance of a great part of all the most impressive poetry and moralizing that has ever been composed. Byronically interpreted, it may become cynical; but that is only because a Byron chooses to repine against the inevitable, instead of looking things in the face like a man. To rejoice in communion with mountains ought therefore to indicate a power of taking pleasure in some of the most solemn reflections that can occur to a human being. We do not venture to say that it actually does imply that power; for mountains have been only too effectually associated with mere athleticism or with the delights of a vigorous appetite. The most poetical objects may be turned to such base uses. We only say that when the pleasure in savage scenery is genuine and healthy, it implies a susceptibility to this vein of reflection. The love of nature generally should mean, not an indifference to human nature, but a tendency to contemplate its most simple and general aspects, instead of being distracted amongst the petty details of small personal interests. In that sense only it is admirable; and in that sense the mountains are more eloquent preachers than scenery which speaks more of human conquests over the physical world than of the insuperable barriers which restrain them within narrow bounds.

LETTERS TO YOUNG PEOPLE.

In noticing some time ago Cobbett's *Advice to Young Men*, we omitted a qualification which appears to be required of our praise of that useful volume. We should have observed that Cobbett's system of life and morals is defective in taking no account of the existence of plain women. His advice to a young man is that he should marry a pretty girl as early as possible, in the faith that the happiness thus procured would far more than compensate for the privations and trials entailed by having to keep a wife and children upon a narrow income. Now, giving the fullest application to the maxim that beauty is in the eye of the beholder, we nevertheless feel that many women and some men would be left unprovided with places in Cobbett's scheme of society. It might possibly occur to a modest man to doubt whether, when he had found a woman whom he could think pretty, she could be induced to marry him. But Cobbett perhaps did not contemplate that his young man should be more burdened than he was himself with modesty, which is not a quality well adapted for getting through the world. An American writer, of far inferior force to Cobbett, has undertaken to advise young men in the choice of wives; and he has to some extent provided for the case, which is probably more rare on the other side of the Atlantic than on this, of a young man wanting in self-confidence to go in and win in matrimony. "Never content yourself," he says, "with the idea of having a commonplace wife. You want one who will stimulate you, stir you up, keep you moving, show you your weak points, and make something of you. Don't fear that you can't get such a wife." This writer doubtless desires to be widely read; and, as he addresses both sexes, he may perhaps be able to explain to commonplace young women what part in life they are to fulfil. But at present he is speaking to young men who may fancy that commonplace wives are as good as they can expect to get. This, he assures them, is a mistake. He quotes the answer which a gentleman who happened to combine wit and common sense made to a young man who feared that a young lady of great beauty and attainments would dismiss him if he became serious:—"Infinitely more beautiful and accomplished women than she is have married infinitely uglier and meaner men than you are." The wit of this reply is to our mind less obvious than its candour. But the writer adopts it as the utterance of a modern Solomon. "'You,' says he in effect to a young friend, 'are mean and ugly, but I will teach you how to win a handsome and distinguished wife.'" If the young friend is honest and honourable, if his character is spotless, if he is enterprising and industrious, if he has "some grace and a fair degree of sense," and if he loves appreciatingly and truly, he can marry almost anybody worth his having. This of course is very nice for young men, but unsatisfactory perhaps for young women. If even pretty and clever girls are liable to be married to plain and stupid men, what is the destiny of plain and stupid girls, if there are any such in America? The principle of natural selection may be generally valuable, but its application to the particular cases of the non-selected must be inconvenient. It seems to us that this author has undertaken more than he can well perform in constituting himself the adviser of both sexes as regards marriage. Indeed he appears to feel the difficulty of being on both sides at once. "I shall not quarrel," he says, "with a woman who desires a husband superior to herself, for I know it will be well for her to obtain such an one, if she will be stimulated by contact with a higher mind to a brighter and broader development." An ill-natured American has remarked that Englishwomen have a tendency towards "broader development" in mature years, but he spoke of the person, whereas this writer apparently refers to the mind of woman, which is to be stimulated by contact with the higher mind of man. But if man at the same time desires to be stimulated by contact with the higher mind of woman, one side or the other must submit to some sacrifice of its aspirations. "At the same time I must believe that for a man to marry his inferior is to call upon himself a great misfortune; to deprive himself of one of the most elevating and refining influences which can possibly affect him." We are reminded of another philosopher who advised a young man not to marry for money, but to go where money is. This is an excellent precept to give in a particular case, but it is manifestly incapable of general application. Women as well as men can improve their minds, but unfortunately men are advised to look, as indeed they would look without advice, for bodily as well as mental grace and beauty. The handsome Paris says that the glorious gifts of the gods are not to be despised, those gifts which are given by the gods themselves, and which a man cannot have by wishing for them. It may indeed be possible to increase the supply of pretty women in the world by taking care that all the pretty women that exist are married early. But if men propose a system which takes account only of pretty women, it is not perhaps wonderful that plain women should begin to agitate for what they call their rights.

The whole result, however, of the book is that men and women are to do their best to get their minds stimulated, and otherwise to arrange advantageously for themselves in marriage. Women in general have so few opportunities of associating with men before marriage that they are often obliged to make blind bargains. The author, who is as free as his own model young man from the burden of excessive modesty, speaks in his own person thus:—"My own wife very fortunately got an excellent husband, but it is something for which she is to be grateful to an overruling Providence, for her own knowledge had very little to do with it." He speaks elsewhere of the value of religion in a family, and he doubtless contemplates that his wife thanks Heaven daily on her knees for bestowing on her the blessing of himself. In egotism, if in nothing else, this writer might compare himself with Cobbett.

In arranging marriage he took care of himself, and Providence took care of the lady who became his wife. In style he is far inferior to Cobbett, and indeed it is vain to expect elegance of language from a writer who tells young women that "development in the broadest sense" is the end of their lives, and who explains his view of religion by saying that humanity had got off the rails and was sticking in the mud when Christianity came to help it out. Cobbett had warned his young man that, whatever he may think before, he will find out after marriage that his wife is not exactly an angel. But this writer goes inexorably into details which Cobbett spared. By the time, he says, that the husband has seen his wife eat heartily of pork and beans, and with her hair frizzled, and her oldest dress on, busily set on overhauling things, he sees that she belongs to the same race as himself. This is lamentably true, but perhaps hardly consistent with other portions of the treatise. It will probably have occurred to young men to suspect, without going the length of imputing a fondness for pork and beans, that young ladies have in private better appetites than they display in public. There are illusions in many courtships which marriage dissipates, but if young men and women saw as much of one another before marriage as the author desires, it is possible that these illusions might be dissipated prematurely, and the prospect of marriage might not survive them. A companion picture to the bride who eats heartily of pork and beans represents the bridegroom getting up cross in the morning, and trying to shave himself with cold water and a dull razor, "while his suspenders dangle at his heels." It is perhaps inevitable that husbands should be cross and wives addicted to pork and beans, but if men shave, which is happily no longer necessary, they can easily be supplied with machines for warming water and with sharp razors.

The author's ideas of dress for men are novel. He does not exactly adopt the notion that the ends justify the means, or in other words that a good hat and boots will atone for shabby coat and trousers; but he proposes the thrifty expedient of finding what he calls your "dress centre" and adorning that, while the rest of your person may be left quite plain. This "dress centre" is a nucleus from which the rest of the dress should be developed and unfolded. This "dress centre or primary dress idea" is different in different persons, but it is always above the waist. We seem to ourselves as we quote this passage to be talking that sort of nonsense which about this time of the year begins to be passed upon a confiding public as art criticism. But what which we ignorantly think nonsense may, after all, be refined art. Only we should like to know how to find the dress centre, say, of Thomas Smith. "The cravat, the vest, the hat, the bosom, the coat-collar, may either of them, be this idea," in Thomas Smith, or anybody else. Thackeray has said that if a man can do nothing else to entertain an evening party, he can at least wear an embroidered waistcoat. If Thackeray had used artistic language, he would have said that a man can find his dress centre and adorn it. This dress centre may be safely located about the neck and chest. "A beautiful cravat, sustaining a faultless dicky, is about all a man can stand without damage in the way of elegant dress." We speak with diffidence on so high a subject; but it occurs to us that a man's appearance would not suffer if he ventured upon solemn occasions to wear, not only a dicky, but a shirt. "This" (that is, the cravat and the dicky) "should form the centre." Any man who has made dress a study knows that two pounds a year spent about the neck will go further than ten pounds spread upon the person. This would be important to gentlemen of limited incomes, if true; but, unfortunately, the habit of wearing white ties at and after dinner rather interferes with the full application of the author's principle that "the whole dress should bow to the cravat." He explains more fully that the vest should harmonize, but be modest, and all the other robing should be shaded off until there is not an obtrusive feature. "Extremities will then only be noticed. These should be faultlessly dressed, but in a manner rather to satisfy than attract attention." By "extremities" the author probably means feet and hands, and in these the most inventive genius would not find much more scope for ornamentation than about the neck. But as extremities are certainly not the centre this is unimportant. The author's meaning, put into plain prose, appears to be that men should wear gorgeous neckties whenever possible. "Coarsest clothes," says he, "developed from an elegant central idea become elegant themselves, and receive and evolve a glory which costs nothing," except consideration and the reading of his letter. We have read his letter, and considered it at no slight cost of patience, but we have no hope of understanding it, unless the enterprising managers of the International Exhibition would kindly undertake to give a series of lectures upon the "central idea" of dress. An exhibition of neckties and dickies of all nations would be an attractive feature of their programme. "Let each young man choose his central idea; plant it, and develop it," and he will find that he can dress better than ever before and at half the cost. The author's precepts for choosing a wife are intelligible, and perhaps, with a sufficient quantity of assurance, practicable; but we do not see our way as regards dress. We must be content, in the absence of instruction, to wear clothes made of good broadcloth, although it is, as this author assures us, a sign of mental poverty.

THE SANITARY DIGEST.*

THE first of the two promised Digests of the Sanitary Statutes has at length appeared, and the sanitary authorities in towns can no longer plead ignorance of the extent or nature of their powers as an excuse for not putting them into operation. An octavo volume of two hundred and fifty pages professes to contain—and, so far as we have been able to examine it, does contain—a clear and methodical exposition of the existing law, in which, while the language of the statutes has been preserved, it has been stripped as far as possible of technical phraseology. The provisions relating to the same subject have been brought together, there is a sufficient index, and a very full table of contents. There can in future be no difficulty in ascertaining what the law says on sanitary matters. What the law means may still remain uncertain, for in a rider prefixed to the Digest Mr. Lambert takes care to explain that it is a digest only, that it does not claim to be an authoritative interpretation of the law, and consequently that no attempt has been made to construe or reconcile the statutes quoted. To those who think that the Public Health Act ought to have included a consolidation of the sanitary law, this will appear a lamentable, though, under the circumstances, an unavoidable, defect. That is not our opinion. Consolidation is greatly needed as regards this branch of the law, but completeness, based on actual experience, is more needed still. If consolidation comes too soon, it may tend to stereotype an incomplete state of the law, because the very introduction of the consolidating Bill, at the tail of a long course of legislation on the subject, would seem to imply that the necessary enactments are all in existence, and that they only need to be arranged and made intelligible. The law relating to public health is very far from being in this state of perfection. It is more comprehensive than it is generally supposed to be, but it stands in need of many amendments and additions. Parliament will be much better able to make these amendments and additions when the machinery created by the Acts of 1871 and 1872 has been at work for a year or two. The existing sanitary laws were then for the first time extended to the whole country. Every acre of ground has been subjected for sanitary purposes to a single local authority, and this local authority to a single central authority. Among these local authorities there will be some genuinely anxious to make full use of the powers with which they are invested, and others again genuinely anxious to do nothing which they are not obliged to do. From the representations of the former the Government will learn what additional powers are needed to enable zealous authorities to take proper care of the public health within their district. From the action or inaction of the latter the Government will learn what measures are required to make the powers conferred by the Act effectual, even in the hands of careless or unwilling administrators. At present the law has not been adequately tested in either direction. It is not known how much can be done or how much left undone. By the time that every Town Council and Local Board in urban districts, and every Board of Guardians in rural districts, has been for a certain period in possession of these Digests, has turned or not turned to account the knowledge gained from them, and in the latter case has been subjected to whatever pressure the central authority can bring to bear on them, there will be a store of material for supplementary legislation which was not and could not be in existence at the time the Public Health Act was before Parliament.

Assuming that an urban sanitary authority fully conscious of the importance of the duties entrusted to it, and desirous of discharging them to the utmost, takes the Digest in hand with the view of ascertaining the limit of its powers, let us see what will be the result of the inquiry. In the first place, these bodies have the control of the water supply. Where no proper supply at present exists, they may either make contracts with a Waterworks Company or construct waterworks of their own. Where a Waterworks Company is already established, they may insist upon its supplying water for all reasonable purposes upon terms to be settled by arbitration. Whenever a house is not properly supplied with water, and can be so supplied at a rate not exceeding 8*s.* 8*d.* a year, they may compel the owner to remedy the want at his own cost, or, if he refuses, they may remedy it themselves and recover the expenses from him. They are bound to provide and maintain all requisite machinery for securing an efficient supply of water in case of fire. They can prevent the pollution of the water under their control. In the next place, urban sanitary authorities have the control of all the sewers within their district, and they are bound to make such new sewers as may be necessary for effectual drainage. In the case of houses not provided with a sufficient drain, they can require the owner to construct a drain into any sewer within a hundred feet of the house, or, if there be no sewer within that distance, into a covered cesspool not under any house. They have the same power as regards houses newly built or completely rebuilt. They must take care that all drains, closets, and the like shall be constructed and kept so as not to be a nuisance; and in the event of any house being reported to be destitute of proper conveniences in these respects, they may require the owner or occupier to provide them, or else provide them themselves at the owner's expense. They must see that ponds and ditches are drained, cleansed, or filled up, so as not to be prejudicial to health, and they must remove at the cost of the occupier or owner of the premises any accumulation of manure or other noxious matter. They may cleanse and whitewash at the owner or occupier's expense any house which the Officer of Health

reports to be in an unwholesome condition. In the third place, the urban sanitary authorities have the management of the highways within their district. They are responsible for their being kept in proper repair, for the proper numbering of the houses, for the removal of obstructions, for the safe covering of cellars, and for the destruction of dangerous buildings. They may arrange for the lighting of the streets. A long list of offences calculated to annoy residents or passengers in the streets is set out in the Digest, any of which are punishable on conviction by a fine of 40s. Under certain restrictions urban sanitary authorities may also provide markets, and make by-laws for the regulation of the sales in them. They have the control of all hackney-carriages, and of pleasure-boats and horses or donkeys standing for hire. They may provide public pleasure-grounds and public clocks, covered or open bathing-places and washhouses. In the fourth place, urban sanitary authorities have large powers as regards the regulation of dwellings. They may, with the consent of the Local Government Board, make regulations as to the registration, inspection, and cleansing of houses let in lodgings, or occupied by more than one family. They must take proceedings upon the certificate of the Medical Officer of Health to abate overcrowding. They are charged with the administration of the Common Lodging House Acts. In places where the population amounts to ten thousand persons, they must investigate the condition of all houses condemned by the Medical Officer of Health; determine, subject to an appeal to Quarter Sessions, whether the mischief can be remedied, or whether the house must be pulled down; and require the owner, or other person responsible for the state of the premises, to execute the necessary works, or to pay for the execution of them by the sanitary authority. They are specially charged with the supervision of bakehouses, and with the enforcement of the statutory requirements as to their painting, washing, draining, and ventilation. Lastly, urban sanitary authorities have the right of refusing their consent to the establishment of offensive trades or manufactures. As regards trades already established within the limits of any city, town, or populous district, the sanitary authority, on the report of the Officer of Health, or on the requisition of ten inhabitants, must institute proceedings against any person causing a nuisance by the carrying on of such trade. All slaughter-houses and knackers'-yards, except those in use at and since the coming into operation of the Local Government Act of 1858, must be licensed and registered, and the sanitary authority may make by-laws for cleaning such slaughter-houses, and for the prevention of cruelty to the cattle slaughtered. Articles of food exposed for sale may be examined by Officers of Health or the Inspector of Nuisances, and, if found to be unwholesome, may be seized and laid before a magistrate for condemnation. The sanitary authorities are further bound to inspect their districts from time to time, in order to discover whether there are any nuisances requiring abatement. Under the term nuisance is included foul drains, animals kept so as to be injurious to health, accumulations of noxious matters, unhealthy or overcrowded houses, overcrowded or unventilated factories or workshops, furnaces which do not consume their own smoke, and chimneys not belonging to private houses which send forth black smoke in such quantity as to be a nuisance. The sanitary authorities have a right of entry into the premises complained of, either to ground proceedings or to execute works ordered to be done.

It will be seen that urban sanitary authorities, making full use of the powers entrusted to them by the several Acts embodied in their Digest, need hardly complain of having their hands tied. In practice no doubt they may discover that their progress is hindered by unexpected obstacles. The language of the statutes may be found to furnish unforeseen loopholes to those who wish to evade their operation. The machinery provided for the enforcement of the law may prove defective. The value of this or that precaution against the generation or communication of disease may turn out to be lessened by the omission of this or that other precaution. Some or all of these defects are certain to be discovered in course of time, and it will be the duty of the Legislature to remedy them as they come into view. But it cannot be maintained that urban sanitary authorities have not a good statutable foundation to work upon. It cannot be said, with any approach to truth, that the powers they already possess are worthless. Probably there is no sanitary authority that has yet made full trial of them, none that is not authorised by law to do more than it has yet done for the protection of the public health. A very great responsibility now rests upon the more intelligent and public-spirited corporations. If they set a good example in carrying out the sanitary law, if they make it their object to raise the standard of health and comfort within their districts to the highest attainable point, they will do more to promote sanitary progress than can at this moment be done by any other agency whatever. There are three principal ways in which such action on their part will exercise a beneficial influence. The first is by showing where the law needs addition or amendment in respect of the powers with which it invests the local authorities. Until these powers have been fully exerted, it is difficult to say confidently whether they are sufficient or insufficient. The second way is by showing the good results that follow from a full use of these powers, and so encouraging a larger number of urban authorities to use them likewise. There is a rivalry between towns which may prevent one from resting content under a very much larger death-rate or a very much lower level of municipal comfort than prevails in another. The third way is by creating a sound public opinion which will enable the central authority to use its coercive powers effectually, and to obtain additional powers from Parliament when those which it has are found to be inadequate. As yet the central authority has moved with caution, and even timidity, in the direction of coercion; but, considering how easy it is in this country to raise the cry of over-centralization, it would be rash to say that it has moved too slowly. Still it is essential to the extension of sanitary improvements that it should act with greater decision in time to come. There are a large number of the smaller and less enlightened sanitary districts in which it is almost useless to hope that the local authorities will go a step further or faster than they are compelled to go. If the Government can point to the larger districts as examples of the benefits conferred by an energetic sanitary policy, it will be much easier to bear down the ignorant or interested opposition which every addition to the stringency of the Public Health Act is sure to call forth.

THE CORAL-FISHERS OF CAPRI.

STRANGE as a Southern winter seems to English eyes, it is still stranger to the eyes of the South. The peasants of Sicily, the lazzaroni of Naples, the Capri fisher-folk have never yet succeeded in realizing the fact of cold as an annual fact in their life. The Englishman, whose winter spreads over half the year, pokes his October fire with a cosy prescience that he may poke on till May. Winter is the central fact in his life; he may have six months of sunshine, but he is certain to have six months of cold; and his practical mind arranges existence on the basis of the certainty and not of the doubt. His house is built for winter, his windows close, his doors shut, his fires draw; he knows that the fight with mist and fog and rain and snow and ice will be a long one, and he buckles himself steadily, as an Englishman can, to a long fight. He even gets a certain joy out of the contest. He skates, he snowballs, he keeps Christmas, he airs himself on the hearthrug, and chuckles over the comforts of home; he pulls on his greatcoat with an air of defiance, and shouts, "A fine winter's morning!" to his neighbour in the teeth of the East wind. But the Caprese peasant has never had time to get the fact of winter fairly into his head. The cold comes year after year, but it comes in a brief and fitful way that sets our Northern conceptions at defiance. The stranger who flies for refuge to the shores of the little island in November finds himself—as he did last winter—in a blaze of almost tropical sunshine. A fortnight of dull weather at the opening of December raises hopes of an English Christmas which are suddenly swept away by a return of the summer glory for a month. Far away over the sea the crests of the Abruzzi range lift themselves white against the sky, but February has almost come before winter arrives, fitful, windy, rainy, but seldom cold, even when the *maestrale*, so dreaded on the Riviera, comes sweeping down from the North. March ought, even by Caprese experience, to be the difficult month; but "Marzo e pazzo," say the loungers in the little piazza, and this time the "madness" of March takes the form of a delicious lunacy of unbroken sunshine. Corn is already rippling under the olives, leaf-buds are running like little jets of green light along the brown vine-stems, the grey weird fig-branches are dotted with fruit, women are spinning again on the housetops, boys are playing with the birds they have caught in the myrtles, the bright shore across the bay is veiled in a summer haze, and winter is gone. It is hard to provide in English fashion against such a winter as this, and the Capri fisherman prefers to regard it as Mr. Lowe regards the opposition of the priesthood, as something abnormal, exceptional, to be borne with "pazienza" and a shrug of the shoulders. When the storm-wind blows he lounges in the sunny corner of the Piazza; when the rain comes he smokes at home or mends his nets under the picture of the Madonna and the Bambino; when the cold comes he sits passive and numbed till the cold goes. But he knows that the cold will go, and that the rain will pass, and that peace will settle down again on the sunny bay; and so, instead of making a fuss about winter, he looks on it as a casual little parenthesis in the business of life, intensely disagreeable, but luckily brief. He sees no poetry in it, no beauty of bare wold and folded mist; he hears no music in it like the music of tinkling icicles so dear to Cowper's heart. Christmas itself isn't much of a festa in the South, and has none of the mystery and home pathos which makes it dear to Englishmen. There is the "presepio" in the church, there is the procession of the Wise Men at Epiphany-tide, but the only real break to the winter's dulness is the Feast of the Coral-Fishers.

What with the poverty of the island and its big families, it is hard to see how Capri could get along at all if it were not for the extra employment and earnings which are afforded by the coral fishery off the African coast. Some hundred or two hundred young fellows leave the island every spring to embark at Torre del Greco in a detachment of the great coral fleet which musters at that port, at Genoa, or at Leghorn, and the Sunday before they start—generally one of the last Sundays in January—serves as the Feast of the Coral-Fishers. Long before daybreak the banging of big crackers rouses the island from its slumbers, and high mass is hardly over when a procession of strange picturesqueness streams out of church into the sunshine. At its head come the "Daughters of Mary," some mere little tots, some girls of sixteen, but all clad in white, with garlands of flowers over their veil, and girdles of red or blue. Behind come the fishermen,

young sailor-boys followed by rough grizzled elders, bearing candles like the girls before them, and then the village Brotherhood, fishers too, but clad in strange garments of grey, with black hoods covering their faces and leaving nothing but the bright good-humoured eye to guide one under this sepulchral figure to the Giovanni or Beppino who was cracking jokes yesterday till the Blue Grotto rang again. Then beneath a great canopy upborne by the four elder fishers of the island, vested in gowns of "samite, mystic, wonderful"—somewhat like a Doctor of Music's gown in our unpoetic land—comes the Madonna herself, "La Madonna di Carmela," with a crown of gold on her head, and a silver fish dangling from her fingers. It is the Madonna of Carmel who disputes with San Costanzo, the Saint of the mother-church below, the spiritual dominion of Capri. If he is the "Protector" of the island, she is its "Protectress." The older and graver sort, indeed, are faithful to their bishop-saint, and the loyalty of a vine-dresser in the piazza remains unshaken even by the splendour of the procession. "Yes, Signore!" he replies to a sceptical Englishman who presses him hard with the glory of "the Protectress," "yes, Signore, the Madonna is great for the fisher-folk; she gives them fish. But fish are poor things after all, and bring little money. It is San Costanzo who gives us the wine, the good red wine which is the wealth of the island. And so this winter feast of the fishermen is a poor little thing beside our festa of San Costanzo in the May-time. For the image of our Protector is all of silver, and sometimes the bishop comes over from Sorrento and walks behind it, and we go all the way through the vineyards, and he blesses them, and then at nightfall we have 'bombi'—not such as those of the Madonna," he adds with a quiet shrug of the shoulders, "but great bombi and great fireworks at the cost of the Municipio." On the other hand, all the girls go with the fisher-folk in their love of the Madonna. "Ah yes, Signore," laughs a maiden whose Greek face might have served Phidias for a model, "San Costanzo is our protector, but he is old and the Madonna is young, so young and so pretty, Signore, and she is *my* protectress." A fisherman backs up the feminine logic by a gird at the silver image which is evidently the strong point of the opposite party. The little commune is said to have borrowed a sum of money on the security of this work of art, and the fisherman is correspondingly scornful. "San Costanzo owes much, many danari, Signore; and it is said," he whispers roguishly, "that if they don't pay pretty soon, his creditors at Naples will send him to prison for the debt of the Municipio." But the Madonna has her troubles as well as the Saint. Her hair, which has been dyed for the occasion, has unhappily turned salmon colour by mistake; but the blunder has no sort of effect on the enthusiasm of her worshippers, on the canons who follow her in stiff copes, shouting lustily, or on the maidens and matrons who bring up the rear. Slowly the procession winds its way through the little town, now lengthening into a line of twinkling tapers as it passes through the narrow alleys which serve for streets, now widening out again on the hill-sides where the orange kerchiefs and silver ornaments of the Capresa women glow and flash into a grand background of colour in the sun. And then comes evening and benediction, and the fireworks, without which the procession would go for nothing, catherine-wheels spinning in the piazza, and big crackers bursting amidst a chorus of pretty outcries of terror and delight.

Delight, however, ends with the festa, and the parting of the morning is a strange contrast in its sadness with this Sunday joy. The truth is that coral-fishing is a slavery to which nothing but sheer poverty drives the fishermen. From April to October their life is a life of ceaseless drudgery. Packed in a small boat without a deck, with no food but biscuit and foul water, touching land only at intervals of a month, and often deprived of sleep for days together through shortness of hands, the coral-fishers are exposed to a constant brutality from the masters of their vessels which is too horrible to bear description. The fishing is itself hard work. The two beams of wood laid cross-wise, with hemp and loose netting attached to them, which serve as a dredge, are dragged along the sea bottom with a rope, which it sometimes requires the crews of half-a-dozen boats to haul to the surface. If it breaks, the whole boat is in peril; if the sailor who is paying it out fails to note the moment when it catches the coral, his thigh, over which it runs, is cut to the bone. A long pull tears the branches entangled in the net from the rock, or breaks off rock and all, and a shout of joy bursts from the wearied fishermen as the tangled mass of coral appears above the waves. To the masters the fishery is lucrative enough; of the eight thousand francs which form the returns of a single boat, some two thousand are clear profit. But, measured by our English notions, the pay of the men seems miserably inadequate to the toil and suffering which they undergo. For the whole period of eight months, it varies with the strength and experience of the seamen from 12*l.* to 18*l.*; the boys receiving as little as 4*l.*; and of this much is absorbed by the extortionate shopkeepers of Torre. Enough, however, remains to tempt the best of the Capresa fishermen to sea. Even a boy's earnings will pay his mother's rent. For a young man it is the only mode in which he can hope to gather a sum sufficient for marriage and his start in life. The early marriages so common at Naples and along the adjoining coast are unknown at Capri, where a girl seldom weds before twenty, and where the poorest peasant refuses the hand of his daughter to a suitor who cannot furnish a wedding settlement of some twenty pounds. Even with the modern rise of wages it is almost impossible for a lover to accumulate such a sum from the produce of his ordinary toil, and his one resource is the coral-fishery.

The toil and suffering of the summer are soon forgotten when the young fisherman returns and adds his earnings to the little store of former years. When the store is complete, the ceremonial of a Capresa betrothal begins with "the embassy," as it is termed, of his mother to the parents of the future bride. Clad in her best array, and holding in her hand the favourite nosegay of the island, a branch of sweet basil, sprinkled with cinnamon powder, and with a rose-coloured carnation in the midst of it, the old fishwife makes her way through the dark lanes to the vaulted room where her friends await her with a charming air of ignorance as to the errand on which she comes. Half an hour passes in diplomatic fence, in chat over the weather, the crops, or the price of maccaroni, till, at a given signal, the girl herself leaves the room, and the "ambassadress" breaks out in praise of her good looks, her industry, and her good repute. The parents retort by praise of the young fisherman, and compliments pass quickly into business, and a vow of eternal friendship between the families is sworn over a dish of figs and a bottle of rosolio. The priest is soon called in, and the lovers are formally betrothed for six months, a ceremony which is followed in a few days by a new appearance of the ambassadress with the customary offering of trinkets from the lover to his promised spouse. The old Capresa costume has disappeared, but the girls still pride themselves on the number and value of their ornaments—the "spadella," or stiletto which binds the elaborately braided mass of their ebon hair; the circular gold earrings, with inner circles of pearls; the gold chain or laccétta, worn fold upon fold round the neck; the bunch of gold talismans suspended on the breast; the profusion of heavy silver rings which load every finger. The Sunday after her betrothal, when she appears at High Mass in all her finery, is the proudest day of a Capri girl's life; but love has few of the tenderer incidents which make its poetry in the North. There is no "lover's lane" in Capri, for a maiden may not walk with her betrothed save in presence of witnesses; and a kiss before marriage is, as "Auld Robin Gray" calls it, "a sin" to which no modest girl stoops. The future husband is, in fact, busy with less romantic matters; it is his business to provide bed and bedding, table and chairs, drawers and looking-glass, and, above all, a dozen gaudy prints from Naples of the Madonna and the favourite Saints of the day. The bride provides the rest, and on the eve of the marriage the families meet once more to take an inventory of her contributions, which remain her own property till her death. The morning's sun streams in upon the lovers as they kneel at the close of mass before the priest in San Stefano; all the boyhood of Capri is waiting outside to pelt the bridal train with "confetti" as it hurries amidst blushes and laughter across the Piazza; a dinner of maccaroni and the island wine ends in a universal "tarantella," there is a final walk round the village at the close of the dance, and the coral-fisher reaps the prize of his toil as he leads his bride to her home

MR. MACREADY.

THE death of Mr. Macready has followed soon upon that of his friend Lord Lytton, and, as a help to estimating the great actor's services to dramatic literature, we may remember that the plays of *Richelieu* and the *Lady of Lyons* were produced by him in two following years as manager of Covent Garden Theatre. Indeed we may almost say that when Mr. Macready ceased to be a manager, modern England ceased to have any dramatic literature worthy of the name. He conducted successively the two national theatres upon sound principles, and with practical ability, and the result was that he lost a large sum of money. It is enough to say in his praise that there has been nothing like his management since he retired, and there never can be anything like it again. There might be another actor of equal talent, although hardly of equal opportunity, but there could not be another manager with equal materials for efficiently performing the highest class of plays. Mr. Macready was strongly sensible of the evils of theatrical monopoly, and we have fully experienced in recent years the evils of theatrical free-trade. Formerly a manager presided over a complete company, but now every actor of any mark requires a theatre for himself. It is bad enough when a playbill comprises only one good actor, but it is worse when a play is composed with only one good part. Yet the first duty of a manager is to pay his way, and many examples show that the pursuit of excellence in dramatic art leads to bankruptcy. Mr. Macready was not only a manager, but the foremost actor of his time, and modern managers are more likely to imitate him in losing than in making money. They have no resource to look to beyond their nightly receipts, and they are driven to adopt a hand-to-mouth policy, which is almost necessarily antagonistic to genuine art. Under such conditions we ought to bear patiently great evils, and to be thankful for any small qualifying good. If Mr. Macready and his company could be restored to Drury Lane Theatre, we could hardly expect him to go on sacrificing his resources at the rate of 5,000*l.* a year for our intellectual gratification. But now that he has closed a long and honourable career, it becomes us to remember that he incurred private loss in rendering a great public service. We may well stand as mourners round his tomb, for he was the last of a great race of actors, and the glory of the national theatre must be buried along with him.

It was the good fortune alike of Mr. Macready and of the pro-

fession which he adopted that he received a liberal education before learning the business of the stage. Whatever may be thought of classical study as a preparation for other professions, there can be no doubt of its utility to an aspirant to the highest honours of the theatre as it used to be. When Mr. Macready's father sent him to Rugby, he did not desire that he should become an actor; but if he had wished him to become a successful actor, he could have taken no better step. The value of classical scholarship to a tragedian is obvious, and, besides, a man who has been educated at a public school is probably a gentleman, and an actor who is to play kings and nobles ought to be a gentleman to start with. The embarrassments of Mr. Macready's father brought him at seventeen years of age face to face with the realities of life. He was thus forced into connexion with the provincial theatres of which his father was manager, and by stress of circumstances rather than by free choice he entered the profession of which he became the head. He might perhaps have done better for himself in one of the professions which are called learned, but he could hardly have done as well for society, of which as an actor he became a delight and guide. His career commenced in 1810 and terminated in 1851. The first part he played was Romeo and the last was Macbeth. He found the stage occupied by the Kembles, Kean, and Young. He succeeded to the kingdom where they had ruled, and after him came anarchy. The best testimonial that any actor of tragedy could produce in recent years has been that he was a member of Mr. Macready's company at Drury Lane Theatre in 1841–2. Mr. Phelps was a member of this company, and we know what he has done at Sadler's Wells and lately at the Princess's Theatre. Mr. Ryder was another member of it, and to him as stage manager much of the success of Mr. Tom Taylor's play '*Twixt Axe and Crown*, at the Queen's Theatre, was due. Mr. Anderson, who used to play Othello to Mr. Macready's Iago in the same company, was, we believe, last seen in London about two years ago. The Desdemona of that company was Miss Helen Faucit, while the leading actresses for comedy were Mrs. Nisbett and Mrs. Stirling. We cannot mention the name of Mrs. Stirling without remembering that, in an excellent performance of the *Rivals* lately at the Charing Cross Theatre, that lady played admirably the part of Mrs. Malaprop. More than thirty years have passed since Mrs. Nisbett and Mrs. Stirling played Rosalind and Celia in *As You Like It* with Mr. Anderson, who had youth and strength for wrestling or any other sport, as Orlando, and Mr. Macready himself, or Mr. Elton, who was afterwards unfortunately drowned, as Jacques. Mr. Ryder was the Duke in the same cast; the late Mr. Keeley was Touchstone; and Mr. Compton, who is now playing at the Globe Theatre, was William. Most of us remember Mr. Keeley, and we can see Mr. Compton any night we please; but it is easy to imagine how the one would talk and the other look as Touchstone and William. This play was acted with sufficient scenery and decoration, but the accessories were not made more important than the play itself, as has become the fashion in recent years. If all the surviving members of Mr. Macready's company were willing to act together for a night next week, it would probably be said that either the play they might select must be produced shabbily, or the manager must lose money by what ought to be a promising speculation. This perhaps is the most annoying of the changes which have happened since Mr. Macready's time. Whatever else we get at a modern theatre, we never get variety. Thirty years ago there were persons who held boxes or season tickets at Drury Lane Theatre just as they are now held at the Opera, and some of these persons occupied their places nearly every night. You might see *Othello* one night, *As You Like It* the next, and perhaps *Richelieu* the third, and there was always a screaming farce after a tragedy. The musical department also was very good, and the performance of *Acis and Galatea* under Mr. Macready's management is still spoken of as unsurpassed. We ought not to mention music without noticing that Miss P. Horton, who is still a great favourite with the London public, was Ariel when Mr. Macready produced the *Tempest*. In effect there were three companies at one theatre, and we should not complain if the same quantity of talent were now distributed among three, or even six, different houses. But we get nothing like the completeness in all parts that marked the performances which Mr. Macready directed; and, besides, there has never been since his time such a school as he provided for rising actors. Mr. Charles Kean revived Shakspeare almost too gorgeously at the Princess's Theatre, and indeed he may be said to have "inaugurated the era" of upholstery in tragedy. He was perhaps rather too apt to think that himself and his wife, who certainly could do a great deal, could do everything with the help of scene-painters and tailors. Thus a sort of partnership was established between tragedians and tradesmen, in which latterly the tradesmen have become the more important members. We ought not to say that the public taste is wholly vitiated when the *School for Scandal* has been played, and very well played, for upwards of two hundred nights, and the *Rivals* was played contemporaneously, and also very well, for more than fifty nights. Lord Lytton's *Money* has been only lately withdrawn, after a run of many months, and as that play was never very brilliant, and has long since lost the charm of novelty, the attraction must have lain principally in the acting. Comedy, therefore, still flourishes on our stage, but tragedy has reached a pitiable condition of weakness to which death would be almost preferable. For leading actors in tragedy we must look almost exclusively to the surviving pupils of Mr. Macready, while it is almost impossible to fill the minor parts satisfactorily. We can hardly expect young men of talent and education to enter a profession which neither confers wealth nor promises fame. If a young man who had passed with credit through a public school were disappointed of the hope of going to college, and felt the want of an immediate maintenance, it would not now occur to him to seek it upon the tragic stage. There has appeared during the last few years more than one promising Juliet, but we doubt whether there has appeared a Romeo of equal, or indeed of any, talent.

Amid all the comforts and luxuries which have multiplied with the growth of national wealth, it is permissible to look back with regret to that ruder and poorer time when one could go any night for three shillings to the pit of a theatre, and see Shakspeare well performed. The theatres were in those days the centre of an intellectual society which dwelt within two miles of them. Mr. Macready, as manager, had the sympathy and support of the foremost men in literature and art, and even those who adversely criticized his acting bore emphatic testimony to the value of his attempts to rehabilitate the poetic drama. It is enough to say in his praise that playgoers look back through more than thirty years to his management as to a model of hopeless, unattainable perfection. They have seen *Formosa* at Drury Lane, and *Babil and Bijou* at Covent Garden, and they have consoled themselves with the belief that after the lowest ebb has been reached there must come a flood. In honour of the memory of Mr. Macready some special effort should, we think, be made to revive, even if it could be only for a few nights, the sort of performances that he would have approved. We may remember or imagine the performances which he directed; but it would be well to place before younger playgoers some reproduction, however feeble, of our dreams or memories. If by the retrenchment of upholstery it were possible to produce several plays, the rising generation might be infused with some slight idea of the effect of a powerful performance of *Julius Cæsar*, *Lear*, or *Macbeth*. Something ought to be done to commemorate the services of Mr. Macready to literature and morality. The name of one "who made a nation purer through his art" is not likely to be forgotten in the list of great and good men who have been schoolboys at Rugby. He owed much to early training, and he has paid the debt by the lustre which his career reflects upon the school which trained him. Under his rule the theatres fulfilled the promise of their patents, that they were instituted "for the promotion of virtue, and to be instructive to the human race." It was not by accident that the poetic drama grew to its highest prosperity in England during a long and arduous, and ultimately triumphant, war. The temper of men's minds in 1814 was well adapted to be influenced by the ardent genius of Kean. We cannot reproduce, except at the price of equal sacrifices and sufferings, the feeling of society "when hope long doubtful soared at length sublime," and therefore, if we had another Macready, we could not place him in the circumstances necessary to success. Great men are nurtured amid great events. Mr. Macready's birth was coincident with that of the first French Republic, and he survived the Second French Empire. When for the last time in public he spoke the lines—

> I have lived long enough; my way of life
> Is fall'n into the sear, the yellow leaf—

he could not have hoped to be able to look back upon his farewell of the theatre through more than twenty years' enjoyment of the love and honour that should accompany old age. He exceeded the common lot of man alike in the duration and varied experience of his life:—

> We that are young
> Shall never see so much, nor live so long.

MR. O'KEEFFE ON ULTRAMONTANISM.

WE have never expressed any opinion on the details of Mr. O'Keeffe's quarrel with Cardinal Cullen, nor do we intend now to prejudge questions which will shortly be brought before the legal tribunals in Ireland. That he has been treated in an arbitrary and oppressive manner by his ecclesiastical superiors is what most Englishmen will be ready to believe, and if it should turn out that they have kept within the letter of the canon law, by which they profess to be bound, the general comment of outsiders will probably be, "so much the worse for the law." Mr. O'Keeffe of course contends that they have overstepped their canonical rights in their eagerness to crush an obnoxious opponent, but we are as yet only imperfectly acquainted with the grounds on which his contention will be maintained. Meanwhile he has come forward with a sort of general vindication of his position in the shape of a letter to the *Times* on Ultramontanism, which may be considered on its own merits, and quite apart from any bearing it may be supposed to have on the technicalities of the case. It seems to have been immediately occasioned by a somewhat Hibernian mare's nest of Mr. Mitchell Henry's—who has since defended himself by appealing to a precisely similar blunder of Dean Stanley's—about the meaning of the term "Ultramontane." A very moderate knowledge of etymology might have sufficed to convince them that the term, when used by Italians, must necessarily refer to opinions prevalent North of the Alps, and, when used by Northern Europeans, to opinions prevalent in Italy; nor would it require a more profound mastery of history to establish the inference that in the former case it signified anti-Papal, or what used to be called "Gallican" and "Cis-

alpine," views, and in the latter case what is now commonly understood by Ultramontanism. The "strange perversion" of the name, of which Mr. Mitchell Henry complained, exists only in his own fanciful explanation of it. Mr. O'Keeffe is also fully justified in asserting that "the two schools have been always considered orthodox in the Roman Catholic Church," at least up to July 18, 1870. His extract from Fleury gives a tolerably correct rough summary of the substance of the "Gallican Liberties"; but when he goes on to observe that the Council of Constance "set aside three Pretenders to the Papacy," and put Martin V. into their place, he materially understates his own case, both by omission and inaccuracy. The Council of Constance deposed the reigning Pope, John XXIII., who was not a pretender at all, for his crimes and contumacy, besides getting rid of the two anti-Popes. And it also passed a decree, to which we shall have occasion to revert presently, of far more importance in its theological aspects even than this high-handed assertion of sovereign authority in the Church.

The main point of Mr. O'Keeffe's letter, however, is comprised in his reference to what he calls the "famous Resolutions of the French clergy in 1682," commonly known as the Four Gallican Articles, or the *Declaratio Cleri Gallicani*, of which he gives a brief summary. And here we may pause for a moment to recall the origin of this truly "famous" manifesto of the French Church in its palmiest days. The Declaration is often spoken of as Bossuet's, and so far rightly, that it embodied his belief, and that he wrote an elaborate defence of it. But its real originator was the Minister Colbert, who persuaded Louis XIV. that a seasonable opportunity had arrived for publishing a formal statement of the rights of the Crown and of national Churches as against the claims of the Papacy. He enlisted the sympathies of Dr. Harlai, Archbishop of Paris, and the Archbishop of Rheims, and the drawing up of the Report to be presented to the Assembly of Clergy was entrusted to De Choisseul, Bishop of Tournay. It was a masterly document, tracing out the constitution of the ancient Church down to the ninth century, and the gradual encroachments of the Roman Curia on the strength of the False Decretals. The Assembly received it unanimously, and directed the author, in conjunction with Bossuet, to compile the formal Declaration based upon it. But they were unable to agree in their views about infallibility. Bossuet, while denying the infallibility of individual Popes, maintained a theory, more high-sounding than intelligible, on what he called the infallibility, or, as he explained it, when pressed, the indefectibility of the See of Peter. Individual Popes might err from the faith, but, in the long run, the See of Peter would never be suffered to fall away. This view, if less logically coherent than the more extreme doctrine subsequently enunciated by the Vatican Council, had the convenience of avoiding many historical difficulties, while it was far less onerous in practice. Dr. Choisseul, however, with more consistency—and, as the event has proved, with a clearer prescience of the tendencies of either system—denied Papal infallibility, whether of the person or the see, altogether. So Bossuet was left to draw up the Declaration by himself. It was signed by the thirty-four bishops and thirty-four clergy of lower rank composing the Assembly, ratified by the King, registered by the Parliament, and ordered to be taught in all universities and colleges throughout France, and subscribed by all professors. The Pope was furious, and threatened a formal censure, on which Bossuet made the not very dutiful remark that "good intentions, combined with slender enlightenment, were a great misfortune in so exalted a position," and in his instructions to his envoy at Rome he insisted on the fatal results of throwing over the Council of Constance. Antoine Arnauld entirely sympathized with Bossuet here, and expressed his "pity" for the See of Rome finding such champions as, for instance, Ceroli de Cerceto, who deduced from the sovereignty of Christ over the whole world the supremacy of the Popes, His Vicars, over all Kings and secular Governments. Innocent XI. found it prudent to abandon his intention of issuing any formal censure against the Declaration; but bulls of institution were systematically refused to the newly-appointed French bishops, till at last no less than thirty-five sees were left vacant, the Chapters committing the administration of the diocese to the unconsecrated nominees. Meanwhile Bossuet was engaged in composing his great treatise in vindication of the Four Articles, *Defensio Declarationis Cleri Gallicani*, which was completed in 1685, but, by the King's desire, not published. It first saw the light in 1730, many years after his death, in an incorrect and unauthorised form, and in 1745 was published in its proper shape, as it finally left the hands of its illustrious author. There can be no doubt whatever of its authenticity; indeed the original MS. was discovered in 1812, in the Royal Library at Paris. Its appearance greatly disconcerted the Ultramontane party, who were anxious to get it officially condemned; but Rome trembled at the name of the great apologist of Catholicism, and Benedict XIV., far the ablest of recent Popes, pointedly declined to pronounce any formal censure. To this day it remains unanswered and uncondemned, except of course implicitly by the Vatican decrees.

Mr. O'Keeffe gives the following abstract of the Four Articles:—

"1. That Kings and Princes are not subject in temporals directly or indirectly to the ecclesiastical power, and that they cannot be deposed by authority of the chiefs of the Church, nor their subjects absolved from due allegiance.

"2. That the decrees of the Council of Constance on the authority of general councils ought to remain in full force; and that the Church of France does not agree with those who think these decrees are doubtful, or only made for the time of schism.

"3. That the exercise of ecclesiastical power ought to be regulated by the canons; that the rules, customs, and laws received in the Gallican Church ought to be observed in it.

"4. That, though in questions of faith the Sovereign Pontiff has the chief part, and that his decrees regard all the Churches, his judgment, however, is not irrefragable, if not followed by the assent of the whole Church."

This summary is tolerably correct as far as it goes, except that in No. 3, for "ecclesiastical power" should be read "apostolic (i.e. Papal) authority." And this is the clause that most closely touches on Mr. O'Keeffe's own case. When the "Papal aggression," to which he refers further on, took place, it was supposed that the creation of the new hierarchy in England would be followed by a regular parochial organization; for a diocesan episcopate, as distinguished from the government of Vicars Apostolic, is always supposed to connote, as the logic books say, the establishment of ordinary parishes, with canonical rights of parish priests. But the See of Rome, which had been ready enough, in the Concordat with Napoleon, to sweep away all existing parochial rights in France by a stroke of the pen, did not see any necessity for introducing this part of the diocesan system into England; and the new bishops, we need hardly say, were not anxious to press on its attention the propriety of limiting their own arbitrary powers. There are, accordingly, no Roman Catholic parish priests, in the sense of the canon law, in England to this day. But in Ireland, where the old diocesan organization has never been interrupted, the old rights of the *parochi* are also supposed to remain in force. And here, we presume, will lie the strength of Mr. O'Keeffe's position. If Papal authority can only be exercised in accordance with the canons, Cardinal Cullen may find it difficult to justify his summary mode of procedure. But, without pronouncing any opinion on the issue of the approaching trial, we cannot but observe that the zealous champion of ecclesiastical independence has left one vulnerable point in his armour. While adhering to the first three Gallican Articles, he announces his abandonment of the fourth, which, as he justly observes, has been condemned by the Vatican Council, whose decrees he conceives that every Roman Catholic ought to admit. How that may be we need not here discuss: it is of course notorious that a large and growing number of Roman Catholics do not admit them. But what has apparently escaped Mr. O'Keeffe's notice is that the Vatican Council has just as emphatically condemned the second, if not also the first and third, of the Gallican Articles as the fourth. If the decrees of Constance on the authority of General Councils are to remain in force for all time—and this is surely an obvious corollary from the infallibility of General Councils—the decrees of the Vatican are expressly condemned by anticipation. For what is the famous decree of Constance, sanctioned by Pope Martin V. and several of his successors and by the Council of Basle? "Every lawfully convoked Œcumenical Council, representing the Church, derives its authority *directly from Christ*, and every one, the Pope included, is subject to it *in matters of faith*, the healing of schism, and the reformation of the Church." A more pointed denial of the infallibility and supreme ordinary jurisdiction of the Pope, which are the two points defined at the Vatican Synod, could hardly be put into words. But if this doctrine is to be superseded, and every Roman Catholic must believe the Pope infallible, we must confess that the opponents of Ultramontanism appear to us to enter the contest so very heavily weighted that their chances of success are inappreciable. What avails it to appeal to "the Cisalpine spirit of a Murray and a Doyle," both of whom solemnly on oath repudiated Papal infallibility before a Committee of Parliament, or to lament the want of "an Irish prelate more Catholic than Roman," when that Cisalpine spirit has been distinctly branded as heretical, and to be more Catholic than Roman is to aspire to be greener than the grass and more blue than the azure of a cloudless sky? Mr. O'Keefe should remember that on Vatican principles the measure, and the sole measure, of true Catholicism is identity with Rome. As Pius IX. happily expressed it, *Tradizione sono io*. He holds all truths and all laws, as another Pope has worded it, *in scrinio pectoris sui*. It is surely obvious that Infallibility must be a law unto itself.

THE ROYAL ACADEMY.

1.

THE present Exhibition is a fair average and nothing more. There is scarcely a picture that will take the public by surprise, there is hardly an artist who will create a sensation by surpassing the standard of excellence he has reached in previous years. The utmost that in charity can be conceded is that the collection is pleasing and varied, and that the rooms are balanced with more than usual taste. Little or nothing in the way of novelty or innovation upon traditional respectability and established mediocrity calls for notice, save the continued and accelerated decadence which marks the grand central Gallery in consequence of its being reserved as the appointed field wherein certain Royal Academicians are privileged to prove their lack of genius. From year to year it becomes more and more intolerable that insane creations should be placed conspicuously to represent English art. Yet perhaps we may take it as consoling evidence of a vitality which nothing can destroy that Mr. Hart, R.A., is comparatively innocuous, although he claims as of right a place on the line for a screaming horror termed "The Conference between

Manasseh Bén Israel and Oliver Cromwell" (322). This picture is hard as stone, while its neighbour, "Eliezer and Rebecca at the Well" (315), by Mr. Thorburn, A.R.A., is weak as water. We wish it were possible to bury in this, the Poets' Corner of the Academy, a direful work by Mr. Cope, R.A., "Mary Magdalene at the Sepulchre" (309). Mr. O'Neil also has long merited the last reward of labour, and certainly he will have done something more towards paving the path to oblivion by a speedily to be forgotten composition of that trite theme, "Tintoretto painting his Dead Daughter" (246). It is perhaps too much to expect that those and other artists should deny themselves the last infirmity of noble minds; still it is a pity that ambition is not made of sterner stuff, and, at any rate, the love of fame might be tempered by a self-knowledge which should restrain the painter from perpetrating works which only prove his weakness. On this day will assemble a distinguished company of men of state, of letters, and of science, who here, in the Banqueting Hall of the Academy, will, as a matter of course, pay graceful tribute to the ability of our English school. It is much to be regretted that, under existing rules, works of mediocrity which come from the members cannot be shunted.

The guests of the Academy will however doubtless exercise the worldly tact which knows how to seize on the most agreeable topics. And, if we mistake not, attention will especially be directed to one of the most artistic and pleasing pictures of the year, "Subsiding of the Nile" (292), by Mr. Goodall, R.A. This artist has in seasons past made us familiar with the ancient monuments and the modern inhabitants of Egypt, but never do we remember from the same easel a picture so lovely and impressive for scale and distance, for silvery haze in atmosphere, and for the silence which reigns habitually in the Desert. The spirit of tranquil beauty rests on this canvas. Then, again, notice must of necessity be taken of the noble group, "After the Expulsion" (282), by Mr. Elmore, R.A. To paint Eve is always to encounter no ordinary difficulties, but the triumph has been complete; the treatment is refined, the form is instinct with beauty. The post of honour has been reserved for Sir F. Grant, who, as president at the annual dinner this day, will be in the way of praise for his equestrian portraits of the Earl and Countess of Coventry, presented by two hundred and forty-five friends "who have had the pleasure of hunting with his lordship's hounds" (212). But such subjects are hopeless save in the hands of painters such as Rubens, Vandyck, or Titian—from whom Sir Francis, by general confession, stands at a respectful distance. Also conspicuous is another large equestrian portrait, "A Sketch of Her Majesty the Queen" (256), by Sir Edwin Landseer, R.A. It seems to us a question whether a work avowedly very far from completion should not have been withheld altogether; and visitors, it is to be feared, are likely to feel all the more acutely the absence of the three Miss Armstrongs who signalized last year's Exhibition, inasmuch as Mr. Millais has not been able to supply any adequate substitute. And yet the portrait of "Mrs. Bischoffsheim" (228) is in its way triumphant. Among many masterly portraits of the year by Mr. Millais and others, none is so defiant in bravura of brush and daring concatenation of colour. But Mr. Millais has contracted a mannerism of which, we fear, he can scarcely fail in the end to become the slave.

This introductory article will be best devoted to a general summary of the contents of the exhibition. The visitor on entering the first Gallery will be astounded by one of the grandest landscapes of modern times, "A Lion in the Path" (28), by Mr. Poole, R.A. The manner has the breadth, the boldness, and the wide imaginative sweep of the Old Masters; only figure-painters can throw into nature such dramatic intensity. Wild, too, is "The Wind" (64), as the storm rages and the torrent roars in the Highlands—a picture which not even Mr. Peter Graham, the painter, has ever surpassed in power. Its companion, "A Coming Storm" (78), is the only example of the grand manner of John Linnell the elder. "The Fountain" (72), around which graceful girls are posed, cannot be accepted as the strongest work of Mr. Leslie, A.R.A. This picture, together with portraits by Mr. Watts, R.A., and further portraits by Mr. Millais, R.A., will fall under notice on a future occasion. Landscapes and portraits constitute the strength of the first Gallery. The next room in succession is weak; but here again landscapes and portraits assert themselves powerfully. Among the former is Mr. Vicat Cole's "Haytime" (114); this fine study of foreground and middle distance occupies the central spot which the artist held by his master-work of last year. On the same wall hang with good effect a scene "In the Isle of Wight" (122), by Mr. Birket Foster, and "Ramsey Island" (107), by Mr. C. P. Knight. Among figure-painters Mr. Frith, R.A., is not at his best. Mr. Webster, R.A., Mr. Storey, Mr. F. D. Hardy, M. Frère, and Mr. Clark, make this room the stronghold of genre painting. Moreover, the walls are enlivened by certain eccentricities which of late years have become the vogue. But we are all indebted to Mr. Albert Moore and others for breaking the dull monotony, the dreary mediocrity, which rule for the most part in these Galleries. On the whole, classic and mediæval manifestations this year dwindle into a smaller minority than heretofore. Yet our English school has gained so much by these innovations that we wish them to be wisely directed rather than wholly destroyed.

We have already described in brief the aspect of the third Gallery, or Banqueting Hall, and so now cross over to Gallery IV. In passing round the walls again the suspicion grows of weakness and of well-balanced propriety. The Academy, we trust, will live too long to die of dignity, yet some people prefer the free outspoken naturalism and caprice permitted to the Dudley Gallery on the opposite side of Piccadilly. But the Dudley Committee have not yet invited the Ministry and the Bishops to dinner, and therefore do not command the fashion and the prices which more and more favour Burlington House. In Gallery IV., again, we find landscapes so fairly treated as to lead to the inference that the Academy has at last resolved to redeem its character. "Mountain Solitude" (379), by Mr. Leader, "The Graves o' our ain Folk" (336), by J. Smart, A.R.S.A., "Trawlers Waiting for Darkness" (386), by Mr. Hunter, and "Steeple Rock, Kynance Cove" (419), by Mr. Cooke, R.A., are landscapes of a character and power which hold more than their own in competition with the neighbouring figure pictures. Among the latter we shall hereafter have to notice "Jack Ashore" (329), by Mr. Hodgson, the newly elected Associate, "La Levée de Monseigneur" (346), by Mr. Calthrop, "Chatterton" (361), by Mrs. Ward, "The Ethnologist" (380), by Mr. Marks, A.R.A., "The Landing of Charles II. at Dover" (400), by Mr. Ward, R.A., and "A Flag of Truce" (401), by Mr. Pettie, A.R.A. The next Gallery, No. V., leaves but little impression. Here again, however, by a pleasing, well-balanced variety, wherein each picture takes its fitting place as if painted for the post it holds, we are led to the conclusion, not only that the hangers had ample materials out of which to make their choice, but also that they did not hesitate to reject wholesale what they did not want and could not work. On this assumption it can easily be understood how the rooms have been brought together into pictorial and decorative harmony. That the individual sacrifices have been great beyond the average seems proved by the unusual number of rejected works. In this fifth and subordinate Gallery, the chief pictures are "Over the Heath" (447), by Mr. W. Linnell, "Summer Afternoon" (453) by Mr. Davis, the newly elected Associate, "Finished Study for the Head of Lear" (487), by Mr. Herbert, R.A., and "The Path of Roses" (517), by Mr. Yeames, A.R.A.

Galleries VI. and VII. more than sustain the standard of the preceding rooms; indeed it is evident that anxious care has been taken that at no point shall the interest flag or the merit die out. A terrific, but formal fight, conducted strictly according to Academic discipline, "between More of More Hall and the Dragon of Wantley" (541), reinstates Mr. Poynter, A.R.A., in the position which he endangered by the companion picture of last year, "Perseus and Andromeda." The large, studious, and noble work now exhibited is one of the chief features of the Exhibition. On the opposite wall, also commanding the central position, is "The First Prince of Wales" (593), a composition which once more proves Sir John Gilbert the not unworthy disciple of Rembrandt and of Rubens. The corner Gallery, No. VII., which has usually been well cared for and strongly pronounced in character, struck us as being remarkably well massed and managed by the hangers. The greater part of one wall is in possession of landscape, an art of national significance which has never been made more honourable than in the present year. A place of distinction is fitly given to a sober and solid study. "Amongst Granite Boulders" (681), by Mr. Brett. Around this central work are ranged "Borrowdale" (677), by Mr. Hering, "The Vocal Memnon" (676), by Mr. MacCallum, and "Dordrecht and the Meuse" (682), by the well-known Belgian painter, M. de Schampheleer. To the Dutch artist, M. Israels, we owe one of the most simple and pathetic compositions of the Academy, "The Poor of the Village" (684). And here we may take occasion to say that foreign pictures have this year been interspersed with judgment; the examples are well chosen and not too numerous.

Gallery VIII. is, as usual, devoted to water-colours. Galleries IX. and X., with which the oil pictures close, maintain to the last a merit which seems to indicate that the Academy could have further extended the exhibition had space permitted. An increase, however, were it practicable, is to be deprecated on divers grounds; the quality must in the end deteriorate; besides, the endurance of the public could scarcely be expected to hold out. The quantity already given is assuredly ample, the quality only is deficient; and merit cannot be raised except by the accidental birth of genius, or by the slow process of education. In rapidly scanning these last rooms we cannot bring ourselves to admire Mr. Prinsep's choice of a subject—the herd of swine running violently down a steep place into the sea (988). Here is one of these numerous cases in which a written narrative does not bear to be thrown into a pictorial reality. Hence the established distinction between poetry and painting. That the artist has been signally successful in bringing the incident vividly home to the spectator proves all the more irresistibly that the scene is not within the sphere of art. In short, it becomes a question whether swine ought to be painted at all; there is too much beauty in the world to make it worth an artist's while to depict unclean beasts. In the tenth and last room it is impossible, even on the most cursory survey, to overlook either "The Heir" (1062), by Mr. Boughton, or "The Mountain joyous with Leaves and Streams" (1026), by Mr. Alfred Hunt. But if we were asked which work has here left the most indelible mark on the imagination, we should name the grand and ghastly composition by M. Alma Tadema, "The Death of the First Born" (1033). Also abiding in the memory for its loveliness is Mr. Leighton's design illustrative of "The Arts of Peace" (1270). Of these compositions, as well as of others, which we have not found space even to enumerate, we shall treat hereafter. Of "the rejected" it is not our province to speak save in com-

miseration. But the anomalous fact may be worthy of note that the works refused, as well as the works admitted, have been this year beyond all precedent. We are sorry for the unsuccessful, yet without rejection little value would be set on the privilege of admission.

THE TWO THOUSAND GUINEAS.

VERY little happened on the first day of the First Spring Meeting to influence in any way the great event of the week. The Two Thousand Stakes Trial Plate brought out only four runners—Cobham, Tourbillon, Fontarabian, and Hughenden, and a good race between the first two ended in favour of Cobham. The very bad performance of Fontarabian might at first sight have jeopardized the position of Gang Forward, who was beaten at Doncaster by Sir J. Hawley's horse; but, on consideration, that race could be entirely neglected. It was Gang Forward's first appearance in public, and it was the first race on the St. Leger day. There was an immense concourse of people, and the officials had hardly settled down to their work. The mob crowded into the course so much that the horses were almost shut in, and Gang Forward's first experience of racing was not calculated to encourage a beginner. His subsequent performances fully made up for his first and only failure, and each time he ran he gave evident signs of improvement. The Prince of Wales's Stakes had no direct bearing on the Two Thousand, but The Colonel ran well enough in it to satisfy the admirers of Hochstapler that their champion's maiden victory was gained over one horse, at least, who was not absolutely worthless.

We may proceed at once to the Two Thousand day, which opened very inauspiciously for the French stable. First of all, Drummond was beaten easily by Alava; the distance, two miles and a quarter, being too far for M. Lefèvre's quondam Leger favourite, even against so moderate an opponent as Alava. Then Borély, who, it was generally said, was one of the horses that took part in Flageolet's trial, was defeated by Alaric and Hannah; Orphelin fils ran out of the course, a circumstance that has never before, so far as we are aware, happened to any horse ridden at Newmarket by Fordham, and John was beaten far away by Chopette and Meleurge. These successive defeats of M. Lefèvre's representatives could not fail to have a depressing effect on Flageolet, about whom ominous rumours were afloat, and whose position among the leading favourites became weaker and weaker every hour. Indeed towards the end nothing would go down but Kaiser. His success was looked upon almost as a foregone conclusion, and not only Flageolet, but Gang Forward and Somerset also, lost ground at the last. The scratching of Paladin had removed one competitor who, on last year's running, promised to be formidable; but who, we must conclude, has been discovered not to have made the improvement necessary for the maintenance of his position among the leading three-year-olds. The field ultimately dwindled down to ten, the smallest for nine years, save in Macgregor's year, when the same number started. It consisted of Flageolet and his stable companion Trombone, whose mission was to make a strong pace, Kaiser, Suleiman, Somerset, Andred, Doncaster—Mr. Merry's representative—Boiard (a genuine French horse), Lord Mayo, and Gang Forward. We need not recapitulate Kaiser's performances in this place. It is sufficient to say that, despite many defeats, as, for instance, in the July and Criterion Stakes, he ran throughout last season like a good honest horse, and his dead heat with Surinam—to whom he was giving 4lbs.—for the Middle Park Plate, with the cream of the two-year-olds behind him, was quite sufficient to establish him in the position which he has ever since maintained. Flageolet's great triumph was in the Criterion Stakes, which he won from Paladin, Kaiser, and Surinam, giving 2lbs. to Paladin and receiving 3lbs. from Kaiser. His previous victories over Amalie von Edelreich and Lord Mayo were of no great account; but his Criterion victory, which was accomplished by sheer gameness and staying power, stamped him as a racehorse of superior class. The impression left on the minds of those who saw him last year was that he had not a very great turn of speed, but would show to advantage over a distance of ground. Somerset showed great speed in the July Stakes, but Kaiser most effectually turned the tables on him at York. His appearance and action were those of a horse adapted to short courses, and, as will be seen, his performance last Wednesday supported the view taken last year of his capabilities. Gang Forward was never defeated after the mishap that befell him at Doncaster. He ran four times subsequently, and won the Boscawen Stakes at Newmarket First October Meeting, beating Surinam by a head; the Twenty-fifth Triennial at the same meeting, beating Paladin by a neck; the Glasgow Stakes at the Houghton, beating Andred and Surinam; and walked over for a 500 Sovs. Sweepstakes at the same meeting. These races were all won by Gang Forward through gameness and resoluteness at the finish, and each time he came out his friends had fresh confidence in his powers, and in his good will to use them. Suleiman won two good Nursery handicaps late last autumn, and Andred's form has been shown within the last fortnight by his defeat in the Biennial by Negro. On the whole, the two-year-old running of last year showed that there were four or five horses whom it would be difficult to separate from one another, but that Kaiser's form was perhaps a little the best. It was more probable, however, that they were a lot of fair second-class horses than that there was one first-class one amongst them. Most likely future running will show that, as three-year-olds, their standard is not altogether up to the average.

Though there were only ten starters for the Two Thousand, it was as difficult as ever to find out where they were or where they would be saddled. In the Birdcage only five out of the ten were visible, but among the five was Flageolet. No fault could be found with his appearance, and no complaints could be made about his want of improvement during the winter. Doncaster, the highly bred son of Stockwell and Marigold, did not attract much attention, but he ran well enough in the race, considering his backward preparation, to deserve notice hereafter. Trombone, Boiard, and Andred were the remaining horses saddled near the Cesarewitch Stand, so that it was but a meagre parade there before a great race. Kaiser and Gang Forward were saddled at the Ditch Stables, and those who galloped down to see the preliminary canters reported that Kaiser's condition was perfect, while Gang Forward made no new friends, if he made no new enemies. He receded, however, in the quotations up to the last moment, while Kaiser became firmer and firmer. With so small a field there was naturally not much difficulty in effecting a start. It took a little time to induce the crowd of eager horsemen who accompanied the competitors to the post to settle down in their proper places out of the running track; but when once that was done, the starter's task was easy. There were one or two hasty attempts to break away, and then the flag fell. The pace was fast all through, and Trombone did what he could to serve his stable companion. The fast pace soon found out which of the ten could stay a mile and which could not; and at an unusually early point in the race more than half the field were in trouble. Somerset and Andred retired at the Bushes, and Lord Lonsdale's expensive purchase is evidently content with a six-furlongs course. At the top of the hill Kaiser and Gang Forward came out, and Flageolet attempted to join issue with them at the same moment; but, to the consternation of his supporters, he failed to improve his position, and his boasted staying powers were found wanting. Suleiman, who had also occupied a prominent position to the top of the hill, had to be ridden hard as he descended it, but answered gamely to the calls made on him. It had clearly become, however, a match between Gang Forward and Kaiser, and in the dip Kaiser was going as easily as Cremorne last year at the same point. Directly they breasted the hill Gang Forward closed, and a punishing struggle up the final ascent ended in favour of Mr. Crawfurd's horse by a short head, the very last stride just making him the victor. Suleiman, who might have been nearer, was three lengths behind Kaiser; Boiard was fourth, Doncaster fifth, Flageolet sixth, and Andred, Somerset, Trombone, and Lord Mayo formed the rearguard. In justice we ought to say that Lord Mayo was the rearguard all by himself; for, according to a published report of the time of the race, the winner covered the distance in 1 min. 46¼ sec., while Lord Mayo arrived at the judge's chair in 2 min. 5 sec. The winner's time was very good, compared with the time of the last few years; but we confess that we have little faith in time tests, and still less in the accuracy of the people who are supposed to keep the time. The first two horses deserve all the credit that can attach to the positions they occupied. Nothing could be fairer than the tussle for victory between them, though Kaiser, if anything, showed a slight inclination to swerve towards the finish. But a horse sometimes appears to be swerving when, in reality, his jockey is unable to keep him quite straight; and it is an axiom in racing that the strongest rider makes the straightest horse. It has been hard luck for Mr. Savile not only to lose the Two Thousand last year—for which Prince Charlie might have been disqualified—but to miss the City and Suburban and Two Thousand this year also, when both prizes seemed with his grasp. Yet, if it is true that Kaiser is not within some pounds of what Cremorne was at the same age, he can hardly be accounted a first-class horse, and he has had as much success as a good second-class horse can fairly expect.

Gang Forward has fully established his character for gameness, but it is doubtful whether even the best of the three-year-olds are up to a very high standard of excellence; and if Hochstapler is a little out of the common, he has a good chance of winning the Derby. We may add that Kaiser came down the hill much better than Gang Forward, though he was beaten up the hill by the latter; and that the much severer descent at Epsom may very possibly enable Kaiser to turn the tables on his Two Thousand conqueror. Kaiser is much the more compactly built horse of the two, and, in appearance, better suited to the ups and downs of the Derby course. What are we to say of the wretched discomfiture of Flageolet? He must have lost his form like Paladin; but then Paladin's want of improvement was found out in time, and he was struck out to avoid a disastrous defeat. Why was the same course not adopted with Flageolet? As we remarked last week, there is no more trustworthy trial horse in England than Vulcan; and how well qualified the old horse now is to test the merits of a younger stable companion was shown by his excellent race with Prince Charlie at the last meeting. A wonderful mistake must have been made in the estimate of Flageolet's present capabilities, and M. Lefèvre's Two Thousand favourite has shared the fate of other French horses whose signal defeats in great races are fresh in the recollection of race-goers. Hospodar and Fille de l'Air were not only beaten, but disgracefully beaten, for the Two Thousand Guineas; Stradella, after showing extraordinary form a fortnight before, was nowhere in the Chester Cup; and Drummond's failure last year at Doncaster was just as decisive. Mistakes such as these are made either by having an imperfect trial, or by over-estimating the value of its results. Trials may be overdone, we are quite aware; many a good horse

has been ruined by such trials; and it is well known that owners have occasionally been so staggered by the result of a first trial as to consider it too good to be true, and have thereupon ordered a second and more severe task to be set, under which a good horse has succumbed. That is the fault of over-caution; but, on the other hand, some horses have been indulged in their trials, and their owners or trainers have shrunk from ascertaining the real truth as to their powers, for fear lest the truth should turn out to be not so pleasant as they would desire. Perhaps some such error may have been committed in Flageolet's trial; but, mortifying as it may be to an owner and trainer to see their horse beaten under their own eyes, it must be much more mortifying to witness his defeat in public, and the mortification is not felt in the latter case by themselves alone.

REVIEWS.

ALEXANDER VON HUMBOLDT.*

NO man had ever a greater dislike to his life being written than Alexander von Humboldt. His horror of biographies he described to a friend in his last years as being almost as great as that which he felt for the portraits of old men painted by the sun, although both might, he allowed, be viewed in the interests of science as a disagreeable necessity. In his will he enjoined his dear relatives and friends to prevent, as far as possible, any biographical notice of him from appearing in the public journals, and he expressly desired that the *éloge* usually delivered upon the death of any foreign Associate of the Institute of Paris should be omitted in his case. His representatives having, in furtherance of his wishes, protested against the publication of any confidential letters or papers of his, it seemed at the time impossible to construct a life of Humboldt that should rest upon any authentic and adequate basis of facts. What little was publicly known of the life of the great traveller and philosopher, or of the process of development of his master mind, was in the main derived from a skeleton memoir furnished by Humboldt himself in the year 1850, at the request of the editor, for the *Conversations-Lexikon* of Brockhaus. Fragmentary and imperfect notices of his life and labours have been put forth by H. Kloncke and W. C. Wittwer, and just after the death of its illustrious subject, W. F. A. Zimmermann published his *Humboldtbuch*. It being impossible long to maintain the prohibition laid down by the writer, a series of Humboldt's letters was put forth, within little more than a year, by Varnhagen von Ense, to suit whose propensities for gossip they had been written, and by whom they should by right have been committed to the flames. Piquant as they are, and rich in traits of character and life, these familiar outpourings revealed too much of weaknesses or failings, which, however, shared by even the greatest of men, go far towards making up a truthful image of the writer. The unfavourable impression caused by the untoward and unreserved publication of many secrets was enhanced by the censorious remarks and comments thrown in by Varnhagen himself. Later sets of letters, such as those edited by Berghaus and De la Roquette, did something to bring into prominence the scientific aspect of Humboldt's mind and work. But it was not till the approach of the centenary of his birth that the national interest in him may be said to have thoroughly awakened, stimulated as it was by the advance of Prussia—the once insignificant country of Humboldt—upon the political stage. The meeting of the scientific association at Dresden in September 1868 became the occasion of Professor Karl Bruhns of Leipzig devoting himself to the compilation of an adequate life of the author of *Cosmos*. Scientific friends fell eagerly into the scheme. Letters to Marie Auguste Pictet, to Count George von Cancrin, to Bunsen, and other correspondents of mark, found their way into the pages of periodicals, or were poured in upon the editor. The Humboldt MSS. in the Berlin Observatory were brought out by Professor W. Förster, and the use of the traveller's journals in America and Asia, with his correspondence, was granted by Frau von Bülow, his niece. No fewer than five hundred letters to Humboldt from distinguished personages were supplied by his confidential attendant Seifert, and much matter of value was derived from the archives of learned Societies, as well as from those of the State Departments. The scheme of Professor Bruhns divided itself into two parts. The first part was to contain the story of Humboldt's Life, in three sections, treating of his youth, his manhood, and his old age. The second was to discuss, in eight distinct treatises, the several departments of science to which by his researches he had contributed. We are glad that the second part, made up as it was mostly of extracts from Humboldt's writings, has been omitted from the English edition. The Misses Lassell have given us a clear and readable version of the biography comprised in the earlier part, which supplies, interwoven with the narrative, a sufficiently critical investigation of what the great traveller has done for science. Carefully as the translation has been executed on the whole, it would have gained much from having been subjected throughout to strict revision under some competent hand. Not only would certain failings or solecisms in grammar have been set right, but such queer anomalies or confessions of literary weakness as occasional queries inserted in the text would have been done away with.

The chief interest of the present biography will be felt to lie in the new and additional light which it throws upon the early part of Humboldt's career, his mental training, and the dawnings of that special genius or aptitude for natural study which was so transcendently displayed in after life. It was herein that previous notices had been most strikingly deficient. For the achievements and discoveries of his manhood and age we had, in his published travels and unnumbered works on science, a record of the most eloquent and enduring kind. It was in the nature of his most characteristic writings to fall largely into the form of autobiography. Readers of the *Aspects of Nature* and of *Cosmos* will feel that not much is to be added to the knowledge or the estimate of the man who has taken them in his company over so wide a portion of the earth, and poured out to them his inmost experiences of nature. It was his own expression, that the biography of a man of learning is to be found in his works; and, with all his devotion to his task, Herr Bruhns cannot have found much more to do towards the later portion than to condense and epitomize the all but stupendous products of perhaps the most voluminous writer ever known. The results of Humboldt's travels in America alone, in the shape of journals and treatises, filled, it is said, seventeen folios, nine quartos, and seven octavos; and the list of his entire writings extended to such a length as to induce its omission, much to our regret, from the English edition. For the opening years of Humboldt's life his biographer has to acknowledge the aid of Herr Julius Löwenberg, who had for years been accumulating materials for that purpose. Setting aside much mythical matter which had gathered round the origin and ancestry of the Humboldt family, as having in ancient times settled in Zamenz or Zammenz in Eastern Pomerania, and fought, as stated by Berghaus, in the wars between the Germans and Scandinavians—the name, according to Pott, signifying a Hun of gigantic proportions, and the family wealth having been so vast that the father of William and Alexander von Humboldt bore, in the shape of a loan, half the expenses of the Seven Years' War—we come upon historical notices of the family in the seventeenth century. Johann Humboldt was Burgomaster of Königsberg in the crisis of the Thirty Years' War, dying in 1638. Clemens, his son, bailiff of Neuhoff in the Electorate of Brandenburg, of whom a few particulars are handed down, was great-grandfather of the two illustrious brothers. Nothing of note marked the intervening generations, saving the petition for the patent of nobility, in 1738, by Captain Hans Paul Humboldt, one of whose sons, Alexander George, a major in the army of Prussia, by his marriage with a lady of the old Burgundian family of Von Colomb, the widow of Captain Ernst von Hollwede, came into a large landed estate at Tegel on the Havel, eight miles from Berlin. By her he had a daughter, who died in infancy, and two sons—William, born at Potsdam, June 22, 1767, and Frederick William Henry Alexander, born at 22 Jägerstrasse, Berlin, part of his mother's property, September 14, 1769. Royal personages, including the Prince of Prussia, afterwards King Frederick William II., stood sponsors at the baptism of the younger infant. The premature death of her husband threw at an early period upon the mother—who is spoken of as a good manager, but not marked by genius or force of character—the care of the two boys. Nothing about Alexander bespoke in early life the powers that were to make him great. In frame anything but robust, his slowness of mind caused doubts, as he himself states in middle life, whether even ordinary intelligence would be awakened in him. His first tutor, writes Herr Bruhns, was J. H. Koblanck of Halle, in 1773; though Campe, who had been some years before private tutor to young Hollwede at Tegel, had taught the little Alexander to read and write at three years old, and has generally been held to have inspired the boy from very early years with the passion for foreign travel. His second tutor was Johann Clüsener, afterwards private secretary to the Princess Ferdinand, and counsellor in the local government of Sonnenburg, who was succeeded in 1777 by Kunth, a man of varied culture, with broad and philanthropic views, distinguished in later years by his share in furthering free trade and the formation of the Zollverein throughout Germany. Under Kunth's guidance the young Humboldts had the benefit of the best educational advantages to be had in Berlin, attending the lectures of Fischer in classics and mathematics, and those of Engel and Dohm in general philosophy and political economy. The youths had for their fellow-pupil Joseph Mendelssohn, from whose father Moses they are said to have received valuable attentions. It cannot be said that Alexander made much progress in Greek, since we find him in his nineteenth year, under the tuition of Bartoldi, writing of himself as beginning to decline ἐχίδνα. Flowers and plants, shells and stones, formed his favourite toys or studies; from perpetually collecting, arranging, and labelling which he was called as a child "the little apothecary." He had a marked talent for drawing, and in later life studied in the life school at Paris under Gérard. His portrait of himself, drawn in black chalk in 1814, engraved as the frontispiece to the volumes before us, is one of the best we have. In etching and engraving he had lessons from Chodowiecki, and several impressions from plates of his are extant. For music neither of the lads had the slightest taste or feeling. To William it was simply intolerable, while with Alexander it was "une calamité sociale." The physician Kessler mentions having explained to the lads at Tegel in 1781 the Linnæan system, which William took in readily; not so the younger brother, who himself tells us he had not so much as heard of botany till

* *Life of Alexander von Humboldt.* Compiled in commemoration of the Centenary of his Birth. By J. Löwenberg, Robert Ave-Lallemant, and Alfred Dove. Edited by Professor Karl Bruhns, Director of the Observatory at Leipsig. Translated from the German by Jane and Caroline Lassell. 2 vols. London: Longmans & Co. 1873.

he made, in 1788, the acquaintance of Wildenow, a youth of his own age who had just brought out a Flora of Berlin.

In the intellectual atmosphere of Berlin, where Lessing and Kant were diffusing a higher life of thought, and gifted women like Rahel and Henriette Mendelssohn, married to Marcus Hertz, gathered round them all that was brilliant in literature and art, the young Humboldts rose to man's estate. After ten years under Kunth, who received from Frau von Humboldt a pension of four hundred gold florins for his care of her sons, and who as long as he lived continued to manage Alexander's property, the brothers went to Frankfort, where they matriculated October 1, 1787. It was his mother's wish that Alexander should devote himself to the study of finance, as a preparation for entering the service of the State; but within half a year, while William proceeded to Göttingen, Alexander returned to Berlin. Developing his early taste for botany, he here produced anonymously in French his first literary work, a translation of Thunberg's treatise on the Upas of Macassar, with notes showing much knowledge of natural history. In April 1789 he joined his brother at Göttingen with a letter from Fischer to Pfaff, speaking of him as a fair proficient in political economy who might well have become distinguished in mathematics. This University was then at its height of intellectual power and glory. Alexander writes of his hearing Heyne in Greek, with Matthia, Krcis, and Woltmann for fellow-pupils, Spittler in trade and commerce, Lichtenberg in light, heat, and electricity, and Beckmann in agriculture. In moral philosophy Less was insufferably dull, Fromm of Frankfort seeming actually eloquent beside him. The English princes, Ernest of Cumberland and Adolphus Frederick of Sussex, who were students with Humboldt, moved his pity by having to listen to such dreary trash for a couple of hours a day, and to write out each lecture for Less's correction—"such is the folly actually demanded by that detestable English orthodoxy." He was himself bringing his widening erudition into effect in a little work (1793) upon the Greek and Roman loom, the parts of which he explained from archaic remains, the *onomasticon* of Pollux, the writings of Isidore and others, and which he showed to have been introduced into Spain by the Saracens in the reign of Charles Martel. Beyond all the professors of Göttingen, Blumenbach was the one who most attracted and influenced the mind and taste of Humboldt. His love of natural history, with his new and suggestive efforts to raise ethnology into a science, were traced through life by his grateful pupil as having been among the turning points in his career. It was to Blumenbach that the young student communicated with pride the result of his early experiments with galvanism upon the action of the muscles and nerves. In 1789 the Philosophical Society was set up, chiefly through the influence of Humboldt, among a number of students of like tastes and pursuits. Foremost amongst these, and most qualified by his manifold gifts and accomplishments to serve as a guiding star to Humboldt's career, was Heyne's son-in-law, George Förster, his senior by fifteen years, a linguist, a man of science, and a philosopher, who had already been Cook's companion in his second voyage round the world, of which he had published a masterly narrative. In company with Förster, Humboldt made in 1790 the tour of the Rhine, Holland, Belgium, England, and France. Of the observations of nature made in this journey one result was some slight and somewhat crude treatises on Basalt, to which his limited knowledge of geology led him to assign an aqueous origin, his authority on this point continuing to be appealed to long after he had himself renounced the mistake. Fragmentary notices from his journal and letters show him observant and busy in the Peak Cavern, Derbyshire, at Stratford, Blenheim, and Oxford; also in the thick of a general election, and in the House of Commons, where he mentioned late in life having heard Burke, Pitt, and Sheridan speak in one night. Nothing pleased him more in the course of this tour than the kindness and appreciation shown him by Sir Joseph Banks, to whom he repeatedly through life sent tokens of gratitude and recognition.

Humboldt's strong and growing tastes for nature and travel, fed from so many sources, were for a while diverted by his desire to qualify himself, in accordance with his mother's wishes, for practical or political life. While she lived all more cherished pursuits must give way to this. He is thus found at Hamburg at the end of July 1790, with a letter from Förster to Johannes von Müller, attracted by the celebrity of Büsch as a jurist and a lecturer upon political and commercial subjects. Still his leisure hours at the School of Commerce were occupied with geology and botany, to which he added the study of the Danish and Swedish languages. With the view of completing his education for public life, with especial reference to mining operations and the machinery employed in them, he next entered upon a six months' course at the School of Mines established at Freiberg in Saxony, in 1766, by Heinitz, and then presided over by Werner, reputed the first geologist of the day and even the founder of that science. Young Humboldt's aqueous theory of basalt naturally won him the favour of the arch-Neptunist, by whom Karl Freiesleben, a student of promise with whom he was destined to maintain a close friendship through life, was assigned as Humboldt's mining guide and college chum. The friendship and guidance of Von Buch must have been of even higher value. In eight months' time followed his official appointment as Inspector of Mines in Franconia, where he is seen indefatigable in duty, while storing up multifarious knowledge, setting up the first "fire-engine" at the Royal Porcelain Works at Berlin, where he worked hand in hand with Klaproth, reporting upon salt and vitriol works, narrowly escaping suffocation by carbonic acid gas in the alum works at Berneck, while experimenting upon a safety-lamp of his own invention. The versatility of his talents, brought to light in so many ways, led to his being despatched, much against the grain, on a diplomatic mission, in July 1796, to check the advance of the French under Moreau into the territory of the Prince of Hohenlohe. In the meanwhile an important turn had been given to Humboldt's mind and character by his joining his brother in the intellectual circles of Jena and Weimar, where the young German genius and the light of the new philosophy had gathered to a focus. From 1794, the date of his entry at that University, Goethe, who kept young poets ungraciously at a distance, but eagerly drew to his side youths who were engaged in natural philosophy, was irresistibly attracted towards Alexander von Humboldt, as Schiller's tastes for literature and romanticism drew him towards William. How deeply the gain to both natures from the reciprocal play of intellect and taste was felt on either side is to be seen from the terms in which each of the friends does homage to the genius of the other. Alexander's presence, Goethe writes to Schiller, April 26, 1797, "has had the effect of arousing from its winter sleep my taste for natural science," and he speaks of the "Dioscuri" who came to illuminate his path, setting at the head of those to whom he felt in debt for intellectual benefits received, Fichte, Schelling, Hegel, Schlegel, and the brothers Humboldt. In Goethe, on the other hand, Humboldt not only recognized the poetical interpreter, but the scientific expositor, of nature; and that none the less for the fact, which might be thought inexplicable but for the known self-absorption and exclusiveness of the poet, that Goethe, as it has been handed down, never discussed with Humboldt any of his own researches in botany or optics. How highly Goethe stood in his friend's estimation as a botanist is evident from the dedication to him of Humboldt's *Thoughts upon the Geographical Distribution of Plants*, a design of Thorwaldsen's for the title-page showing the genius of poetry as Apollo crowned with laurel unveiling Isis, at whose feet lies a book inscribed "The Metamorphosis of Plants." In *Cosmos*, too, he speaks of the great master of poetic art "whose works are deeply imbued with an equally intense love of nature." With Schiller there was obviously less sympathy or union. Of Humboldt Schiller speaks as "the impersonation of keen, cold reason, with no power of imagination, no tender sympathy, no sentimental interest." "He will never, notwithstanding his great talents and restless activity, accomplish anything truly great in science." "A trivial restless vanity is the main-spring of all his actions"—a harsh and erroneous judgment which, omitted in the published correspondence with Körner, is here given for the first time from the Schiller MS., together with the disparaging phrase "er ein Maul hat" (the gift of the gab). Schiller was nevertheless delighted with Humboldt's consenting to write, in 1794, for *Die Horen*, his new periodical, telling Körner that he is certainly the most gifted man in Germany in the department of natural science, "perhaps even excelling his brother in intellectual power, gifted as he undoubtedly is." It does not appear that Humboldt wrote anything for Schiller's paper beyond the ingenious and elegant little allegory, the *Rhodian Genius*, republished in the second edition of the *Aspects of Nature*, in which, by the mouth of Epicharmus, he sets forth his view of the vital principle in accordance with the philosophy most prominently enunciated by Stahl. Schiller's judgment of this charming fable was, in common with that of most critics of the time, far from favourable. It is most interesting as a sign of the philosophical bias of the writer at what may be considered the turning-point of his life, matured as he was by wide and thoughtful study for the direct investigation and pursuit of physical truth. In the new and instructive light thrown by the correspondence of this period upon the whole process of expansion and preparation in Humboldt's mind lies in fact, we repeat, the chief value and interest of Professor Bruhns's biography.

(To be continued.)

DIXON'S TWO QUEENS.*

THESE volumes are somewhat curious. They show us Mr. Dixon on his good behaviour. Mr. Dixon did not get his farthing damages for nothing. He is evidently trying to put together something which nobody can call either "obscene" or "vamped up." For once we are not called on to believe everything merely because Mr. Dixon tells us that it is so. He is beginning, if not exactly to give references, at least to tell us what are his authorities. One authority, to be sure, if we could only get at it with our own eyes, would doubtless outweigh all the rest in value. Many of Mr. Dixon's facts seem to be set down on the authority of "My Note-Book." The smallest belongings of great men have their charm, but we confess that a sight of Mr. Dixon's Note-Book would for us have a special charm. Perhaps we might find in it the first rough draught of those wonderful dialogues between the nun and the engineer which were worked up to such a brilliant stage of polish in the pages of *The Scotsman*. Perhaps we might find the jottings which Mr. Dixon made when he read the *Characteristics* written by an Earl of Shaftesbury under the belief that it was the first Earl of the series. Nay, what just now concerns us more, we might perhaps find in the Note-Book what we do not find in any part of this present

* *History of Two Queens.* 1. *Catherine of Aragon.* 2. *Anne Boleyn.* By William Hepworth Dixon. 2 vols. London: Hurst & Blackett. 1873.

volumes—namely, Mr. Dixon's reasons for believing that Mary, Duchess of Burgundy, wife of Maximilian, mother of Philip, grandmother of Charles the Fifth, was the daughter of Charles the Bold's last wife, the English Margaret. Mr. Dixon tells us so more than once; so it cannot be a slip. Genealogies, to be sure, are perhaps more commonly "vamped up" than anything else; but we have too great a love for our farthings to run the risk of hinting that Mr. Dixon has "vamped up" this or anything else. He must have some reason, if he would only tell us what it is, for thinking that all earlier historians of that age have so sadly mistaken the Duchess's parentage. He must have some way of explaining how it was that no advantage was taken of a descent which would have put Philip and Charles so near in succession to the English Crown. It would, one would have thought, have been very little use for Henry and Ferdinand to take off the head of the Earl of Warwick, if male descendants of Margaret, male descendants of Richard of York, were not only living, but were among the most powerful princes in Europe. Mr. Dixon is certainly not disposed to undervalue the position either of Maximilian or of his grandson. Not only does Mr. Dixon, anxious perhaps to air his German, call Maximilian "Kaiser" long before other writers report him as being so much as "erwählter Kaiser," but both he and Charles in their turns are constantly called "heir of Germany," "heir of the Empire," somewhat to the prejudice, one might have thought, of the rights of the Seven Electors. Mr. Dixon's Note-Book no doubt contains some full explanation of these difficulties. But it is hard to be told so often that such a source of knowledge is in being, and yet to have no means given us of in any way profiting by its contents.

The Note-Book however which Mr. Dixon dangles in this tantalizing way before our eyes, but which he never allows us to grasp, is far from being the only source to which he refers us for the history of his two Queens. He sends us to all manner of books in all manner of languages. Who can say that these volumes are "vamped up" when at the end of each we find page after page of the names of books—English, French, German, Spanish—all of which we are bound to believe that Mr. Dixon has made use of? The list is imposing; still it is given us in a form which makes it less useful than it might have been. Yet we must not be hard upon a beginner. Mr. Dixon is quite a novice in the art of giving references at all. He and his public have so long agreed to dispense with anything which might imply a doubt as to the inherent infallibility of any statement of Mr. Dixon's, that they have not got into the ways of those authors and readers who are used to a more exacting standard. There are those who make it a point of conscience to give their readers means of testing every statement which they make without going beyond their own pages. We cannot expect Mr. Dixon to reach this stage all at once. It is something that he should recognize that there are such things as authorities at all. Still it is very seldom that we have the chance of comparing Mr. Dixon's own words with the words of the authority on which he relies. He divides his book into chapters, and his chapters into numbered paragraphs. At the end of each volume we may find the names of the books or manuscripts on whose authority the statements in that paragraph are founded. Doubtless this is something for the chosen few who have the books and manuscripts within reach, or whose zeal is strong enough to send them forth on a journey to consult them. But those whose libraries are rich enough in Spanish literature of all dates to be able at once to see how far Mr. Dixon's statements are borne out by his Spanish authorities must be a small and enviable class. Still we have no wish to discourage one who is plainly trying to learn to walk in better ways than he has hitherto been used to. Step by step Mr. Dixon may get on, till he gives us real references instead of, as now, a mere stately shadow of references. Twice or thrice, we are bound to say, he does give us documents in full both in Latin and in Spanish. So far, so good. But in many cases where there is no need to print a document in full, we wish to know, by looking to the bottom of the page, where Mr. Dixon got the materials for some of those striking and picturesque little touches of which his volumes are so full. But this hope is always baffled. We should like, for instance, to know, without rummaging through volume after volume, what authority Mr. Dixon has for calling the Mahometan sovereigns of Granada Caliphs, and their dominions the Caliphate. The formula is certainly unusual in European writers, but so many Mahometan princes in Spain and elsewhere have at one time or another given themselves out as Commanders of the Faithful, that it would be dangerous for any but a good Arabic scholar to pronounce dogmatically that no such title was ever used. This is just the sort of case for which references and foot-notes are meant. If we found such a formula in Mr. Prescott or Mr. Bergenroth, we should feel sure that they had some authority for it, though we should be better pleased if they told us what the authority was. With Mr. Dixon, even with Mr. Dixon on his good behaviour, it may be only a flower of rhetoric, meaning nothing in particular. The suspicion may very likely be an unjust one, but by the simple addition of a foot-note he might have hindered it from springing up in our minds.

If Mr. Dixon thus takes so much pains to keep clear of any charge of "vamping up," he has taken no less pains to keep clear of the other even graver charge which was valued, we presume, at the other of the two mites which made up Mr. Dixon's farthing. As far as we have read, and though we do not profess to have read every word—human nature will sometimes give way—we have read much the greater part of these two volumes, we have not come across anything which can lay Mr. Dixon open to a charge of "obscenity." In fact he would seem to have some wish to show us how near he can go to the forbidden ground and yet keep quite clear of it, how near he can go to the candle without singeing his wings, how he can handle pitch and not be defiled. He puts one in mind of those ancient saints whose virtue was so proof against all risks that they could safely put themselves in positions which in other men would have been looked at as quite proof enough of vice. The subject which Mr. Dixon has chosen is one which must have presented almost irresistible attractions to a writer whose line of life had lain a good deal in the way of Spiritual Wives and such like. King Harry's first two wives were not exactly spiritual, but they have got surrounded by an atmosphere almost as unsavoury as if they had been. If a man chooses really to go into the questions which pretty well make up the history of Katharine and Anne—and without going into them he cannot really understand the ruling controversies of the time—he will find himself in the very *cloaca maxima* of history. No doubt the private memoirs of Elagabalus or William Rufus would be nastier still, but we have not the same means for reconstructing them in full. It is not that people were more vicious then than at other times, but that even virtuous people were driven, either by their misfortune or their choice, to the minute discussion of such wonderful questions. There is a long Latin discourse of Archbishop Cranmer's in Mr. Pocock's collection of documents, an English version of which might perhaps come in some danger of Lord Campbell's Act. And these things cannot be shirked by any one who wishes to go honestly into the history of the time; our estimate of Henry the Eighth, and of many things and many people besides Henry the Eighth, must largely depend on the view which we take of the relations between Arthur and Katharine, and of the relations between Anne Boleyn and several people. It would be hard to write the history of these times in full, so as at once really to look questions in the face, and at the same time to write nothing which cannot with propriety be read aloud in a family. We know not what may be coming. Mr. Dixon calls his book *History of Two Queens*, but as yet we have only one Queen; Henry marries Katharine at the very end of the second volume. Or rather it is the History of Two Queens, but not the Two Queens in the title-page; for the book really amounts almost to a history both of Isabel of Castile and of Elizabeth of York. In writing about them Mr. Dixon does not lay himself open to any special temptations. It is when he gets—we suppose that more volumes are coming—to the divorces and trials of Katharine and Anne that his difficulties will really begin. As yet we get only a few guarded words, a few hints that no one looked on Katharine after her marriage with Arthur as merely a "nominal Princess of Wales." Here no doubt was temptation. We remember how much some writers have made out of the marriage, without waiting for the divorce. We remember how much Mr. Dixon himself made out of the unsavoury doings of the Court of James the First. It is plain that he has practised some self-restraint. He has at least put off the evil day.

Mr. Dixon, even in his reformed state, is not easy to review, or rather he is still harder to review in his reformed state than he was in the unreformed. When he wrote about the Switzers and Her Majesty's Tower it was no hard task to follow him; but no one can carry in his head all the details of the complicated European politics of the days of Ferdinand and Henry the Seventh. It is the sort of case where no one can follow in detail, unless he is prepared to go through as much research for the purpose of reviewing a book as he would have to go through for the purpose of writing it. Again, we must confess that Mr. Dixon's style stands in the way of that serious comparison of statement with statement which is the right thing with people who write straightforward prose in English or any other language. Mr. Dixon is the opposite to M. Jourdain; he stands to verse in the same relation in which M. Jourdain did to prose. Or we may liken him to the youthful Ovid:—

Et quid tentabam scribere versus erat.

In these volumes he has written a vast quantity of blank verse, and, as far as we can see, without knowing that he has been writing it, for he does his metre the injustice of printing it after the manner of prose. Certain it is that many lines together of the *History of Two Queens* fall, sometimes into the ordinary blank verse of tragedy or Milton, in other cases into something like the irregular metre of Southey. Sometimes indeed one can hardly think that the metrical form is unintentional. After Mr. Dixon has recorded the beheading of the Earl of Warwick, and added a quotation from Bacon which nobody can take for anything but well-balanced prose, he gives us a paragraph of one line which not only makes a well-metred verse of ten syllables, but is a kind of tragedy in itself:—

It was Fernando's axe that clove his neck.

But in other parts of Mr. Dixon's poem we have to dig the verses out from the hiding-place into which the printer has thrust them, as editors have often to do with quotations in both classical and mediæval writers. Here is a passage in the shorter iambic metre, one cultivated both by St. Ambrose and by Sir Walter Scott. Mr. Dixon follows the former by trusting to metre only, without adding the more modern invention of rhyme. The Queen spoken of is neither of the Queens in the title-page, but the mother of the former of them:—

The Queen was reeling in her mind.
So many graves about her feet,

So many ghosts about her bed,
So many troubles in her states,
Were more than mortal frame could bear.

Elsewhere, however, Mr. Dixon more commonly uses the familiar blank verse of tragedy. Here, for instance, is a graceful picture of Katharine when she first landed:—

Her name, her rosy cheek, her light-blue eye,
Reminded people of her English blood.

But lest people should be too bewitched with the foreign lady, it is well to put out a few pages later a protest against her father having any jurisdiction in this realm of England:—

On English soil Fernando had no voice,
Except so far as Henry might allow.

Here, again, we have a longer picture of Katharine, accompanied by the Earl of Surrey and Sir William Boleyn:—

The princess was beside herself with joy.
Yet near her mule, and near the Duke of York,
Stood two great courtiers, cap in hand, whose blood
Was by and by to mingle in the veins
Of one who was to be her rival in
The palace, her successor in the throne.

And so the thing goes on. We might copy whole pages by far the greater part of which falls easily into lines, very fair lines some of them, of ten-syllable verse. They are indeed broken here and there, sometimes by a few words with a syllable or two which refuse to bend with the run of the metre, but more commonly by lines, as we must call them, like the unfinished verses in Virgil or the short lines in the *Curse of Kehama*, which break in upon the rule of ten syllables, but which do not break in upon the iambic cadence. Let anybody take p. 351 of the first volume—the passage is too long for us to copy after copying so many—and he will find that the five or six opening sentences fall easily into iambics; not indeed like the others, after the manner of Milton, but quite after the manner of Southey. We do not know whether this metrical tendency is one of the beauties of Mr. Dixon's style in the eyes of his admirers; for our own part we like prose to be prose and verse to be verse. When we turn to pieces of really good narrative writing in other books, we find that it would be possible here and there to pick out a stray ten-syllable verse, but it is never possible to pick out four or five together as we can with Mr. Dixon. But the unlucky thing is that this poetical style of Mr. Dixon quite disables us from the sort of research which would be needed to test those of his facts which do not show themselves obviously on the surface. No amount of metre could persuade us that Duchess Mary of Burgundy was the granddaughter of Duke Richard of York. But when we find Lord Surrey and Sir William Boleyn described in easy flowing lines as standing on each side of the princess's mule, we really do not care to look in Hall or anywhere else to see if it really was so; we should as soon think of looking up the authorities for the judicial combat of Marmion and of De Wilton. Both our poets carry us off into a region which we are used to see peopled with historical names, but where we do not search too minutely into the historical character of their actions. But there is, on the other hand, a point of difference. Scott and Southey alike give us at the end of their volumes a mass of curious and miscellaneous matter which we have known some people of perverse taste prefer to the poems themselves. Mr. Dixon, when he comes down from his metrical flight, gives us nothing but dry references to books and MSS. which are hard to come at, and to his own Note-Book which is hardest to come at of all.

We cannot honestly say that we wish Mr. Dixon to go on any further with his *History of Two Queens*. We have no pleasure in hearing Arthur called over and over again, not Prince of Wales, but "Prince of Camelot." We see no wit or wisdom in repeating the words "moping widow" and "child of sin" over and over again in two or three pages. Some people, we suppose, like such tricks; we do not. Still, in consideration of Mr. Dixon's manifest strivings to behave better than before, we will promise him thus much. If he will write his next volume in prose—and we will define prose to be where we cannot find more than two ten-syllable lines, and those not consecutive, in each page—and if he will make his references even as little unsatisfactory as Mr. Froude's, we will review such a volume seriously as an historical work.

ETRUSCAN INSCRIPTIONS.*

LORD CRAWFORD has convinced himself that the language of the ancient Etruscans was a High-Dutch dialect, and that with this key we may decipher the strange inscriptions which have hitherto baffled philologists. We may say at once that his conviction and his interpretations, although many of these may lie open to serious objections, cannot be dismissed with contempt. The last hundred years have been marked by many marvellous philological discoveries, of which some have stood the test of criticism, while others have gone their way into the limbo of absurdities. The monuments of Darius and Tiglathpileser have been read with a success, and a general harmony among interpreters, which leave no doubt of the soundness of the result; and the fact that Egyptian hieroglyphics have been made to yield up their secrets is no longer questioned even by those who hold that these hieroglyphics furnish very little history and no definite chronology. But, whether in the case of the Persian or of the Assyrian and Egyptian inscriptions, the method followed has been the same. This method is hedged in by the rules which an examination of the growth of language has imposed on comparative philologists; and discoveries which have been brought about in defiance of this method have been met by strong suspicion or dismissed as absurd. The results of Assyrian explorations have been received with confidence, not only because the inscriptions have been shown to be written in a coherent language whose grammatical structure has been thoroughly analysed and compared with that of other kindred dialects, but because they yield intelligible statements, many of which are abundantly borne out by writers belonging to other countries, and not a few of which furnish precisely those contradictions to the versions of foreign writers which we should expect to find in them. When, therefore, an attempt was made to prove that the inscriptions of Sennacherib and his fathers were pure Arabic, and that they resolved themselves into incoherent ravings and howling incantations to the sun, the moon, and other gods—and this too only by dint of leaving a good deal of matter untranslated—the effort simply raised a smile, and it was felt that Sir Cornewall Lewis's reading of "Hey Diddle-diddle, the Cat and the Fiddle" into old Umbrian was a better and a more successful joke. In his hands the old English nursery rhyme became an excellent votive inscription; the deliberate absurdity of the thing lying only in the arbitrary assumption that the Umbrian might be read off into English, or English into Umbrian. If solid grounds could be adduced for believing that the method here followed was not arbitrary—in other words, that the translator went upon no mere assumption—the process and its results would both cease to be absurd. But we have had so much of random guesswork of the wildest kind that a feeling of impatience on being brought face to face with fresh wonders may well be forgiven. The burnt child dreads the fire; and we may shrink from experiments which give the Phrygian *dav* or *dam* as the mother of our *dame*, and which find in the Assyrian Nergal a compound of the Greek *anêr* and the Hamitic *gula*. The mischief of this lawless license is not confined to the jumbling of words from languages no more akin to each other than English and Tahitian; and the authors of these random guesses are responsible for the historical and theological speculations which their unwary victims have based upon them.

Lord Crawford is not to be classed with men of this school. However defective may be his method, and however uncertain his results in some or in many cases, however sure we may feel that not a few of his interpretations must be rejected as groundless, he is aware that the attempt to decipher writings in any language is absurd unless we have good reasons for believing that we can trace the affinity of that language to some other known dialect. If, then, he starts with the assumption that the old Etruscan was a High-German dialect, he has at the least shown that this assumption is not arbitrary. No one probably now looks on the old fancy that the Tyrrhenians came from Lydia as worth a thought, and no one probably is less confident in the likelihood, at least, of Niebuhr's conclusions respecting their origin. In the facts that the Rætian speech was closely cognate with the Etruscan, and that the Etruscan cantons had, in earlier times than that in which we become historically acquainted with them, extended to the north of the Po, and even into the mountains, we have a full justification for tracing their course from the North and not from the South. This conclusion Niebuhr adopted without hesitation; nor have the speculations of philologists, even when they differ most widely from each other, advanced anything to shake it. That the old Etruscan language belonged to the class of Indo-European dialects has been admitted by all. In Dr. Prichard's belief nothing more could be regarded as "tolerably well established." Dr. Donaldson held it to be "in part a Pelasgian idiom, more or less corrupted and deformed by contact with the Umbrian, and in part a relic of the oldest Low-German or Scandinavian dialects." Differing from him in seeking a clue through the labyrinth in High rather than in Low German forms, Lord Crawford does not stand alone; and all that remains to be done is to test the soundness and value of his results. Of their general correctness he feels no doubt; indeed doubt would have been a conclusive reason for not putting them forth to the world. But while he is prepared for the rejection of much, he thinks that from the amount of work already done "some views may be formed as to the course which inquiry will take in these directions." He admits candidly at starting that to some extent the search must be empirical. The Etruscan bilingual inscriptions have yielded no Rosetta stone in which the two texts give the exact equivalent in the two languages. With one solitary exception, "the whole of them put together only furnish one single positive Latin equivalent for an Etruscan word other than a proper name." But if Lord Crawford's speculations may at all be trusted, the method by which proper names were translated gives some results confirming his theory. One of these inscriptions exhibits the Latin Q. Folnius Pom Fascus as the equivalent of the Etruscan Ælchephalmiælches Kiarthialisa, the latter word being a metronymic, not a patronymic. Here the prænomen Quinctus answers to the Etruscan Ælche, while for the cognomen Pom., whatever this may be, the Etruscan has no corresponding word. Lord Crawford, holding that Quinctius or Quinctus may be compared with Fabius, Lentulus, and many other Roman names taken from fruits or vegetables, looks for

* *Etruscan Inscriptions Analysed, Translated, and Commented upon.* By Alex. Earl of Crawford and Balcarres, Lord Lindsay, &c. London: John Murray. 1873.

analogies to Ælcho in Teutonic dialects, and finds it in the German *quette* or quince. The rest we must give in his own words:—

"Quett-isch would be "of or belonging to a quince." *T* and *l* are interchangeable letters; and thus *quet-* would become *quel-*, and *quettisch quellisch*. But there is a constant tendency in Teutonic words which begin with *q* to drop that letter, as, *e.g.* in *quus*, which we have already shown to be the old form of *feast*, and in *quell*, "fons," the English *well*. Our original *Quettisch* thus becomes *Uellisch*, that is, in Etruscan *Æt-cii*, or more properly *Æt-scii-*, the Etruscan ∀ having, I have suggested and I think shown, the force of *sch*. On the other hand, the genius of the Latin dialect was less ready to part with the initial *q*, as we see in the retention of "quatuor," "quinque," "quis," as compared with the Celto-Gallic and Teutonic pater, "four," the Greek and Italic *πέντε*, "five," and innumerable similar words; and thus Quinctius survives; or, in other words, Quinctius is simply the original *quette*, *quents*, with the *n* inserted for euphony (p. 69).

We will but note here the seeming haste of Lord Crawford to put down as directly Teutonic words which may have been received through Latin from the common source both of Latin and Teutonic. Feast and festival have an ecclesiastical look; and a more obvious analogy for *quas* might be found in the old English waes-hail or wassail. The mysterious Pom. in this inscription Lord Crawford, without pretending to determine its developed form, refers to the Pomum Cydonium, Κυδωνία, or quince. That *Kiarthialisa* answers to the cognomen Fuscus there can be little doubt. Lord Crawford, asserting that TH is a softened form of z, finds the Teutonic equivalent of Kiarthi in *Swarz, Swarz, Swart, swarthy*. In another inscription the Latin Niger translates the Etruscan Thapirnal; and here again the TH, as equivalent to z, leads Lord Crawford to connect the word with the German *zauber* and the Greek *σφήρος*. In the same way the Latin *violens* is written on an inscription at Perugia as the equivalent of the Etruscan *Kahatial*, in which Lord Crawford discerns the modern German *heftig*, the older *haftig*, derived from the same root as the Etruscan *capys*, γύψ, a hawk, and *haben*, "cap-ere," to seize. He is not even deterred by the mysterious phrase *κόγξ ὀμπαξ*, by which the worshippers were dismissed at the Eleusinian mysteries, and which some have identified with the not more intelligible form Cansha om Pachsa, with which the Brahmins close their religious services. For Lord Crawford these words have no mystery at all, and represent simply *Gang zu ambachs* or *zumbachs*, "Go to your (practical) duties," "Go about your business." On such ground as this there is need of wary walking, and we move among pitfalls as we follow his remarks on the correspondence between the Latin names Caius and Caia and the Etruscan Vele. That Caius and Caia came to denote man and wife is proved by the words used by the Roman wife on crossing her husband's threshold for the first time—*Ubi tu Caius, ego Caia*. So completely had the origin of this phrase been forgotten that Cicero looked upon the choice of the name as a mere accident, like that which introduced John Doe and Richard Roe into English law courts. Some woman named Caia was the first, or among the first, who had been married by coemptio; and her name being found in old records by later writers led them to suppose that all women married by coemptio were called Caia or Gaia. Lord Crawford thinks that there must be something more in it when we trace the name through Umbrian, Volscian, and Oscan, as well as Latin dialects, and when we find that Gaia in Greek is the earth as the universal mother, Caius and Caia being thus the active and passive agents in reproduction, and thus rendering it not unlikely that the Etruscan *vele* is cognate with the Teutonic *bull*. But it would be satisfactory to have some decent warrant for going off to the "old Egyptian Ka-, signifying 'husband, male,'" or to the Semitic Baal for Vele. Here, as for *quas* and *wassail*, we have a nearer source in the root which has furnished the large family of words, including genus, kind, kin, king, and queen.

As a last instance we may take the process by which the name Otacilius, as translating the Etruscan Unata, is connected with the Greek and the Teutonic wind gods. In Unata Lord Crawford sees another form of the Etruscan Andas, interpreted Boreas by Hesychius, of Antæ, which Hesychius assigns as the Etruscan for "winds," as well as of Antar, which he interprets by ἀετός, the eagle. In the first two words Lord Crawford sees an abraded form of *went, ant, and, wint*, wind, the Latin ventus, the first syllable in Otacilius representing the same word, while *-acil* points to the Latin aquila, the vogel, fowl or bird *per excellentiam*, and to Aquilo; which at once brings Lord Crawford to Boreas, and plunges him into venturesome speculations on the mythology of the Edda, in which the giant Hræs-velgr is spoken of as living far in the North, the wind being produced by the shaking of his eagle wings. Hræs-velgr, he thinks—but he does not commit himself to the assertion—may be a Scandinavian form of Boreas-fylg, and thus equivalent to Boreas, the messenger, and he is of opinion that Ὠτ- ακλ- may be ultimately resolvable into this compound name:—

This inference [he urges] is palpably supported by the facts that, by an ancient tradition, the Otacilii derived their origin from Dacia, that is, Thrace—that Boreas lived, according to mythological legend, in Thrace, and that "Hræs" in Hræs-velgr is etymologically the same as Thrax and Thrace on the one hand, and Boreas on the other—the Getæ, moreover, being proto-Goths or Jötuns—the Juthungi being evidently one of their divisions—of the precise breed of Hræs-velgr.

We have allowed Lord Crawford to speak for himself, and although our judgment generally must be reserved, he has at least a claim to a fair hearing. Language, he admits, has not been his special study, and his object has been not to interpret these inscriptions for their own sake, but to ascertain what the language is in which they are written, and to apply the argument thence arising to the solution of the question "Who were the Etruscans?" Possibly, at a time when we have the promise of a work on the subject by one who has made language his special study, Lord Crawford might have done more wisely in keeping back his own volume. But, as he has put it before the world, it would be unjust to withhold our opinion that his toil has not been altogether wasted, and that he has done good service by his attempts to break ground in a field on which more labour must be spent hereafter.

SQUIRE SILCHESTER'S WHIM.*

ONE of the characters in Mr. Disraeli's latest novel attributes the vigour of the English upper classes to their abstinence from books, combined with their out-of-door habits of life. Mr. Mortimer Collins, or at least Mr. Collins's Squire Silchester, pushes the theory a stop further, and argues that, while it is certainly well to read very little, perfect safety lies only in not knowing how to read or write at all. The Squire brings up his son and daughter on this principle. When the girl was twenty and the boy nineteen they had never opened a book. Their father undertook their education, and told them in rhyme everything he thought it necessary they should know. The result, we are assured, was that they possessed a great deal more of all the best kinds of knowledge than most young people of their age, and especially they knew how to commune with Nature (capital N of course). These studies, it seems, frequently led Silvia to the tops of the highest oaks in her father's woods. The first part of the story is full of denunciations of the alphabet and that "scoundrel Cadmus," and all the mischief and misery that come from reading and writing; and we naturally expect that the succeeding chapters will show the admirable results of the Squire's plan. We are surprised and disappointed to find that when the young Silchesters grow up they are very like other people, except that they talk rather more nonsense and are distressingly priggish. Silvia has spent her youth on the tops of the oaks, as far as we can see, to very little purpose, and she gives up her taste for climbing as her petticoats lengthen. As for Silvester, he turns out not only a prig, but a poetaster, a writer of verses of the genuine *Keepsake* and *Book of Beauty* style, and of these Mr. Collins inflicts on the reader rather too many examples. "What perplexed our young poet at first was absolute ignorance of the art of writing"; but this was an obstacle which a sharp memory enabled him to overcome, and afterwards he learned writing on his own account. If Mr. Collins had depicted the weak-minded youngster as having been saved from the misfortune of proclaiming his imbecility in wishy-washy verses, he would have furnished at least one good argument in favour of striking out reading and writing from the ordinary course of elementary education. Possibly if Silvester had been taught his letters in the ordinary way as a child, he would have worked off his yeasty sentiment at school. It is said that a novelist's creations occasionally exercise a strange fascination over his own mind, and one is led to suspect something of this kind here. It would almost seem as if Silvester had seized Mr. Collins's pen and written the book for him; there is a tone of boyish greenness and pretentious, inflated sentiment, big talk, and small ideas running through it all. When we say boyish, we mean something of course very different from the fresh boyishness of the genuine schoolboy—which in its way is quite natural, and, we may even say, manly; we mean rather the boyishness of settled unripeness and hopeless immaturity; the boyishness of the man who has grown in years, but not in manhood. Both Silvester and the author break out into rhyme on the slightest provocation, or rather on no provocation at all, and their verses are wonderfully alike in glib mechanical dexterity, and borrowed or reflected commonplace. The verses which are used to swell the volume have for the most part absolutely nothing to do with the story; but, after all, verses which are printed as verses carry their warning with them, and a very little taste of Silvester's puts us on our guard against them. But it is hardly fair to entrap the unwary reader by verses disguised as prose, as in the following passage—a young lady's soliloquy:—

Oh, if I only knew how to tell whether a man was true—how to tell whether his brilliant bravery had any kin at all with knavery—how to find his measure of mind beneath the handsome corporeal rind! I am ready to love to my uttermost breath, and to give my love to the verge of death. But he whom I love must be true, or I shall leave him alone in his filth—and die. Better any death than to bear the curse of a scoundrel husband. It were not worse to be a slave without chance of egress—a frightfully flogged and scarified negress.

With more of the same stuff to match. In order to eke out the three volumes we have not only scraps of namby-pamby verse, but old legends, dull dissertations on the elements of poetry, on the relations between the sexes, on the best form of government, drainage, the poor-laws, and even—of all things in the world—"a digression as to diplomacy with America."

The story, as far as there is any story, would fill, we should say, pretty nearly one of the three volumes into which the work has been painfully—we are thinking of the reader—spun. If Mr. Collins had put what there is of it into a single volume, there would have been less reason to complain, but it is rather hard

* *Squire Silchester's Whim.* By Mortimer Collins. London: King & Co. 1873.

that people should be deluded into wading through all this flabby leading-article and still more flabby verse under the pretence that it is part of a story. Mr. Collins should take a hint from the honest milkman, and give his milk and his water in separate jugs. Of the story itself we cannot presume to say anything in the way of criticism. It is just one of those things which defy, or at least elude, criticism. We must content ourselves with trying to give a faint idea of it. The Silchesters are a very old family, and Devonshire to the backbone. Silvester's grandfather, disappointed in love, waited till the sweetheart who threw him over had a daughter marriageable, and then married the daughter. Silvester's father saw a young lady one night at the theatre, proposed to her next day, and was accepted. Silvester himself went out one day for a walk. In a lane he met a young lady, Miss Louisa Osyth St. Osyth, the rector's niece. He had never seen her before; but she looked a very nice girl, and so he said (quite in the good old Devonshire way):—

Silvester.—"Marry me?"
Louisa.—"To-day?"
Silvester.—"Not necessarily; but when a girl has said yes, she is married. You are my wife from this moment, Louisa, if you say yes."
Louisa.—"I say yes, my dear love . . . and I am yours always."

And presently Silvester goes off into a gabble of verses, quite in the style of *bonbon* mottoes.

Miss St. Osyth is described as "very High Church and very learned." She was a first-rate geometrician and algebraist, read Greek and wrote Latin, and composed her uncle's sermons for him. Silvia, Silvester's sister, was "a sumptuous young creature with fair hair, dog-violet eyes, straight Greek nose, and much magnificence of curve." One day there arrives at the Devonshire village by the sea a little undecked boat with a lateen sail. A stalwart young fellow, with bronzed face, jet black hair, and a pair of pistols and sharp long stiletto without a sheath in his belt, steps on shore. On board the boat, and chained to it, is a panther, which keeps guard over a chest of gold and jewels, the stranger's travelling treasury. From a pouch in his belt he produces a rough diamond, about the size of a hen's egg, and a nugget of gold that might weigh a dozen pounds. His pockets are full, as he incidentally observes, of precious stones, in case he should run short of change. This interesting young man falls in love with the two girls and resolves to carry them off, either one after the other or both at once. "He thought of islands in the Greek seas that he remembered, where it would be Elysium to live with a woman till you tired of her. What then? Leave her to chance or sell her as a slave." Thus the nice young man meditated over a pipe of honeydew. He seizes Louisa first, puts her in his skiff and makes for an island, which he has hired for his purposes, at a short distance from the coast. She escapes, with the aid of an old Highlander. Next, he disguises himself as a missionary, lives in a secluded tower, and makes a haul of both girls, who have fallen into a pool close by and have come to the tower to get themselves dried. He puts Louisa into one of the cellars and chains her to a staple in the wall, and meanwhile Silvia walks home in her sleep—only a mile or two—clothed simply in a blanket. An alarm is raised, and Louisa is again rescued. Another time Nugent—for that is the villain's name—reappears dressed as an old gipsy, is again foiled, goes away to Jersey, and hires a man with a balloon to fly away with one of the girls. But the balloon is destroyed in a storm, and Nugent can now think of nothing else than putting himself at the head of a band of navvies who have been sent down to survey the Silchester country with a view to a new railway, and besieging the Squire's house by night. At last he is caught and locked up in a lunatic asylum for the rest of his days. We feel, however, that we have given a very feeble idea of the complicated villany and startling incident of this thrilling romance, which is certainly quite equal, if the poetry, philosophy and other jargon were left out, to anything we ever recollect having read in penny numbers when a boy.

In epigram Mr. Collins is almost as strong as in incident. Here are some samples:—"Trees talk." "There are cats and dogs among men and women." "Curiosity, like Comedy, lives in villages." "The pulex is not named in genteel society." "The perfect lady is the difficulty of description." "The sort of woman whom it is my desire to describe is confoundedly indescribable. Pretty? Perhaps. Witty? Rather. Dreamy? Drat it. Sweetheartish? Yes, thank you." We learn incidentally that as a rule the author is to be found in bed between 2 A.M. and 8 A.M., though sometimes in cold weather he takes another hour or two in the morning, and that "when he hears a man swear at a servant, his reflection is—'You won't dine with me.'" One of these days, should the Good Templars and Permissive Prohibitory people get the upper hand, these volumes will possess a curious historical value, as a record of the obsolete drinking customs of the country, or at least of Devonshire. The book reads like a continued carouse, and may be described as a romance of chronic alcoholism. Nothing ever happens without a drink. There seem to be always glasses on the table, and corks popping, and a strong odour of liquor and tobacco-smoke. Every incident has its appropriate beverage, and at intervals business is completely suspended for a big drink all round. There is a doctor in the book who insists that "brandy should always be carried in the pocket." When the rector is in trouble about his niece he is "dosed with brandy" and goes home consoled. When Louisa is on the villain's island she has a lobster and pint of still hock for luncheon, and afterwards Donald cplies her with Glenlivat. "We might manage some Moselle cup," says gentle Silvia, in one of her thirsty moods; and when she and Louisa seek shelter at the tower, she remarks that they are lucky to find a fire and "something to drink." "Getting opposite to each other in front of the fire, clad extemporaneously in blankets, with a table before them, on which was a bottle of cognac, and a kettle singing on the fire, they are certainly not to be pitied." The Squire, we are told, drank brandy and seltzer with his pipe in the library, and occasionally Tokay or Madeira when he had an old friend with him. On market-days he had a glass of sherry at the "Silchester Arms." When some old manuscripts are going to be read, "cool liquids" are ordered up. The villain's favourite drink is cider and brandy, half-and-half, but when disguised as a missionary he has "a pretty little straw-coloured pints of maraschino about him." At a school-girls' party the author lets off the young creatures with a taste of "a weak preparation of alcohol." In the second volume there is an arid interval in which nobody is drinking anything, and Mr. Collins has to look up a couple of school-boys and a drunken voter and send them together to a pot-house. The boys and the voter have nothing on earth to do with the story, and nothing comes of the incident; but it is at least a pretext for a dram. Towards the end of the book there are strong symptoms of dipsomania. Even the ascetic vicar acquires a keen appreciation of Chablis with lobster salad, gets quite chirrupy, and spouts Catullus. The company have a hearty meal at 10 P.M.; then they go out on a moonlight adventure, make a call, and have another "good supper of lobster and rabbit," and then "home to breakfast." Another night they polish off "a quantity of cold beef, and—fortunate find!—a lobster and a mighty tankard of old ale, singularly soft and strangely potent." But as they do not go to bed immediately, they are soon ready for "a splendid piece of bacon and no end of eggs," with another "mighty draught of ale." There are some passages about wedding ceremonies at the end that might certainly have been written by Silvester during or after one of these heavy nights.

SYMONDS'S RECORDS OF THE ROCKS.*

MR. SYMONDS, an early promoter of the field-clubs which are now so popular in many parts of England, endeavours in his *Records of the Rocks* to interest his readers rather by pleasant gossip than by authoritative teaching. Indeed it is rather in his general character as a pedestrian guide to "amateurs who," to quote the words of his preface, "enjoy passing their leisure hours among rocks, old castles, old authors, and the wild flowers of strange wayside places," that we prefer to regard Mr. Symonds in the present notice of his book; for we are sure that, while it will serve as a very useful itinerary for geologists on their rambles, it will be still more welcome to the more discursive naturalist and to the ordinary tourist, on account of the variety of fields over which it conducts him. Leaving, therefore, to others the phenomena of denudation upon which he discourses in the Woolhope Valley and elsewhere, the relative influence on highland and mountain scenery of aqueous action and volcanic movements, and the problems connected with glacial erosion which are recurred to in several parts of the volume before us, we shall content ourselves with taking account of the collateral objects of interest which environ Mr. Symonds's path. Whoever avails himself of the *Records of the Rocks* as a travelling companion will be in no danger of wasting precious time by the way, in false starts or mistaken routes. The writer is thoroughly acquainted with his ground, and spares no pains to give his readers clear and useful information on all sorts of subjects. Suppose, for example, we are seized with a desire to ascend the Lickey, a remarkable range of hills to the north of the town of Bromsgrove, the Longmynd in Shropshire, or that landmark of the Herefordshire border of Gloucestershire known to every traveller as May Hill—Mr. Symonds tells us not only the most convenient route, but all that it is desirable to glance at by the way. Here is a description of May Hill, which will afford a fair illustration of Mr. Symonds's style, and may perhaps recommend the ascent to tourists who might otherwise be disposed to tarry at its base:—

> May Hill, which gives its name to these Upper Llandovery rocks, is a great prolongation of the axis of Silurian strata from Woolhope to Purton and Tortworth, across the Severn into Gloucestershire. It is supposed by some to take its name from Maia, the mother of Mercury, whom we now behold in the heavens as one of the Pleiades, while the less antiquarian mind attributes the name to the fact that, on May-day in times gone by, the good folk of Gloucester danced on the green among and around the firs that are planted on its summit. Nowhere in this part of England is there a nobler view. To the north rise the ancient Malverns, the Silurian rocks of Ledbury and Woolhope clothed with wood, and to the north-westward peep out in the distance the Welsh hills of Old Red Sandstone, with here and there an outlier of Carboniferous rocks, telling the history of denudation between points so distant as the Pen Cerrig Calch, near Crickhowell, and the Clee Hills in Shropshire. Westward is the Forest of Dean, with its Old Red base, and all the Carboniferous series on its summit; and eastward is the Severn, wandering by the old Norman cities of Worcester, Tewkesbury, and Gloucester, among the battle-fields of centuries, by ancient cathedrals, abbeys, and churches, until it expands into its fine estuary; and far away to the south we see its glistening waters bordered by the Cotteswold, the Mendip, and the Quantock Hills.

This is a very good example of the sort of mixture of geology, archæology, and local geography which Mr. Symonds provides for his readers, and they can choose for themselves whichever aspect

* *Records of the Rocks; or, Notes on the Geology, Natural History, and Antiquities of North and South Wales, Devon, and Cornwall.* By the Rev. W. S. Symonds, Rector of Pendock. With numerous Illustrations. London: John Murray. 1872.

of the landscape they may happen to prefer. When we are carried on a visit to the beautiful and secluded Abbey of Llanthony, Giraldus Cambrensis is laid under contribution for its origin and history, and the gossiping old Archdeacon of Brecon is cited as affirming that the stones of the Black Mountain of which the structure was built are "Parian stones," susceptible of a high polish—in other words, free stone "qui et liberi vulgo dicuntur." At New Radnor, Leland is quoted in reference to a ruin supposed to have crowned the summit of the Castle Hill, but without a vestige or token left, till an attempt was made in 1863 to dig foundations there for the "Lewis memorial." These excavations unbared, it would seem, the very "piece of a gate" which Leland says "was amendyd." Certainly not until Mr. Symonds unearthed the fact would modern Radnorians have dreamed what the same topographer records, "that after Owen Glyndour won the castel, he took a threescore men that had the guarde of the castel, and caused them to be beheaded on the brinke of the castel yard, and that, since, a certain bloodeworth groweth ther wher the bloode was shed." It was on the historic ground of Whittington Castle, near Oswestry, which Guarino de Metz won with Peveril's daughter as the meed of prowess in the tilt-yard of the Castle of the Peak, that it first occurred to Mr. Symonds to combine his geological investigation of rocks with some account of the buildings, ecclesiastical or military, which have been built of or on them. This combination of historical with geological lore is sometimes turned to good account. Notably is this the case as concerns the bearing of botany on geology; and, in a kindred fashion, geology explains archæology and legend lore, or *vice versâ*. Near Merlin's city, Caermarthen, the wizard, so legends tell, was enticed on a fine summer's day, when the birds were singing and the butterflies flitting, by another wily fairy Vivien, into a cavern, where she entombed him by aid of his own spells. The clue to the whole story is, it seems, the appearance of buttertlies (or trilobites tails) in the "Upper Llandeilo" rocks of Pensaru and Mount Pleasant.

It was at the legend-haunted Llandewi Brevi, near Tregaron in Cardiganshire, that St. David's preaching to the bishops, abbots, clergy, and laity of Wales was so visibly and supernaturally sanctioned "that a snow white dove descending from heaven, sat upon his shoulders; moreover, the earth on which he stood raised itself under him till it became a hill," on which indeed its still remaining church was afterwards built. The legend, Mr. Symonds surmises, is referable, in part at least, to the fact that the site is a volcanic dyke of the Caradoc period; whilst the fable of the furrow of the Llanog oxen, which in St. David's day transported the carcase of a gigantic beaver from the same place, and of one of which the horn was a holy relic implicitly believed in by the Cambro-Briton, is clearly due to the preservation there of a well-fossilized portion of the horn of "Bos primigenius." The marvel of Marcley Hill, near the conflux of the Lugg and Wye, in Herefordshire, changing its ancient site, and going of its own volition a slow and painful three days' march to a higher station (A.D. 1575), is still referred by the gaping rustic to an earthquake at the Crucifixion. The undoubted solution is a landslip, not singular in the Upper Ludlow rocks about the Woolhope country. "The cause of these great landslips may be referred to the jointed structure of the rocks, the steepness of the dip of the beds, and the percolation of much rain down the joints." The Buckstone, near Monmouth, which is usually called Druidic, is shown to be one of many cases of erratic boulders; and the legend in North Wales "that from Llandudno to Puffin Island was dry land within the human epoch," has its germ of truth in the geological doctrine of submergence. These instances, it is true, are rather connected with legend than with history, but there is no old castle of which Mr. Symonds does not tell us the personal history as well as of the rock out of which it is raised; and the care with which he has ransacked Giraldus and Leland and Camden bespeaks him an observer of catholic instincts, and not a *homo unius libri*.

Mr. Symonds has also a quick eye for objects of botanical interest, as will be seen from the care with which he chronicles the finding of the exceedingly rare Draba Aizoides at Pennard Castle, near Gower Inn, in Glamorganshire, and the Yellow Wood Anemone growing wild in the same neighbourhood; the Tree Mallow and the Arabis stricta in the scarce accessible clefts of the Stack Rocks, in Pembrokeshire, and the rare and curious flora of the Doward and Symonds Yat on the opposite banks of the Wye. The mention of the Arabis stricta and the Tree Mallow reminds us of a stirring personal anecdote of the author's, in reference to the perils incident to the pursuit of science by an ardent botanist or ornithologist, or to the indulgence of the irresistible pastime of stone-throwing by the sight-seer endowed with an average amount of life and spirits:—

> There is a danger [writes Mr. Symonds in reference to egg-gathering at the Stacks] which may as well be mentioned, as I had a narrow escape myself. Lord Cawdor has fortunately forbidden shooting at or disturbing by fire-arms the swarms of sea-fowl which frequent the coast rocks, or no doubt what has occurred at Puffin Island, near Beaumaris, would occur here, and the birds would be persecuted, mangled, and destroyed. Still it is hardly possible to see flocks of guillemots and puffins, which cover the Stacks, apparently within a stone's throw, without jerking a pebble in hopes of persuading the multitudes, which are there sitting and screaming, to rise and fly. I had made one or two attempts at a long and strong throw, when my feet slipped, and I had a heavy fall on the slippery glass with my feet over the precipice. Only a week afterwards a number of schoolboys went from Pembroke to the coast for a holiday, and one of them, in throwing a stone, lost his footing, shot over the rock, and was dashed to pieces.

Mr. Symonds is so lively a writer and so pleasant a fellow-traveller, on paper or afoot, that we hope he will take a lesson, and steel himself against the boyish penchant for shying stones, especially in such perilous places, as well as against emulation of adventurous egg-collectors, such as the one who

> sprang across a chasm which would have puzzled an Anne of Geierstein, and returned in a few moments with a handful of lovely rose-coloured blossoms (of the Lavatera), all the more valuable as being gathered in a truly wild locality.

An excellent idea of such habitats of a wild flora may be gathered from the frontispiece and the illustration facing p. 342.

The botanical contrast between the wild plants of Conway and Llandudno, and the favour shown to diverse vegetation by limestone rock and trap rock respectively, is well worked out in p. 311; and we are introduced to the haunts of the Maiden Pink at Diganwy, and of the Pyrenæan "Cotoneaster vulgaris" on the Great Orme's Head. Indeed in all Mr. Symonds's geological rambles, no botanic specimen passes unnoticed. When he marks the reindeer lichen side by side with the Ling in Wyre Forest, in Worcestershire, he is rapt into the past, and chants a pæan over the relics of an alpine and sub-alpine flora, where thousands of years ago wandered the reindeer and the mammoth (386). This is part of the romance, so to speak, of geology, akin to the accounts of the bone-caves, the submerged forests, above all to the lignite formations of the vastly remote Miocene period, of which, in connexion with the discoveries of numberless sub-tropical plants and shrubs fossilized at Bovey Tracy in Devonshire, our author has an excellent summary in pp. 286-90. Nor is ichthyology neglected. Mr. Symonds has an interest, as a disciple of Isaac Walton, in other fish besides palæozoic, and reverences a certain St. Cyric, connected with Radnorshire, as much for his traditional introduction of very fine trout into the little glacial lake of the Drygan mountain, which consists of Lower Landovery rock, as for the cure which resided in his staff for glandular swellings. This saint, by the way, would have been warranted to know a samlet when he took it. Mr. Symonds also has something to say about the peculiarly white-scaled trout of the Bala Lake, called the "Gwyniad" on account of its colour from the days of Camden. Sir William Jardine regards it as an allied species of the genus Coregonus. A tourist who has been fortunate enough to put this book in his portmanteau when exploring the districts of which it treats will certainly be at no loss for interesting and valuable local information of every kind.

HUGHES'S MEMOIR OF A BROTHER.*

WE think it fortunate that this Memoir was not "meant originally for publication," but was written solely for the sons and nephews of "the home-loving country gentleman" whose life is here briefly given us. It is happy that it is not in that "very different form" which Mr. Thomas Hughes tells us "it would have taken" had he from the beginning had his thoughts fixed on the public. There are in every generation a few men whose lives are matter of great public interest. There are still more who, though they have not lived in the full blaze of public life, have yet been so far out of the common run that it would not be an idle curiosity which should lead us to ask to be admitted into a knowledge of their histories. There are, besides these, men who may be counted, not by the tens or by the hundreds, but by the thousands and tens of thousands, who in their own homes, their own villages, their own worlds—that small circle of four English miles diameter or thereabouts, as Tristram Shandy defines it—have led lives so good and true that each little knot of mourners would fain know more of the history of one who in their thoughts held so large a place. The lives of such men are always worth reading, though it rarely happens that there is any one capable of writing them. If indeed a biographer does arise, he almost always falls into the error of treating his hero as the frog in the fable treated herself. He swells out his homely virtues till they become offensive by their extravagance, and, while demanding that we shall see in the man whose life he writes a miraculous draught of all the great qualities that are to be found in the boundless main of human nature, he forgets that he forces us to ask how it happens that a man so great has done so little. If a man's goodness and greatness were known only to his own home, let their story be written for his own home. If they took in a wider range, and filled with love and admiration a village or a township, let their story be written for the village and the township. If, again, a man's good life, though known to few, yet ranged beyond his little local world, and showed itself in different forms to what is called a wide circle of friends, then let it be told, though with all moderation and quietness, yet from a more general point of view. Such lives, though written, or rather perhaps because written, for the few, would be full of interest for the many. Pictures of lives, however homely, so long as they are faithfully done and are free from affectation, whether they are on canvas or in type, are sure to be studied with eager attention.

We are glad, therefore, that the publication of a *Memoir of a Brother* was an afterthought with Mr. Thomas Hughes. Had he, while the sorrow of his great loss was still fresh in him, sat down to let the world know how good a man it had lost, in all likelihood he

---

* *Memoir of a Brother*. By Thomas Hughes, Author of "Tom Brown's School Days." London: Macmillan & Co. 1873.

would have failed as much as he has now succeeded. We can easily bring home to ourselves the feeling of weariness with which we might have laid down the more elaborate biography—a weariness akin to that which comes upon us when we reach the end of an epitaph that covers a whole gravestone. Nay, it is not impossible that we might have been so offended by the unintentional exaggeration of the whole book as to have almost taken a feeling of dislike for its really estimable subject; whereas we have now laid down this modest Memoir with a deep feeling of regret that a man so good, so loving, and so worthy of being loved should by one single act of imprudence, one single exposure to a chill, have been torn away from those who might for many years have looked to lean on his strong arm and to draw courage from his true heart. We would not be misunderstood by any means to say that this work is faultless. If we thought that the occasion called for severe criticism, we might justly find not a little to blame in the literary execution of this Memoir. We are glad, however, to feel that we are justified, in the case of a book whose origin is due to such deep affection, and whose tone is for the most part so good, in being blind to what is amiss, and in seeing only what is good. At the same time we cannot but regret that the athletic side of Mr. George Hughes's character should have been quite so strongly brought out. The author is clearly aware of the mischief that is being done by the present outrageous worship of bodily strength and bodily skill, for he says, "I must not tell you so much of all his successes in athletic games. These things are made too much of nowadays, until the training and competition for them outrun all rational bounds." We wonder if it ever crossed Mr. Thomas Hughes's mind how much the author of *Tom Brown's School Days* has to answer for all this. If Muscular Christianity, as some maintain, is a new form of religion, that writer certainly was its prophet. There is no doubt some excuse for the prominence which is given to these sports in the *Memoir of a Brother*, as Mr. George Hughes was a man of no common fame. It would seem that at Rugby he was for years looked back to as were the men of a former generation by those with whom Nestor lived:—

κείνοισι δ' ἂν οὔτις
τῶν, οἳ νῦν βροτοί εἰσιν ἐπιχθόνιοι μαχέοιτο·

Mr. Hughes tells of a wonderful kick by which he gained a match at foot-ball, and the School House "regained its position":—

He had kicked the last goal from "a place" nearly sixty yards from the post. The tradition of that kick was handed down for many years, and, I remarked, was always getting back some few yards; so that, by the time it expired, I have no doubt it had reached 100 yards, and became as fabulous as many other traditions.

Then, too, he was stroke of the Oxford boat in the year when, with only seven men, it won the race at Henley. When we consider how comparatively small thirty years ago was the interest taken in boat-races, and yet read in Mr. Hughes's narrative of the extravagances which followed on the unlooked-for victory, we can only hope that, should Oxford ever again at Putney win the race with a man short, every policeman in London, nay, every soldier in the country, will be drawn up ready to crush the frenzied outburst which would be certain to follow. What happened in those unathletic days in such a quiet village as Henley is certainly striking enough:—

The crew had positively to fight their way into their hotel, and barricade themselves there, to escape being carried round Henley on our shoulders. The enthusiasm, frustrated in this direction, burst out in all sorts of follies, of which you may take this as a specimen. The heavy toll-gate was pulled down, and thrown over the bridge into the river, by a mob of young Oxonians headed by a small, decorous, shy man in spectacles, who had probably never pulled an oar in his life, but who had gone temporarily mad with excitement, and I am confident would, at that moment, have led his followers not only against the Henley constables, but against a regiment with fixed bayonets.

Mr. George Hughes, then, was no common athlete. We can forgive his brother for lingering over the memory of the great deeds he did, and for telling us also of his comrade, F. Menzies, the "Radical reformer" of rowing, and of "the small slice of lemon" which he always saw every man had by him at the start. We can forgive him, as the younger Greeks doubtless forgave old Nestor when he went on to say:—

οὐ γάρ πω τοίους ἴδον ἀνέρας, οὐδέ ἴδωμαι
οἷον Πειρίθοόν τε, Δρύαντά τε, ποιμένα λαῶν.

Those who take an interest in public schools—that is to say, in the opinion of public school men and public school boys, the whole universe—will find in the account given of the school-boy life of the author and his brother much that they will care to read. We ourselves, when we came to one passage in the book, felt the same doubt coming over us that came when we first read *Tom Brown*, as to the soundness of the system which Dr. Arnold worked. No one can have read that story without being shocked by a revolting act of cruelty which is there described. We should like to know how many lashes with the cat an indignant public would fix as the minimum to be inflicted on a set of ragged, base-born scoundrels who should use torture by fire as a means of extorting money. In the book before us Mr. Thomas Hughes says:—

He writes home of everything, in these first years, except of what he knew would only give pain, and be quite useless—the exceedingly rough side of school life as it then existed. A small boy might be, and very frequently was, fagged for every moment of his play hours day after day; and, there was a good deal of a bad kind of bullying. But these things he took as a matter of course, making the best of what was inevitable.

What an athletic Christian calls a bad kind of bullying must have been a very bad kind indeed. The school doubtless had got into a bad state before Dr. Arnold was made Head-master. But Mr. Hughes is writing of a time when he and his brother had been there already six years. Surely, in a far shorter time than that a man with Dr. Arnold's strength of character should have swept all cruelty clean out of Rugby. It is a matter utterly beyond our understanding how a man who has all the power that belongs to the head of a school, whether great or small, should not make short work with all bad kinds of bullying, and have the accursed thing put clean away from among his boys. Dr. Arnold, on the one hand, was, if we mistake not, far too tolerant of schoolboys' fashions and traditions, which, when leading to wrongdoing of whatever kind, ought to meet with the most summary justice. But, on the other hand, he had, we have little doubt, a far greater horror of sin than of suffering. His nature was stern. He could hardly, we should imagine, have believed in the exquisite suffering that can be undergone in childhood by those who are gifted with nerves of anything but iron, and who carry a heart as full of feeling for others as it is all shrinking in itself. Well does the father of the two brothers, in writing to his eldest son, when he was now a sixth-form boy, urge him "to protect the junior boys in their little comforts and privileges." Well also does the eldest brother—the subject of this Memoir—years afterwards, when he has in his turn a son at Rugby, write to him:—

There is one lesson which you ought to learn from your present feelings of discomfort and worry; when you are a big boy at Rugby, and see any poor little fellow worried and uncomfortable, you must say a kind word to him (remembering what you once felt yourself); you have no idea how much good a kind word from a big fellow (what you call a swell) will do to a poor little beggar.

We are sorry to find from a letter which Mr. George Hughes wrote in 1868 how great was the power in the school that was still held by those who were merely good at games:—

All the power and influence is in the hands of the athletes, and the sixth form and all the rest pay them (the athletes) the greatest respect, and the most willing obedience. They obey the sixth (lawful authority) less willingly. All this is not quite satisfactory, but it might be worse. At all events Temple, who is a tremendous Radical, knows it and allows, nay, encourages it. But I find that few people are Radicals in their own departments.

After all, the heroes of our great schools and Universities differ but little in the glory they seek, and in their fitness to hold rule, from the unlettered rustics of the Deserted Village

that simply sought renown
By holding out, to tire each other down.

Had we space we should like to quote a kind letter which Mr. Hughes and his brother received in their childhood from Miss Edgeworth. They, with all the courage of seven and eight years of age, "had laid their heads together and written two letters asking her to tell them what were the contents of the remaining drawers in the wonderful Indian cabinet" that we read of in *Rosamond*. After having received such a letter in answer, and after admitting that her books were in his childhood his great delight, we are surprised to find that Mr. Hughes, in writing to his own sons and nephews, says, "you probably have never read her books." We are quite ready to allow that Miss Edgeworth's books are somewhat one-sided, but we know of no better corrective for the far more one-sided stories for the young that are now written—*Tom Brown's School Days*, for instance—than the *Parent's Assistant* and the *Harry and Lucy* that delighted us and our fathers before us. Those, however, who entertain respect and affection for Miss Edgeworth's memory will find not the least interesting part of the work before us in this kindly letter of hers to her youthful admirers. We must find space for one more quotation, as in a very few lines we get a great deal of humour. Mr. George Hughes is describing a scene that took place at Pau, where he passed the winter:—

There was a scene at the opera the other night. The conductor of the orchestra is the *amant* of the contralto. Just before the opera began, the conductor in a jealous fit tried to strangle the contralto: whereupon the basso profundo knocked the conductor down: whereupon the conductor ran off towards the river to drown himself: whereupon he was knocked down again to save his life: whereupon he threatened to cut everybody's throat: whereupon he was locked up in prison, and there remains. So there is no conductor, and the contralto can't sing from the throttling.

We have not tried to present to our readers any sketch of the character of the subject of this Memoir. The Memoir itself is but a sketch, and would only be spoilt by condensation and analysis. Those, however, who have a spare hour on their hands might well spend it in studying the character of one who, in his brother's words, "was only a good specimen of thousands of Englishmen of high culture, high courage, high principle, who are living their own quiet lives in every corner of the kingdom from John o' Groat's to the Land's End."

MAY.*

WE should be sorry to place any limits to industry, and we know that the amount of productive power varies in each individual writer; that some minds are like the elephant, capable of only rare efforts, while others are like rabbits, that bring forth young at all seasons and in large numbers. But then the one is an elephant, living long and serving humanity while it lives, and the others are only rabbits. George Eliot is a slow worker, while the Ouidas, the Woods, and the Cudlips are prolific. We

* *May.* By Mrs. Oliphant, Author of "Chronicles of Carlingford," &c. 3 vols. London: Hurst and Blackett. 1873.

are sorry to add also Mrs. Oliphant to the list, whom yet we are far from placing in the same category with her feebler sisters. We would rather bracket her with a steadygoing worker like Mr. Trollope, and yet even he would be the better for a rest at times, and a longer breathing space after a continuous strain than he suffers himself to have. One thing, however, we can say of Mrs. Oliphant—fresh or weary, she is always original. Her books have a certain stamp of their own, an individuality of character and an unhackneyed plan of story that go far to redeem some of the faults which time and use and haste only deepen. Whatever she does, she does with all the strength she possesses at the moment; she is thoroughly honest, however exhausted; and her heart is never cold to her labour, though her brain may be tired and her hand heavy. And it is this quality of honesty that raises her work above the ordinary standard of that which is done at too great speed and without taking time enough to rest between whiles.

The gem of this novel, *May*, is the character of May or Marjory herself. She is essentially feminine and natural, loveable and tender, but planned on a nobler scale than is usually assigned to the marriageable young ladies of novels. She is a woman of three-and-twenty, with a young half-sister clinging to her like her child; which also is a relief from the rosebud and bread-and-butter inanities of seventeen and eighteen, so dear to the hearts of many authors. Here we have a woman still young and beautiful and fresh and fair, but with a fine matured dignity and common sense that enrich the story with possibilities of action denied to callow innocence. Consequently she becomes the heroine, not so much by the arbitrary will of the author as by natural and logical necessity. The strongest of the party, she has perforce to bear the heaviest burden; the wisest, she has the most to decide; the most unselfish, she has the most to sacrifice. In all the events that crowd on that first pretty picture when she is seen coming down the High Street of Pitcomlie as if she were a young princess, as indeed she is the princess of that country—and she knows it—to the last unravelling of the painful secret that clears poor Isabell's clouded name and changes the Hay-Heriot succession, she is always beautiful and brave; never once shown in an ugly light, or dwarfed by meanness, cowardice, or self. She is a grand creature, and we congratulate Mrs. Oliphant on the beauty and harmony of her character.

The scene of the story is laid in Scotland, near the small town of Pitcomlie, itself not far from St. Andrews; and Mrs. Oliphant has caught the echo of the racy Scottish humour creditably enough. Miss Jean Hay-Heriot, the old aunt of the present Laird of Pitcomlie, with her keen black eyes and keener tongue, her quick resentments, and her profound belief that the world had been going wrong ever since she left off being young, with a soft place, however, somewhere about her, if only it could be got at—which was difficult, and not often—makes a capital picture of the sterner side of the North British character. The keynote of her nature is struck in the beginning, when Marjory and Milly, in their riding habits, the child with her long hair streaming behind her, come in late to luncheon. Miss Jean "prepared for tempest." "It roused her up sometimes, and gave her a pleasant exhilaration, to get an opportunity of setting 'that girl of Thomas's' to rights." But, cross as she was, and glad of her chance of a tempest, she had ordered a dainty luncheon for her grandnieces; mingling benefits and buffets in that odd way belonging to the crabbed-tempered, kind-hearted old. She plays only a subordinate part in the drama, but she is always effective; her witchlike age and dourness contrasting with the queenly graciousness of May and the childish tenderness of golden-haired Milly, not with a sense of discord, but of completeness. The two brothers, Thomas the Laird, and Uncle Charles, both Hay-Heriots, father and uncle of the girls, are well drawn; but of the two Uncle Charles, though the more important to the story because he has the most to do, is the less satisfactory. "Only a haverel," as Aunt Jean calls him, and at the best of times nothing but a thin, long-legged dilettante, he every now and then displays a pertinacity scarcely in accordance with the leading lines of his nature. His elder brother had evidently kept him well in hand; but he sometimes holds his own with more manliness than seems to belong to him, collapsing as he does when any real strain is put upon him. The Laird comes out more clearly; and the sudden bitterness that invades his kind and loving nature, and turns it all to irritation and injustice under his great sorrow, is wonderfully true to life. Singularly well observed too is the special injustice of his tone to Marjory; she who had done all, borne all, and whose reward from him was only anger and complaint. It is in these nice touches that Mrs. Oliphant excels. She may be neither deep nor philosophical, but she is always keen, and generally delicate and true.

None of the characters, however, are very prominent, save May; and none of them are so purely beautiful. Fanshawe, with whom she has so much to do, gains his chief importance through his association with her and hers; Uncle Charles is hazy; and the Laird her father dies before the core of the struggle is reached. We see the elder brother Tom only on his death-bed, which, though well described, tells us nothing beyond the fact that he has been wild and something worse, and that he dies with a secret undivulged. The other brother, Charlie, is a mere name; and his wife and sister-in-law are rather caricatures than anything else. Women are often painfully silly, we admit, and some are to be found as selfish, vain, and vulgar as Matilda; a few also are as clever as Verna Bassett; but we do not like the portrait of either, and we think that in them Mrs. Oliphant has overstepped the line which separates realism from triviality, and has condescended to something very like spite. A good deal might have been made out of the situation, and the broad characteristics of the two sisters might have been kept; but it would have been a higher kind of art to have toned down the episode into more quietness than our author has allowed; and the drawing would have been stronger had its uglier details been less elaborated. We do not say that it is not natural; it is only too much so. The black nurse and the languid babies; the confusion worse confounded of the untimely arrival; the helpless muddle of all concerned, which every one who has had to do with Anglo-Indian mothers and their babies and ayahs can picture for himself; the mental determination of Verna Bassett to make her own account out of the good luck that has befallen her silly sister through the death of her husband, her father-in-law, and the heir of the estate, all in a breath; Matilda's helplessness and half-idiotic vanity, her physical excitability, and her mental and moral hardness and selfishness—all this is true in the main, if even here we find a tendency to over-breadth. But when we come to the circumstances, say, of the cap and the reading of the will, and of Matilda's appropriation of the mistresshood of Pitcomlie with such a gratuitous amount of insolence, we demur, and question both the artistic truth and moral feeling with which this whole episode has been constructed. It is a new thing to say of Mrs. Oliphant that she is either vulgar or spiteful; but she touches on the brink of these unpleasant qualities in her account of how Matilda Hay-Heriot, or "Mrs. Charles," and Verna Bassett her sister, played their little pranks of brief authority at Pitcomlie, and acted like unmistakable snobs when they masqueraded as ladies of high degree.

The idea of the dilemma in which May is placed, and of the grief and humiliation inevitable whichever alternative she accepts, is excellent. On the one side is Isabell, a Highland peasant girl, with a doubtful story and a plebeian origin. She is, or she is not, "poor Tom's" widow. If she is not, then the memory of the dead is stained with one sin the more, and the sister has still more cause to blush for than to lament her favourite brother. If her story is true, and her child is really legitimate, then the proud Hay-Heriots have received a wound they can never get over, and the glory of their family traditions is tarnished for all time. Yet anything would be better than Matilda and Verna as the mistresses of Pitcomlie; and in any case *fiat justitia* holds good. Still the dilemma is a grievous one for Marjory, proud, fond, and true as she is; and as it is her hand which has to give the blow in any case, her position is a hard one, and we do not wonder at her sending for her friend Mr. Fanshawe to help her out of her difficulties.

The love affair between May and Fanshawe is very prettily described. It is of the gradual, unimpassioned, and sensible kind which is so like reality and so unlike love-making in novels in general. They do not soliloquize to the moon, nor kiss frantically in the woods, nor have brain fevers because things go cross, nor give up all their social chances in life for the sake of a few months' earlier marriage, nor do anything of the mad and mischievous kind; but they drift quietly from indifference to pleasure in each other's society, from pleasure to doubt, from doubt to resolve, and from resolve to certainty; the stages interspersed with the little starts and flights which belong to the devious road on which they are travelling, and which give life and colour by the way. And there always comes in the golden head and clinging fondness of little Milly, to add that half-matronly purity and responsibility which does so much for Marjory's character. There has seldom been a more successful portrait of a child than this of Milly. She is nothing wonderful in any way; just a "bonnie bit bairn" of ten or so, who rides about the country with her sister, and follows ever after her like her shadow, who has long bright golden hair that streams in a mane behind her, who cries copiously for vague sympathy and vaguer "dool" when their troubles come on the family and "my May" is distressed, and her father estranged. She says her prayers, and reads heavy Sunday books as the right thing to do when they are all in grief and mourning; and when Fanshawe makes her laugh right out, she feels conscience-stricken, as if she had committed an impiety. She is probably not very clever, not very promising, not very anything; but her presence in the story is one of the prettiest things in it: and Mrs. Oliphant has proved herself a master of the art in this sweet and lifelike child's portrait. If novel-writers would only go more to nature for their models, and trust less to their own sickly fancies, we should have better work than we have now. But, indeed, the mass of unreal and unripe fiction poured weekly from the press is a grave matter as a sign of modern intelligence; and when we reflect that not half-a-dozen of our present authors write of life as it is, not half-a-dozen are able to make beauty and interest and poetry out of the ordinary conditions of humanity, but either stoop to filth or soar into absurdity, we may accept with gratitude such work as Mrs. Oliphant's, even though in this, her latest production, she has given signs that she would be all the better for a rest, and a spell of playtime void of pen and paper.

FRENCH LITERATURE.

BARON VON HÜBNER has published in two thick octavos the narrative of his travels round the world.* He started

* *Promenade autour du monde.* Par M. le baron de Hübner. Paris and London: Hachette & Co.

from Ireland on the 13th of May, 1871, and arrived at Marseilles on the 13th of January, 1872, after having visited North America, California, Japan, and China. The interesting volumes with which he presents us are merely the transcript of his diary, but they show us the impressions of a man who, whilst seeking recreation, turns to account the observations he is enabled to make, and studies society from the point of view of a politician. The simplest facts which he witnesses serve the purpose of illustrating some striking trait in the character of the people amongst whom he is thrown, and his work is much above the ordinary average of productions of the same class. We would especially draw the reader's attention to the chapters bearing upon Mormonism and the Salt Lake City.

The problem which M. Moreau de Jonnès has attempted to solve in his new volume * is one of those which for want of properly authenticated data must ever remain *sub judice*. When did the meeting take place, in pre-historic ages, between the races of the North and those of the South? When did that fusion begin from which sprang in the first instance the Ethiopians, and afterwards the Semites and the Aryans? Our author points to the shores of the Euxine as the probable locality. Five thousand years ago, he says, an immense sea occupied the space now held by Russia, Poland, and Tartary; northwards it was confounded with the Baltic and the Arctic Ocean; in the South it joined the Caspian and the Sea of Azov. Seven islands were, he conjectures, scattered over that broad expanse, the largest of them being the Atlantis described by Plato. Such was the spot where that union occurred of which M. Moreau de Jonnès speaks, and in support of his theory he gives a number of details which are about as valuable as the theory itself. Thus he identifies Hades with the Crimea, and places the Elysian Fields in the island of Saman; according to him, the Ogygia mentioned by Strabo was on the same spot, and the birth of Pallas Athene—which he apparently regards as an historic, or at least a pre-historic, fact—occurred near the Sea of Azov. We must say that pre-historic history is a difficult and hazardous subject to write upon.

The numerous contributions on scientific subjects made by M. Littré to French periodicals, both before and since his conversion to Positivism, have been collected by him into a volume.† We need scarcely say that on every occasion the disciple of Auguste Comte endeavours to bring forward the leading characteristics of his system, and to explain the new laws which determine the progress of society. His main idea is the regular logical deduction of all sciences from each other, beginning with mathematics and ending with what is called sociology. This sequence admits of no variation, and is as unchangeable as the order in which the strata of the earth present themselves to the geological observer. M. Littré explains this in his preface, and takes the opportunity of criticizing Mr. Herbert Spencer's system of interdependence, as in contradiction to the conclusions of Positivism. In reviewing M. François Lenormant's *Manuel d'histoire ancienne*, he sketches the programme of universal history; of course, with him the Bible has no more weight than any work of merely human origin, and all ideas of a merely theological character should, he maintains, be excluded from treatises which aim at being scientific. Accordingly he repudiates altogether the account given in the Book of Genesis of the creation of man, and classifies the various nations of the old world in an order different from that received by most authors. M. Littré's views on the manner of studying and conceiving history are developed in his article on M. Renan's *Histoire des langues sémitiques*, and in a lecture which he delivered, at M. Gambetta's request, on February 1, 1871, before the pupils of the École Polytechnique.

The Count du Barry de Merval professes to be, not an archæologist, but a mere amateur.‡ Travelling in Egypt, he is struck by the architectural remains scattered in such profusion over the country. He studies them, and endeavours to deduce from his researches the laws according to which those imposing structures have been erected. The result is a valuable monograph in which every point connected with the architecture of the Egyptians is carefully discussed—the materials used, the arrangements of temples, palaces, sepulchres, the introduction and application of painting and sculpture. He devotes a chapter to a suggestive account of the relations existing between the architectural style of the Greeks and that of the Egyptians; and he shows how the former, after proceeding from the latter, modified it in its turn.

The *question ouvrière* §, as our neighbours call it, is one of such importance that any work relating to it is sure to receive attention. The Count of Paris has evidently given much thought to the great social question of the age, and he has endeavoured to bring together the data from which an equitable code of laws may be framed. His book, divided into three parts, explains what has hitherto been done in England. Wages, Trade-Unions, and Acts of Parliament relating to the protection of the rights both of masters and men, are among the subjects discussed in his lucid and well-written treatise.

Another book on the France-Prussian War ‖! Baron Ambert, however, has aimed less at writing a military history than at putting together a series of reflections on the political events which preceded and accompanied the invasion of France by the Germans. His Imperialist sympathies are apparent even in the few words of dedication prefixed to the volume; they show themselves in every page, and no words of contempt are strong enough when the men of the 4th of September, their principles and their actions, have to be characterized. Baron Ambert opens before us an amusing gallery of portraits, and, if some of them are caricatures, yet in most cases the resemblance cannot be denied. He is very severe upon Marshal Bazaine, whom he charges with incapacity, selfishness, indifference for his soldiers, want of energy and of foresight. General Trochu, too, is roughly handled; and as for Garibaldi and his followers, they are treated with a contempt and hatred which will perhaps call forth an angry reply on the part of the Republicans. Baron Ambert's conclusion can easily be guessed; the Revolution is the cause of all the evils from which France has been suffering, and, to quote his own words, "Whilst the Emperor was falling on the field of battle, the Revolution stabbed him behind." It might reasonably be objected here that Napoleon III. was the very man who caused the catastrophe by which he was finally overthrown. When, however, our author expresses his opinion that the only chance of safety for France is in a return to the ideas of morality and to a sound religious and intellectual training, he will no doubt find an echo in the breast of every true patriot. An atlas accompanies this volume, which, notwithstanding its prejudiced point of view, forms a valuable contribution to the military collection published by M. Plon.

Several scholarly works have been issued from time to time on the mediæval French theatre *, and the principal mysteries, moralities, and farces which form so important a part in the earlier literature of our neighbours are now easily accessible to the general reader in cheap and well-edited books. We would notice, amongst others, the collection published by MM. Francisque Michel and De Monmerqué, under the title *Le théâtre français au moyen-âge*, the ten volumes which the late M. Jannet issued in his *Bibliothèque Elzévirienne*, and the duodecimo prepared by M. Paul Lacroix (bibliophile Jacob) for M. Delahays's *Bibliothèque gauloise*. We have now to examine a magnificent volume for which we are indebted to M. Édouard Fournier, and which seems to us the best work of the kind ever given to the public. The great defect of all previous reprints of mediæval plays is that they merely supply the text, and add nothing whatever in the way of notes, glossarial elucidations, &c. They are, in fact, intended either as bibliographical curiosities, or as hand-books for scholars whose acquaintance with the grammar of the langue d'oil enables them to dispense with critical and historical explanations. M. Fournier appeals to a wider class of readers, and he has done so very successfully. From the rich and curious collections previously consulted by MM. Jannet, Leroux de Lincy, Michel, Lacroix, and others, he has chosen a series of excellent plays belonging to the respective categories of mysteries or miracle-plays, moralities, *sotties*, and farces; he has added the *chefs-d'œuvre* of Pierre Gringore and Roger de Collerye; and a comedy by Marguerite de Navarre takes us to the opening of the Renaissance period, when the drama, as well as other branches of literature, underwent a complete transformation. One specimen, and one only, the *Farce du porteur d'eau*, belongs to the reign of Louis XIII., and M. Fournier inclines to think that the piece was probably a corrected reprint of some old drama. The volume contains no less than fifty plays, each of which is preceded by a brief notice and an argument; the introduction gives a general account of the French stage, from its earliest beginnings to the sixteenth century. It has often been observed that the glossaries added to collections of this kind were exclusively taken up by the explanation of grammatical and etymological difficulties; this was peculiarly the case with the otherwise excellent index which forms the tenth volume of M. Jannet's *Ancien théâtre français*. M. Fournier gives no glossary at all; but his foot-notes supply every verbal elucidation required, together with a full discussion of the numerous historical, antiquarian, political, and social allusions contained in the text. A series of coloured engravings has been added representing the principal *dramatis personæ*.

M. Marty Laveaux deserves well of the public for his elegant edition of Rabelais.† The third and concluding volume of the text just published contains the Fifth Book of the *Pantagruel*, and several pieces which are usually appended to the great work of the jolly curé of Meudon; we mean the *Pantagrueline prognostication*, the almanacks, the *épistre du Lymosin*, and the *cresme philosophale*. Scholars interested in documents bearing on the biography of Rabelais will find an ample harvest in the letters, dedications, commendatory verses, &c., which form the latter half of this elegant octavo.

The chatty, entertaining *Mémoires du peuple français* ‡, by M. Augustin Challamel, are now finished; the eighth volume begins with an account of French society during the age of Louis XIV., and ends with the Revolution. In this panorama, where the clergy,

the magistracy, the nobility, and the people are brought together, we have often to notice details which would be perfectly incredible if they could not be shown to be well authenticated. The *Recueil de Maurepas*, the *vaudevilles*, squibs, and lampoons of the times have been freely consulted by our author, and it would be amusing to compare his statements with the flattering and untrustworthy narrative of Voltaire. As we get fairly into the eighteenth century the interest of the book becomes greater; we have the quarrels of the Parliament with the Court, the scandalous orgies presided over by the Regent, the Jansenists and the *convulsionnaires*, the Encyclopædists, the Paris *salons*, the financial speculations of Law, and the political intrigues of Cardinal Dubois. The picture, though overcrowded perhaps, is well worth studying, because it shows to what a state of corruption the *ancien régime* had sunk when the taking of the Bastille marked the beginning of a new era in the history of the country.

M. Jules Barni * is a staunch admirer of the eighteenth century; but he is not blind to the errors which some of Voltaire's and Rousseau's disciples committed, and whilst he praises the *Émile* and the *Contrat social*, he denounces in severe terms St.-Lambert's *Catéchisme* and the works of Volney. This third volume of the *Moralistes français* contains sketches of writers who may be said to have formed the minor group of free-thinkers; Vauvenargues opens the list, then come Duclos, Helvétius, St.-Lambert, and Volney. It would be an interesting question to discuss whether the extreme doctrines upheld by the last two authors especially were not the legitimate development of the theories which they had learnt in the school of Voltaire, and also whether the admiration of brute force, as it appeared in Napoleon's despotism, was not the natural consequence of a system which looks upon man merely as a clever piece of mechanism; but we cannot here enter upon such considerations. M. Barni's third series of lectures fully equals in merit the other two, and his copious extracts from the writings of the philosophers whom he criticizes are well chosen. When noticing Volney's teaching at the École Normale, he might have said a few words about Garat and the celebrated controversy which that lecturer carried on with St.-Martin, the *philosophe inconnu*.

Several important works have at different times been published on Christian art, and the names of MM. Rio and Didron will suggest themselves at once to persons who are acquainted with the subject; but M. Grimouard de Saint-Laurent † aims at something more ambitious than either of those writers; he seeks to unfold before the reader the whole history of Christian æsthetics, to show its successive manifestations, and the various characteristics it has displayed notwithstanding its substantial unity. We have now the first volume of a work which is to comprise four other instalments. The introduction gives a sketch of the progress of religious art from its earliest beginnings to the present day. The author shows how the twofold current of idealism and realism has affected the production of great specimens of painting, sculpture, and architecture, and he describes the principal episodes in the struggle. What he calls the "grammar of the language spoken by Christian artists" forms the subject of the first part of the book. Study of drawing and of colouring, composition, laws of perspective, arrangement of draperies, attitude and expression, formation of groups, distribution of light and shade—all these topics are discussed at considerable length. M. de Saint-Laurent has of course illustrated his teaching by numerous engravings taken from the best models of Christian art; these figures are admirably drawn, and some of them are masterpieces of correctness and of finish.

M. Édouard Chevalier in a very suggestive book ‡ considers the best way in which a fleet can assist land forces, supposing the case of a Continental war. Since the conclusion of the peace of 1871 public attention, he says, has been directed towards the apparent inactivity of the French navy whilst the war was going on. Why did not an extensive landing of troops take place on the German coasts, thus creating a diversion which could have been turned to good account? M. Chevalier shows that the disasters of the campaign rendered this course quite impracticable, and as soon as the French Admiralty knew that it was impossible to reckon upon the co-operation of a *corps de débarquement*, the notion of an attack on Kiel and the Jahde was out of the question. The problem, examined from a general point of view, may be thus stated:—What operations have been heretofore undertaken by fleets condemned, on account of their very superiority, to inaction as naval forces? In answering this question, our author begins by discussing the campaign of 1870–71, and he then seeks for further examples in the history of the Crimean expedition, and of the War of Secession in the United States. His conclusion is that a fleet must necessarily act in close combination with land forces if it is to render any substantial service, and that for this reason no blame whatever can be attached to either Admiral Rigault de Genouilly or Admiral Fourichon on the ground that during the late war their activity did not correspond with that displayed by the other branch of the service.

The anonymous *conservateur, rédacteur du "Français"* § does not bring back with him a very favourable impression of the "red countries" which he has lately visited, and his experience corroborates in a striking and amusing manner that of Baron Aubert, already noticed. Twelve letters, dated from various towns in the South of France, tend to show that the Conservative element is still extremely strong there; and that, but for the hesitation of the Government officials, who were cowed by the threats of a noisy minority, the patriotic firmness displayed by many friends of order would have rendered even the temporary triumph of Radicalism impossible. M. Thiers was, we are told, systematically kept ignorant of what was going on amongst the excitable populations of Avignon, Marseilles, Arles, and the surrounding districts, and the prefects nominated under the pressure of local influence were in most cases not the representatives of the law, but mere tools in the hands of the demagogues.

Madame Quinet's journal of the siege of Paris * gives us day by day an account of that terrible episode in the war. We need scarcely say that a deep hatred of Napoleon reigns throughout these short and burning paragraphs, written under the pressure of passing events; the Government of September 4 is likewise very severely treated, and the attempts at insurrection made by Delescluze, Flourens, and their friends, previously to the great outburst of the Communist civil war, are regarded as abortive efforts which the enemies of the Republic purposely exaggerated. M. Edgar Quinet's preface summarizes the impression conveyed by the work itself. While certain writers would fain make us believe that the invasion of France was the idea of the Prussian Government, carried out in distinct opposition to the sympathies of German democracy, we find recorded here what seems to us very much nearer to the truth—namely, that the whole German race supported most cordially Prince Bismarck's policy, from the wish to avenge in a signal manner the humiliations which it had endured under the despotism of Napoleon I.

The same spirit characterizes the *Journal d'une Parisienne* †, for which we are indebted to Madame Edmond Adam. It differs from Madame Quinet's volume inasmuch as it initiates us more completely into the political life of Paris after the capitulation of Sedan, and it gives us, in an amusing, gossiping way, an account of the formation of the Republican Government, and of the difficulties amidst which it was established. M. Adam himself, our readers may remember, held office at that time, and his relations with the leading representatives of the Liberal Opposition have enabled his wife to give us curious details respecting MM. Pelletan, Rochefort, Welfitzer, Gambetta, &c.

After having admired the energy of which patriotism is capable when danger stares a whole nation in the face, we turn with melancholy interest to the records of the crimes which disgraced Paris under the Commune, and which have done so much to discredit Republican institutions even in France. ‡ M. de Pontmartin may perhaps be wrong when he says that the Government of September 4 was particularly distinguished by the spirit of impiety, but it certainly took no efficient steps to prevent the orgies of the party represented by Raoul Rigault and Flourens. The repulsive details published by M. Paul Fontoulieu, first in the *Figaro* newspaper, and now in the present volume, are sad memorials of a state of moral decomposition which would ruin society if left unchecked and unpunished.

We must briefly mention a new educational work §, forming part of MM. Hachette's series. It is a small volume, containing easy French stories for young children, the majority of which have never yet appeared in collections of this kind. This collection may be regarded as a natural introduction to the French Reader published by the same editors. It is accompanied by a vocabulary.

JOHN EVERETT MILLAIS, R.A., *Hon. Secretary*.
FREDERIC W. MAYNARD, *Assistant-Secretary*.

24 Old Bond Street.

ROYAL LITERARY FUND.—The EIGHTY-FOURTH ANNIVERSARY DINNER of the Corporation will take place in Freemasons' Hall, on Wednesday, May 28,

The Right Hon. W. E. GLADSTONE, M.P., in the Chair.

The Stewards will be announced in future advertisements.

10 John Street, Adelphi, W.C. OCTAVIAN BLEWITT, *Secretary*.

MR. J. A. FROUDE, M.A., will PRESIDE at the ANNUAL DINNER of the NEWSPAPER PRESS FUND at Willis's Rooms, Saturday, May 17.—Tickets, 21s., to be had of the SECRETARY, 21 Cecil Street, Strand.

BRITISH and FOREIGN SCHOOL SOCIETY.—The SIXTY-EIGHTH GENERAL MEETING of this Society will be held on Monday, May 12, 1873, in the Large Schoolroom, Borough Road.

The Chair will be taken by the Right Honourable the Earl RUSSELL, K.G., at Twelve o'clock.

The Borough Road College and Schools will be Open to Visitors from Ten A.M. to Twelve noon.

Tickets may be obtained by application at the Society's House, Borough Road.

ALFRED BOURNE, *Secretary*.

THE LONDON INTERNATIONAL COLLEGE. *Principal*—Dr. L. SCHMITZ, F.R.S.E., late Rector of the High School, Edinburgh. The SUMMER TERM will COMMENCE on Monday, April 28, 1873. Applications for Admission should be addressed to the PRINCIPAL, at the College, Spring Grove, near Isleworth, Middlesex.

THE LONDON CIVIL SERVICE and MILITARY COLLEGE, 21 York Place, Portman Square, W.—*Principal*, Dr. HEINEMANN, F.R.G.S. Special and thorough PREPARATION for Cooper's Hill, the Line, Woolwich, the Civil Service, &c.

PREPARATORY EDUCATION at SCARBOROUGH.—The Rev. JOHN BEDFORD (M.A., late Scholar of Linc. Coll., Oxon, Head Classical Assistant-Master at Cheltenham School, 1860-1865, and Curate of Scarborough, 1865-1872) receives into his House a limited number of BOYS to prepare for Eton and the other Public Schools, for the Civil Service, &c. Having just annexed the House adjoining his own to accommodate some new Boys, he has some additional Vacancies.—For Terms, &c., address, Belgrave Crescent, Scarborough.

THE LADIES' COLLEGE, Grosvenor Square, SOUTHAMPTON. Founded by the Hampshire Association for Promoting Female Education. *Patrons*—The Bishop of WINCHESTER; Viscount EVERSLEY; Lord NORTHBROOK. *President*—The Right Hon. W. COWPER-TEMPLE, M.P. The SPRING TERM commences May 1. Applications for the Prospectus and for Entries may be addressed to the HONORARY SECRETARY, or to the Lady Principal, Miss DANIELS.

THE ABBEY SCHOOL, Beckenham, Kent.—Careful PREPARATION for the PUBLIC SCHOOLS; age from Eight to Fourteen; number about Forty. Boys above Twelve have each a separate sleeping apartment. Large playground and detached infirmary. Beckenham is half an hour by rail (London, Chatham, and Dover) from London, seven minutes from Crystal Palace, and on gravel. Boys met, if desired, at any London station. Summer Term begins May 1.—Address, Rev. T. LLOYD PHILLIPS, M.A.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon (formerly Principal of the Elphinstone High School, Bombay), will continue, with the Assistance of a Cambridge Honours-Man, to prepare PUPILS for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations.—Terms and References on application.

THE HARTLEY INSTITUTION, Southampton.—In the Department of General Literature and Science, CANDIDATES are prepared for the Indian Engineering College, and all other Public Competitive Examinations. In the Department of Engineering and Technical Science, YOUTHS are trained, both Theoretically and by a Course of Practical Instruction in Laboratories, Workshops, and on Works of actual Construction, for Engineering, Architecture, Surveying, and other Technical Occupations, and for the Engineering Service of India. In the Department of Preliminary Medical Education, STUDENTS receive Instruction in the Elements of Medical Science, with opportunities for Dispensing and Hospital Practice.—For Prospectus, address THE LIBRARIAN.

HIGHFIELD SCHOOL, Weston-super-Mare.—Conducted by a Wrangler, assisted by a Graduate in Classical Honours. Terms, 45l. Specially adapted for delicate Boys.—Address, GEORGE HEPPEL, M.A.

EDUCATION.—BRIGHTON.—The Rev. H. FYFFE, M.A. Oxon, has VACANCIES at Clifton House, West Brighton. Large Playground, Cricket-field, Gymnasium, Fives Court, excellent and safe Bathing. Pupils have taken high places in the University, Local, Military, Civil, &c. Examinations, and at the Universities. Junior and delicate Boys receive special attention. Terms, 60 to 100 Guineas.

MILITARY APPOINTMENTS and CIVIL ENGINEERING. The Rev. W. H. JOHNSTONE, M.A., formerly Professor, Examiner, and Chaplain in the Military Engineer College, Addiscombe; and Assistant-Examiner for the Indian Civil Engineer Service; continues to prepare CANDIDATES for Woolwich, Cooper's Hill, Direct Commission, &c. Address, Bromsgrove House, Croydon.

AN OXFORD M.A. in Holy Orders, Single, quitting a Tutorial post, held in a Family for eight years, seeks an engagement in or near London with the SONS of a NOBLEMAN or GENTLEMAN. Highest references.—Address, C. H., 7 Charing Cross.

A BONUS of £50 to £100 will be paid to any Gentleman who procures Advertiser a PERMANENT SITUATION. The Advertiser is a retired Assistant-Paymaster Royal Navy, and can give high references, &c. His antecedents will bear the strictest scrutiny, and his address is good. All Replies will be treated as Confidential. No Capital to Invest.—Address, R. O. F., care of Davies & Co., Advertising Agents, Finch Lane, Cornhill.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician* Dr. EDWARD LANE, M.A., M.D. Edin. Turkish Baths. Consultations daily (Saturday excepted) at 7 Princes Street, Hanover Square, from Ten till Twelve.

OVERLAND ROUTE.—The PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY BOOK PASSENGERS and receive Cargo and Parcels by their Steamers for

	From Southampton.	From Venice (calling at Ancona).	From Brindisi.
GIBRALTAR, MALTA, ALEXANDRIA, ADEN, BOMBAY	Every Thursday, at 2 p.m.	Every Friday Morning.	Every Monday, at 5 a.m.
GALLE, MADRAS, CALCUTTA, PENANG, SINGAPORE, CHINA, JAPAN	Thursday, May 8 and 22, at 2 p.m. and every alternate Thursday.	Friday Morning, May 16 and 30, and every alternate Friday.	Monday, May 19 and June 2, at 5 a.m. and every alternate Monday.
AUSTRALIA, NEW ZEALAND (Cargo only)	Thursday, May 8, at 2 p.m. and every fourth Thursday.	Friday Morning, May 16, and every fourth Friday.	Monday, May 19, at 5 a.m. and every fourth Monday.

Abatements are made in favour of Passengers returning by the Company's Steamers within Six or Twelve Months of their arrival.

Passengers are now booked through, via Rome, to the principal Railway Stations in India, and through Tickets to Venice and Brindisi are issued at the Company's Offices. Tickets to Brindisi only can also be obtained from Messrs. LEMAU & Co., 9 Billiter Street (South Italian Railway Offices).

For Rates of Passage Money and Freight, and all other information, apply at the Company's Offices, 122 Leadenhall Street, London, or Oriental Place, Southampton.

INDIAN PARCEL POST. Under Authority from the POSTMASTER-GENERAL of INDIA.

Parcels not exceeding fifty pounds in weight and 2 ft. × 1 ft. × 1 ft. in size, and £20 in value are conveyed by the PENINSULAR AND ORIENTAL COMPANY from London to any Post Town in India at a uniform charge of 1s. 6d. per lb. Full Particulars on application at 122 LEADENHALL STREET, E.C.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to The MANAGER, Bedford Hotel Company, Limited.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 915, Vol. 35. May 10, 1873. [Registered for Transmission abroad.] Price 6d.

THE IMPERIAL MEETING AT ST. PETERSBURG.

THE Emperor WILLIAM has been paying a return visit to his nephew, and everything has been done that the Emperor ALEXANDER could devise to show honour to his uncle. There are but a limited number of means by which a royal guest can have his visit made satisfactory to him. Illuminations, dinners, balls, and reviews must make up the programme on every such occasion; and all that could be done has been done at St. Petersburg to make them each after their kind as splendid as possible. The especial pleasures offered to the Imperial visitor in the Russian capital were a visit to the tombs of the Czars and of the Imperial Family, including that of his sister, the wife of the Czar NICHOLAS, a call on General TODLEBEN, who gave him a lecture on a model of Sebastopol, and the treat of an evening at the French theatre, which, since the War of 1870, he has not been able to enjoy at Berlin. The German EMPEROR was attended by his great Minister and his great General, and the people of St. Petersburg enjoyed, and perhaps abused, the satisfaction of being able to stare at Prince BISMARCK and Count MOLTKE. For the latter it is said that they felt nothing but the unbounded admiration naturally conceded by a military nation to the first commander in Europe. Prince BISMARCK provoked more mingled feelings, and envy or fear even found utterance in a few hisses entirely out of keeping with the cordiality towards the visitor and his suite which was enjoined so far as official injunctions could reach. The CZAR seemed delighted with an occasion of proclaiming, not so much to the world, or even to Germany, as to his own subjects, how very great is the value which he sets on the maintenance of the most friendly relations possible with the Court of Berlin. To preserve these friendly relations has been the special policy of his reign, and Prussians would be very ungrateful not to acknowledge how much they were indebted in 1866 and 1870 to the personal wish of the CZAR to protect and favour the interests of his uncle. On this occasion he has announced that not only is this policy one on which he has set his heart, but that he sees in its maintenance the best security for the preservation of peace in Europe. What was said at Berlin last September is being said over again at St. Petersburg. The league of the uncle and nephew and of their brother EMPEROR at Vienna is a league of peace; and the German EMPEROR was especially earnest in proclaiming at St. Petersburg that the mere fact of the constitution of an Empire like the German Empire in the centre of Europe is a new guarantee for peace such as Europe has never had before. Each EMPEROR offers the other the pleasure of seeing the best of his regiments and the finest of his soldiers, and each assures the other that the mere fact that his brother Sovereign has been so kind as to come and look at this splendid machinery of war is an indisputable pledge that it is not likely to be put to a serious use. This is certainly the most comforting view of the purpose of expensive armies that could be suggested to overburdened taxpayers. They are, if the EMPERORS who command them are to be trusted, kept on foot in order that foreign sovereigns who see them reviewed may give so much pleasure by being present at the sight, and may receive so much pleasure from it, that a war is next to impossible.

No indications of national policy can really be gathered from the fact that one sovereign is very civil to another, and lights up his capital for him and has dinners and reviews for him. On the occasion of the last French Exhibition the Emperor of the FRENCH made a special point of the attendance of the King of PRUSSIA, and seemed as if he could not enjoy the Exhibition unless his pleasure was shared by the conqueror of Sadowa. Subsequent revelations have informed us that this brotherly visit was paid immediately after the host had deferred war simply because all his best generals had told him his army was not ready, and after the guest had disappointed the calculations of French diplomacy by declaring that the French could not have an inch of German soil conceded to them. Both host and guest knew that their meeting had no tendency whatever to avert the coming struggle to which they both looked forward. On the other hand, when a sovereign who is possessed of great personal power, and whose position is such in his country that what he wishes is really attended to simply because he wishes it, cultivates honestly and cordially an alliance, his sympathies may have a real influence on the history of nations. There was a time when the personal sympathies of the late Emperor NAPOLEON for England kept France, or at least the military and predominant party in France, from a war with England which would have been most welcome to them. That the CZAR honestly loves and reveres his uncle, and thinks that Germany is the best ally he can have, is a fact which very largely contributes to preserve the peace of Europe, and the Germans have already reaped considerable benefit from it. But, as usual, inspired panegyrists try to make too much of their case, and both in Russia and in Germany critics have found that they cannot go quite as far as official enthusiasm would wish them to go. In Germany, for example, a semi-official journal has recorded all the occasions on which the present King of PRUSSIA has in his long life been brought into contact with Russia; and, to read the tale as told in this way, any one would think that Russia had been consulting the convenience of Prussia and promoting its interest without intermission from the date of the battle of Leipsic. It will be only a very young generation of Germans who can believe this, and their elders cannot forget the sad days of humiliation when the nascent aspirations of Prussia towards German unity were rudely crushed by Russia, and a yoke of Russian supremacy was imposed on Prussia which was broken finally, not by the efforts of Germans, but by the victories of the Allies in the Crimean War. In the same way the courtly eulogist of Berlin cannot express his happiness at the stable condition and peaceful proclivities of Russia and Germany without having his fling at the unfortunate States of Western Europe. France and Spain undoubtedly present examples of States going through times of difficulty; but it is neither wise nor generous for the politicians of one country to be always pointing out how much better they manage things than the politicians of another country. If a Berlin official writer is sincere in his wish that France and Spain should again enjoy what he would consider to be a good Government, he must be aware that the surest method of driving Frenchmen and Spaniards in an opposite direction is to keep dinning in their ears that their goings on are looked on with disfavour at Berlin and St. Petersburg.

The German EMPEROR was prudent enough to abstain at St. Petersburg from using any language that could bear such a construction. He was anxious to avoid giving offence to any one. That he might give offence somewhat easily was probably brought home to him by the many symptoms which must occasionally have forced themselves on his notice that the friendship of Russia for Germany is a friendship of the Court rather than of the people. The CZAR likes the Germans, but his subjects do not. Directly the pressure of official inspiration is removed and the Russian papers are free to speak, they begin with remarkable heartiness and unanimity to abuse Germans and Germany. They make the most of every sign of German weakness, and delight in prophecies showing that in the little struggles which go on in Galicia or Bohemia or elsewhere between Germans and non-Germans, the side

favoured by Russia is sure to win, and the side disliked by Russia is sure to lose. There are many causes for this unfriendliness of Russians towards Germany. In the first place, the mere fact that their own Government represses its manifestations probably adds fuel to the flame, for even the most loyal of nations may get wearied of being bid to love its sovereign's uncle. Then the Russians cannot bear the Germans in Russia, who are too pushing and exacting and far too industrious for them, who make better officials and clerks and merchants than they do, and who in one way or another are always getting much more than what Russians think their fair share of plums out of the pudding. Then there lurks in many Russian minds a sort of schoolboy feeling that, as the Germans have beaten the Austrians and the French, they are sure to try to beat the Russians also, simply because there is no one else for them to beat. This feeling does not perhaps make Russians uneasy. Every nation probably, except England, believes in its army till it is beaten, and Russians may take for granted that Germany would attack them in vain. But the apprehension that a struggle is coming some day produces an irritation which Germans who remember how irritated they were by the persuasion that, before long, France would attack them, must allow to be natural. The apprehension is, in the case of the Russians, apparently a groundless one, for neither Germany nor Germans have ever shown any real wish to embark in a causeless and wanton war with Russia. But the Russians may dislike the Germans, and their irritation at the thought of such a war may help to produce this dislike, although that irritation may be due to a misapprehension of German policy. Lastly, there is a vague sense among Russians that a new obstacle has grown up between them and the realization of some of the dreams they have been taught to cherish, and that this obstacle is the German Empire. Russians may not have any precise notion of what it is that they want, and they may be content to wait very patiently for it, whatever it may be. But they have been taught to believe that there was something very splendid planned as the gift of the future to them by their great CZAR, and that they were drawing nearer and nearer to the enjoyment of this acquisition. They cannot help now being alive to the fact that their prize will not be so easy to get as they fancied, and that it is the Germans who will probably stand in the way of their getting it. It is not perhaps to be wondered at, therefore, that in Russia this magnificent and cordial reception of the German EMPEROR is looked on as somewhat of a piece of Court show, in which good Russians may properly take part to please their CZAR, but which no one is to misinterpret into an indication of love for the German EMPEROR or his subjects.

MR. STANSFELD'S PROPOSALS.

EITHER Mr. STANSFELD is more prudent than his predecessor, or the Government has learned wisdom from experience. Two years ago Mr. GOSCHEN, having previously paved the way by a pamphlet in the form of the Report of a Committee, introduced an ambitious, and in some respects mischievous, measure which excited much uneasiness. The owners of landed property could not but perceive that the Bill was framed in a hostile spirit; and if they had not themselves discerned the tendency of Mr. GOSCHEN'S proposals, they would have been enlightened by the applause which sentimental professors of newfangled theories about land bestowed on a measure which they declared to be a just attack on the squires. More impartial critics doubted whether it was just or expedient to frame systems of finance for the sake of punishing any class of the community. Mr. GOSCHEN himself, and Mr. GLADSTONE, more than once intimated in a sneering tone their intention of relieving the grievances of the ratepayers at the expense of those who had promoted the agitation. Further reflection has perhaps suggested a doubt whether a general transfer of liability to local burdens would be possible, although Mr. GOSCHEN'S measure would in a large number of cases have caused serious hardship. An accidental coincidence is still more likely to have checked the enthusiasm of the Government. On the same night on which Mr. GOSCHEN moved for leave to introduce his Local Government Bill, Mr. BRUCE expounded his ill-fated project for ruining a class more powerful than small landowners. The licensed victuallers at once merged all political differences in a combined and unanimous hostility to the authors of the Beer Bill, and they have since convinced friends and enemies that they were not to be threatened with impunity. The Durham election which occurred two or three weeks afterwards provided them with the first fruits of their revenge; and it would seem from the result of the contest at Bath in the present week that their wrath is not yet appeased. The Irish clergy had no electoral influence, and the Irish landlords were either powerless or opposed to the Government; but the publicans command many votes in every borough in the kingdom. Mr. GLADSTONE and his colleagues by this time understand that men sometimes prefer their own interests to the most sublime considerations of public morality. Mr. GOSCHEN'S Bill, though it was a less hazardous experiment on the part of its promoters, necessarily offended and irritated the landowners against whom it was directed; and the occupiers, who have often reasons for not wishing to disturb existing relations, have shown but little eagerness to accept the proffered bribe. Some of the provisions of the Bill were obviously impracticable, and the plan of retaining or reviving the parish as the unit of local administration was generally disapproved. The Bill of 1871 was summarily dropped, and in the last Session no similar plan was proposed; but the Government is still pledged to deal with the whole subject of local government and taxation, and the majority obtained by Sir MASSEY LOPES rendered it impossible to postpone some scheme of readjustment.

No objection can be raised to Mr. STANSFELD'S division of a task which could not prudently have been completed or undertaken in a single year. The Government still professes to intend that some contribution shall be made from the national revenue to the relief of local burdens; but Mr. LOWE announced in his speech on Mr. SMITH'S motion that it was impossible to arrange the form or amount of the payment until the position of the recipient bodies was more fully ascertained. No similar scruple had prevented the offer of 1871 to surrender the house-tax for the benefit of the ratepayers; but perhaps the Government may anticipate a change in the opinion of the House of Commons. During the two or three years which must elapse before any measure of the kind can be proposed, it is possible that the ratepayers may become less urgent in their demands. The preliminary question of local government is neither simple nor easy, though Mr. STANSFELD, like Mr. GOSCHEN, is probably prepared with a plan to be considered by a Select Committee. Mr. GOSCHEN'S Committee of 1870 was appointed at a time when the influence of the Government over the Liberal party was at its highest; and, as the result proved, the Chairman was justified in reckoning on the implicit obedience of his docile majority of nominees. On every important question a strict party division resulted in the victory of the Government, which had, according to an odd but recognized custom, a majority of one. Mr. GOSCHEN'S Report, which was opposed by every Conservative member of the Committee, might as well have been produced in the shape of a pamphlet or a Bill, without the idle form of reference to a Committee. Mr. STANSFELD'S proposals will perhaps be more independently discussed; nor, indeed, is he himself known to have, like Mr. GOSCHEN, arranged the principles and details of a measure beforehand. He has not explained whether he adopts the plan of dividing the burden of the rates between owners and occupiers. It is now generally admitted that there is a distinction in the incidence of local taxation as it respectively affects land or houses; but whether the owner or the occupier is at present chiefly taxed, any plan of readjustment ought to be narrowly watched. As Mr. FAWCETT shows in an article in the current number of the *Fortnightly Review*, it is necessary in determining the question to distinguish between places where the quantity of building land is practically unlimited and especially eligible situations such as the heart of the City of London. Wherever rates practically fall, either in whole or in part, on the owner, he has no relief to expect. There are sufficient reasons against any plan for diminishing the special burdens on land; but it is a novel and questionable theory that a tax, if it only lasts long enough, becomes a charge upon property in favour of the State. The liability of landowners or other taxpayers is not to supply a certain annual revenue, but to provide for necessary expenses which might possibly be diminished, or even in some instances abolished, with the effect of relieving the ratepayers.

The removal of exemptions, which is the principal object of Mr. GOSCHEN'S Bill, although it will operate injuriously to certain kinds of property, cannot be reasonably resisted in principle. The State sets an example of self-denial, and provides an instalment of relief to ratepayers by surrendering its immunity in respect of public buildings and other property of the kind. The rates which are paid on a Post Office will, in accordance with Sir MASSEY LOPES'S demand, be

contributed by the general taxpayer. In some places, as in Westminster and in the towns which contain dockyards or arsenals, the share of rates paid by the Government will be not inconsiderable. The extreme gratification which is derived from taxing a visitor or an alien has been illustrated by the constant attempts of parishes and unions to extort from the railways which traverse their districts the largest possible amount of contribution. No effort will be spared to assess Government property at the highest possible amount. The extension of the rate on coal-pits to metal-bearing mines has often before been proposed, and a rate on the value of land for sporting is defensible as far as the shooting has a money value. The provisions of the Bill will nevertheless in many cases work injustice, unless they are carefully framed. Many owners of land, though they retain the right of sporting, take little or no trouble to preserve game; and perhaps they scarcely kill as much in the year as would cover the wages of the keeper and the cost of powder and shot. Their liability to be rated ought to be measured by the price which a tenant would pay for the shooting if the same head of game were maintained. It would perhaps be easy by a system of strict preserving to keep ten times the actual head of game on the land; and a zealous preserver might be willing to pay a high rent for a tract of land now bare of game, with the intention of turning it into a poultry-yard of pheasants. If the Bill is equitably framed, the rate ought to be regulated by the quantity of game annually killed. Every keeper can return the numbers with the strictest precision, and for his own sake he will not be inclined to curtail the return. The proposed increase of valuation of country houses is more plausible than just. All other property is rateable according to the actual or possible income which it would produce to the owner, but a large house in the country, unless it is so situated that it would be likely to find a tenant, is a cause of expense and not of profit. Mr. STANSFELD has not professedly adopted Mr. GOSCHEN'S iniquitous proposal of taxing mansions on the estimated cost of building. The needy owner of an ancient castle which could not be built for a hundred times his actual income might be ruined if a house were rated on the interest of the supposed cost of construction. If the rate, on the other hand, depends on the saleable value, it will be found that houses on large estates are in many cases thrown into the bargain by the vendors. In this and in other cases a just valuation is the first condition of a fair system of rating.

BATH AND GLOUCESTER ELECTIONS.

THE success at Bath and Gloucester is sufficient to inspire the Conservatives with great immediate satisfaction, and with no slight confidence as to their prospects at the next general election. They are important towns; the constituent bodies are of a varied character; the members whose death or retirement has created the vacancy have been respectable Liberals of a safe and sound kind, not likely to have excited any special opposition by their political career; and altogether there could scarcely have been found two better places to test what is the real amount of increasing strength that the Conservatives have acquired. These are exactly the kind of Conservative victories that make Liberal sitting members quake in their shoes; for they seem to make unsafe those delightful Liberal seats which are not dependent on the fancies, the prejudices, or the fanaticism of immense electoral bodies. At the bottom of the Conservative triumph lies no doubt the fact that political opinion runs now almost entirely in one groove—that of moderate Liberalism—and that many moderate Liberals incline to think that they can be more sure that the Conservative section of their party will be Liberal than that the Liberal section will be moderate. This cannot be called a Conservative reaction, for it is not a reaction at all, but it leads many persons with no strong political bias to give votes to Conservative candidates. Then again the Ballot is almost sure to act favourably to a Conservative candidate seeking to win a Liberal seat under such circumstances. An elector of Bath who read the addresses and speeches of Lord CHELSEA and Mr. MUNCH would have noticed that no real difference of opinion divided the candidates. In fact, the only serious dispute between them appears to have been as to which of the two was entitled to the credit of having first adopted the bright idea of moving for the total abolition of the Income-tax. If a Liberal elector was inclined to think that of these two moderate Liberals he would feel the more comfortable with Lord CHELSEA, it was a much less difficult step for him to separate himself from his party under the Ballot than it would have been if open voting had been in force, and his neighbours and friends could have made unpleasant remarks on his defection. This is a very serious consideration for many sitting Liberal members, and no doubt will co-operate with many other causes in making them desirous above all things that the dissolution shall be put off till next year. It is still doubtful whether the dissolution will be postponed beyond the autumn; but, if it is postponed, its postponement may be chiefly regarded as the reward which the Ministry will give to a number of staunch and zealous supporters who have no chance of re-election, or who feel that their chances are small, and claim that, in return for the enthusiastic aid they gave to the Government in its days of glory, they should now have one more short year added to the span of their Parliamentary life.

There is no reason to dispute that these two elections have some significance as to party prospects generally, but it is at least singularly instructive to turn to the details of local history that preceded them, and to learn what actually happened that may have had a practical bearing on the result. At Bath there was plenty of that pressure put on the candidates, both by the Permissive Bill agitators and by the publicans, which the House of Commons deplored with so much feeling and candour on Wednesday. Lord CHELSEA took a decided line, and said that he would vote against the Permissive Bill, and pointed out that if he was returned on the Tuesday he might be in time to vote against it in the House of Commons on the Wednesday, which he actually did, so that he was naturally the publicans' man. Mr. MUNCH, on the other hand, declared that, if elected, he would neither vote for the Bill nor against it. This lost him the publicans without gaining him the Permissive Bill agitators. The unblushing mode in which both these sets of people determined to make the whole election depend on concurrence with their special views could not have been better illustrated than by what took place at their respective meetings after the views of the candidates became known. At the meeting of the Licensed Victuallers the Chairman began by announcing the cheering fact that their Association had over a hundred members, and the next step was to decide which way the whole set of them should vote. The first speaker said that Mr. MUNCH was an excellent man, but that "he objected to "him because he was rather against their trade to a certain "extent than he was for it"; a view of political duties and responsibilities which wakened the audience to applause. He was followed by a bold tavernkeeper who urged that it was not with the politics of Lord CHELSEA or Mr. MUNCH that they were concerned. In every other respect Mr. MUNCH was deserving of the respect and the good will of the citizens of Bath, but he was halting between two opinions, and that would not do. Accordingly a resolution was proposed and was seconded by a person who avowed himself to be a Liberal, that all sections of the trade should be invited to vote for Lord CHELSEA. After this had been carried, a member of the Executive Council said that the voice of the publicans in the Bath election would have an immense influence on other constituencies at the next general election, and we are inclined to think he was right. On the other hand, the Permissive Bill people had their meeting, and they decided not to support Mr. MUNCH. They adopted a resolution to the effect that his merely promising not to vote against their Bill did not "evoke enthusiasm or a desire to work for "Mr. MUNCH," and the principal speaker announced that "if a party could win without them, it must be a very strong "party indeed, and if it could not, then that party knew "how to get their aid." In other words, the Permissive Bill supporters determined that Lord CHELSEA, who was entirely against them, should get in rather than that Mr. MUNCH, who was at least neutral and more friendly than not to them, should get in. And these are good electioneering tactics, for the great thing with these people is to get their support bought at elections; and the way to convince a candidate who may be elsewhere in Mr. MUNCH'S position that they are worth buying, was evidently to show that he would lose if he did not pledge himself to obey their dictation on condition of being returned by them. The majority for Lord CHELSEA was 260, and the abstention of the Permissive Bill people and the unanimity of the publicans' go a long way to account for a majority of this number.

Bath returned a Conservative in the last Parliament, and for this Parliament returned two Liberals by a majority that was not very large. But Gloucester returned two Liberals for the last Parliament, and sent two Liberals to this Parliament by a majority of 400; and it is therefore a great

triumph for the Conservatives to have wrested a seat at Gloucester from their opponents. Here, again, the inevitable beer question seems to have had much to do with the result. The contest in part turned on questions of a curiously local character; the Liberal candidate averring that he paid his men higher wages than his adversary did, and the Conservative candidate retorting that he had more ships than his enemy had. But these minutiæ were drowned in the beer. Most fortunately for Mr. WAIT, who is now the Conservative member, his friends were able to appeal to a letter he had written some time ago, enclosing a cheque for a Licensed Victuallers' Asylum, which proved that he was at heart a friend of the publicans, and that it was not merely in order to get a seat in Parliament that he simulated sympathy with their cause. This judicious benefaction, and the hearty support he was prepared to give to amendments such as the publicans desire to see made in the Act of last year, turned the scales in his favour; and at a meeting of his supporters, held on the eve of the polling day, he had the satisfaction of announcing that he had just had put into his hands a copy of a resolution at which the publicans had unanimously arrived, and which was to the effect that of the two candidates the publicans pronounced him to be the more favourable to the interests of the trade, and would therefore all vote for him. The publicans have, in short, shown by the Bath and Gloucester elections that they can do much more to affect the result of an election than their opponents can do, and that they mean to do all they can. As a general rule, it will be more easy and natural to Conservatives than to Liberals to fall in with the mode of viewing social matters which commends itself to the publicans. The Conservatives, as a rule, are less likely to have run off into any of the grooves in which the energy of sentimental philanthropy expends itself. Lord CHELSEA had no hesitation, when asked about the Contagious Diseases Acts, in replying that he thought their object was an excellent one, and that they ought to be upheld. It is wrong that such minute matters as the Licensing Act and the Contagious Diseases Acts should be made the sole turning-point on which the election of a person to take charge of the interests of a great Empire depends; but if folly and narrow passions make them such turning-points, it must be a comfort to be able to vote for a candidate who laughs at the humiliating farce of the Permissive Bill, and scorns the indecent agitation on the other question. But it must be said, in justice to the constituencies, that if they now allow elections to turn on such very trifling matters, and submit to the whims of cliques, this is in a great measure due to accidental and temporary causes. There is no subject of general political interest now to enliven and divide the electoral bodies. How complete the lull in politics is may be gathered from the fact that the Liberal candidate at Bath had to promise not to support Mr. MIALL, and announced that he was entirely against the extension of the franchise to agricultural labourers. When thus the platform of both parties is made virtually the same, each fraction of the voters thinks not unnaturally of itself and its own interests and grievances; and the Conservative candidate at Gloucester had to please his working-men friends by engaging to support an alteration of the Masters and Servants Act which would place masters and servants on an equality, and, when he got among porters and pointsmen, he pledged himself, if elected, to endeavour, by some means which he did not specify, to reduce the hours of railway labour. Here, again, we do not see why there should be any difference between Liberal and Conservative candidates. What one can safely and honestly promise the other can promise; so that really the chief distinction between the two parties as regards the forecast of their electioneering prospects seems to be that the beer interest has concluded that the Conservatives are the most to be trusted, and that the beer interest has shown itself to be very powerful.

FRENCH PROSPECTS.

IT is hard to say whether the prolonged holiday of the Assembly is in the present state of French affairs an advantage or an inconvenience. Had the Assembly been sitting at the moment of the Paris election, the terror of the majority would probably have found expression in some wild proposal to extinguish Radicalism by giving the Radicals a genuine reason for their political existence; and as suggestions of this kind usually cause far more excitement than the chance of their being adopted justifies, the tranquillity of the country is so far furthered by the absence of the deputies from Versailles. On the other hand, the agitation to which the Conservative party in France is at present a prey may become more intense by suppression. When the recess is over the majority in the Assembly will have to put their fears into words, and it sometimes happens that the mere effort to do this exercises a calming influence upon the patient. The symptoms do not seem quite so alarming when they are frankly stated as they did when they were nursed in secrecy. When Conservative leaders are forced to affix a precise value to the return of M. BARODET for Paris, they may insensibly be led to confess that the fact that the capital has made good its traditional reputation by returning a Radical deputy need not altogether undo the work of the last two years. It is disappointing no doubt to find that even a Republic does not gain acceptance in Paris if it has the epithet Conservative tacked on to it; but the attitude of the Conservative party towards this particular constituency goes some way towards accounting for the unpopularity which attaches to the name. The element in the population which would ordinarily be most opposed to revolutionary projects has been rendered tolerant of them by the folly of the Conservatives in treating the return of the Assembly to Paris as a typically Radical measure. The Paris shopkeepers may naturally argue that the worst evil that can befall them under a Radical Government is the loss of business, and that as they are already exposed to this by the hostility of the Conservatives, they may as well try whether their luck may not be improved by giving the cards another shuffle. That the Conservatives will admit that they have made a blunder in thus alienating their hereditary allies is not to be expected; but they may at least come to recognize that this alienation is only an unavoidable drawback to the policy they have deliberately adopted. If they can be brought to see this, they may cease to regard the recent election as the exceptional and inexplicable horror which they now esteem it.

Unfortunately the absence of justification for excitement does not involve the absence of excitement. Though there may be no sufficient reason why the feeling of the country should have been changed by the return of M. BARODET, it may have been changed notwithstanding. As yet there are no data forthcoming on which to found a conclusion as to this point. The language of the Conservative deputies is reported to be extremely violent; but the peculiarity of French politics for some time past has been that the Conservative deputies do not represent the Conservative electors. The two may have been brought into harmony by the unexpected exhibition of Radical strength in Paris, but there is no present ground for thinking that this change has taken place. The Conservative deputies are coming back to Versailles in an exceedingly embittered frame of mind; but it is at least possible that this may result from the discovery that their constituents are not so much alarmed as themselves, and are consequently so much the less likely to return them at the general election, and so much the more likely to support M. THIERS in the interval before the general election. It would be unsafe to assume that this is the cause, because it is also possible that the violent counsels attributed to the Conservative leaders may proceed from the conviction that they may now for the first time count upon the co-operation of the country in giving effect to them. The fact that the provincial elections have all gone in favour of Republicans of various shades does not of itself disprove this, both because the elections were held on the same day as the Paris election, and because the Conservative electors are wont to evince alarm, not so much by voting for a candidate of their own way of thinking as by abstaining from voting altogether. Nor is it easy even to speculate with any assurance on what is going on in their minds. They have lately shown a wholly unexpected amount of common sense in relation to politics, and the wonderful success with which M. THIERS has governed France is mainly due to this fact. But then they may have attached a disproportionate value to the apparent acquiescence of Paris in M. THIERS's rule, and the rejection of his FOREIGN MINISTER by the Parisians may create an equally unexpected distrust of M. THIERS's power to go on governing. In this case the power of the extreme section of the party will be greatly increased. They, at all events, know what they want, and will undertake, if they are given what they ask, to ensure the maintenance of order. If the moderate Conservatives no longer feel their old faith in the Government, they will be likely to listen to these assurances from sheer despair of attaining safety by less desperate counsels.

For more than two years M. THIERS has steadily endeavoured to form a Republic by the hands of the Conservatives instead of, as on all former occasions, by the hands of the Radicals. The main obstacle which he has had to encounter

in this undertaking has been the unwillingness of the Conservatives in the Assembly to be employed for such a purpose. Hitherto this unwillingness has been balanced by the readiness of the Conservatives out of doors to support the Government. The Assembly has done as much as it dared to thwart M. THIERS, but whenever things have come to a crisis it has shrunk from placing itself in open antagonism to its constituents. It may be that opposition to M. THIERS would no longer involve it in this open antagonism. It may be that the Assembly thinks that opposition to M. THIERS would no longer have this effect, though its reasons for thinking so are insufficient. Either way the danger of a collision between the Executive and the Legislature would be greatly increased. M. THIERS is pledged to bring in Bills which, if framed in a Republican sense, can hardly fail to be exceedingly distasteful to an Assembly in which the majority are Monarchists at heart. If these Bills are rejected, M. THIERS will be placed once more in the dilemma in which he found himself last autumn. Either he must take his orders from an Assembly with which he is not in accord, which would be to sacrifice his influence in the country; or he must resign his office, and thereby abandon France to the civil strife which would probably accompany any attempt to bring about a Restoration, whether in name or in fact; or he must appeal to the country to judge between him and the Assembly, and to declare which of the two it prefers. If he should be reduced to this choice of evils, the ill effects of the Radical policy in preferring M. BARODET to M. DE RÉMUSAT would become terribly apparent. It is essential to M. THIERS's success in the very difficult enterprise in which he is engaged that he should feel entire confidence in the support of the country. Nothing short of this can give his policy the necessary certainty and decision. There are not wanting symptoms that M. THIERS no longer feels this entire confidence in the support of the country; that he, like other people, is unable to pronounce on the instant whether the effect of the Paris election has or has not been to alienate the provincial Conservatives, who have up to this time stood his staunch friends. Unless his reliance on the country is speedily restored, his hold on the country can hardly be maintained. To all appearance, the hope that the Assembly will be wise in time grows fainter every day. Little can be looked for when the Session begins again except a renewal of the attempt to force M. THIERS into a line of action which would create an incurable breach between him and the Republican party. If he shows any want of resolution in resisting this attempt, it is certain to be prosecuted with increased vigour, because its authors will be proportionately assured that in the end his resistance will be overborne. M. THIERS will thus be reduced to make his choice between absolute submission to the Assembly and open repudiation of its claim to represent the country; and if he really entertains a suspicion that this claim, since the Paris election, has become less ill founded than he has heretofore held it to be, he may have no option but to accept the former alternative. There is another element in the calculation which must not be left altogether out of sight. Very little is known in England of the political temper of the French army, or of the line which Marshal MAC-MAHON would take in the event of an open conflict between the PRESIDENT and the Assembly. Both the troops and their commander may be devoted to the PRESIDENT, and in that case the Assembly would think twice before essaying a Conservative *coup d'état*. But their devotion to the Assembly may turn out to be greater than their devotion to M. THIERS, and in that case the Assembly might defy M. THIERS to hasten its dissolution even by a day. If the country were clearly on the side of the PRESIDENT, even the assurance of being supported by the army might fail to nerve the Assembly to adopt so bold a policy. But if M. BARODET's return has really wrought a change in this respect, the prospect of the Assembly's having recourse to some violent measure may be less remote than its previous irresolution would lead the world to imagine.

SIR CHARLES DILKE'S MOTION.

MR. GLADSTONE'S speech on Sir C. DILKE's motion proved that, among his many oratorical gifts, he is capable of succeeding in a style which he has not habitually cultivated. It would have been impossible to enumerate more skilfully all the commonplaces which serve as arguments, and sometimes as very good arguments, against troublesome proposals. The question of redistributing electoral power is complicated and difficult; it cannot advantageously be considered in the second half of the Session; other important measures demand the attention of Parliament; and finally the PRIME MINISTER expresses a well-founded confidence that the House will reject the motion by a decisive majority. In former times Sir ROBERT PEEL and Lord PALMERSTON excelled in the art of abstaining, under cover of conventional phrases, from binding themselves by superfluous pledges. Mr. GLADSTONE is ordinarily more candid and more impulsive than his predecessors; but it is satisfactory to find that on occasion he also can get rid of an inconvenient resolution without enouncing any general principle. His speech was quite as good an answer as the motion deserved; and the House must have heard with a feeling of relief that Mr. GLADSTONE also could be prudent and deliberately dull. It is not impossible that the present generation may witness the accomplishment of Sir C. DILKE's ulterior designs, to which an equalization of electoral power would effectively contribute. The meaning of all schemes of the kind is to transfer political power to the poorest class, which forms the numerical majority of the population, or rather to the demagogues who would govern through the aid and in the name of the multitude. The Friends of the People, finding themselves unable to command the confidence of their equals, hope to suppress personal independence by appealing exclusively to the homogeneous masses. Those who hold that almost any method of selecting rulers is better than universal suffrage, take little interest in the various proposals which are devised for the coercion of the intelligent minority. If Sir C. DILKE, and other reformers of the same kind, are strong enough to remodel the Constitution, they will sooner or later create equal electoral districts, as a step to the establishment of a Republic. In the meantime they address to an Assembly which has no sympathy with their opinions ostensible arguments which can have no influence on the opponents of revolutionary measures. It is but an idle amusement to collect statistics for the purpose of proving the notorious fact that some constituencies are several times larger than others. Small boroughs have been quite as judicious as large towns in the discharge of their electoral duties. Sir R. PEEL sat for Tamworth, Lord PALMERSTON for Tiverton, and Sir ROUNDELL PALMER for the borough of Richmond. Mr. LOWE found refuge at Calne from the intolerant violence of Kidderminster. He now represents the only constituency in England which would four or five years ago have been sufficiently intelligent and independent to select a man of great ability, who as a Liberal had no claim on Conservative electors, while he had given the deepest offence to the advocates of democracy. With perfect consistency Sir C. DILKE proposes to disfranchise the Universities, suggesting that Mr. HARDY and Dr. LYON PLAYFAIR might easily find seats elsewhere. Mr. HARDY, till he was elected for Oxford, represented the borough of Leominster, which then returned two members to Parliament. It is uncertain whether he would find a vacant seat if he were to retire from Oxford; and of Dr. PLAYFAIR it is enough to say that the academic constituency which he represents was the first to discover his merits.

The theorists who with good reason desire to secure the representation of minorities would, if they looked around them, find that their object is already in some degree attained through the unequal distribution of electoral power. All parties, and nearly all interests, are represented in the House of Commons, although a Conservative in Scotland or in Birmingham is as incapable of influencing an election as if he were a Radical candidate for an old-fashioned county. Mr. COLLINS was willing to accept Sir C. DILKE's proposal, on condition that the new and artificial contrivance of a cumulative vote should be imposed as a condition of the equalization of the franchise. A Parliament elected by labourers and artisans would make short work of any arrangement which interfered with the predominance of numbers. Even if it were admitted that the elaborate devices of modern projectors produced a just system of representation, no institution is worth much which exists, if it exists at all, at the mercy of those who have an interest in overthrowing it. It is not worth while to dwell on the anomalies which are found inseparable from the most ingenious systems of cumulative voting. The fatal defect of intrinsic weakness is a sufficient condemnation of the theory. Mr. BRIGHT never more thoroughly represented the democratic instinct than when he denounced with passionate indignation the experiment which seemed likely to endanger the supremacy of his party at Birmingham. Whatever may be the opinion of a few speculative Radicals, the genuine supporters of popular suffrage desire exclusively to promote the political interests

of the most numerous class. They are on their own principles perfectly right in objecting to measures which would practically withdraw from them an ostensible concession. Systems of the kind have been tried on a small scale in some parts of the United States where probably little interest is taken in political matters; but the deepest conviction of American Republicans is that the majority is practically supreme, if not theoretically infallible. There is no reason why Liberals should not amuse their leisure with devising schemes for teaching Leviathan to go in harness; but Conservatives such as Mr. COLLINS will find it safer to retain what is left of the old institutions which still give them a share of power. A professed Republican who proposes a fundamental change in the representative system is not likely to consult the welfare of monarchy, or of the numerous feelings and interests which find a symbol in the Crown. It is satisfactory to find that for the present Mr. GLADSTONE is not prepared to admit universal flesh and blood to the enjoyment of the franchise.

There is some reason to hope that the House of Commons will deal as summarily with Mr. TREVELYAN'S proposal as with Sir C. DILKE'S. The extension of household suffrage to counties would render the franchise uniform; and it is easy to see that electoral districts would be equalized when there was no longer any distinction between different constituencies. It matters little on what pretext a mischievous project may be rejected. It is now the fashion to object to the transfer of political power to farm-labourers on the ground that they are ignorant, although it is by no means certain that they might not become more formidable if they were as well educated as the artisans of the towns. Privileges and disqualifications are, within certain limits, valuable securities of order and freedom. The extreme faction which now forms a small and active minority in the House of Commons not unnaturally endeavours to strengthen itself by readjusting the constituencies in such a manner as to increase the numbers of the party. The representatives of the labourers in the counties would support Sir C. DILKE; and the members for equal electoral districts would vote with Mr. TREVELYAN. It is useless to remonstrate with ambitious politicians who perfectly understand the means by which their own objects would be most effectually promoted. With those who prefer good government to symmetry, arguments deduced from any supposed right to the franchise have but little weight. It is possible that, if demands for the extension or equalization of the franchise can be adjourned for a few years, the example of foreign and colonial communities may enlighten general opinion on the merits of democracy. In the United States the effects of universal suffrage may be traced rather in the prevailing corruption than in anarchy or violence. The Australian colonies have not tried the experiment as long; but their Parliamentary success is not brilliant nor encouraging. On the Continent of Europe universal suffrage, though it is regarded in theory as the great security for freedom and equality, commands no respect from democrats. Any Assembly which, having been elected by the whole community, ventures to oppose the caprices of the mob is immediately accused of treachery or usurpation. No equalization of electoral districts would have induced the rabble of Madrid to abstain from menacing the Permanent Committee of the Cortes. The sovereign people, after delegating their power to their favourite nominees, commonly reserve the right of exercising their absolute power in their own persons. French demagogues have always frankly professed their contempt for any representative body which might hesitate in its attachment to the Republic. The only Parliament which has thus far succeeded in asserting and administering supreme power is the English House of Commons, which has at present not been chosen by constituencies regularly divided into equal electoral districts.

JUDICIAL PEERAGES.

LORD SALISBURY, who has often expressed dissatisfaction with the present condition of the House of Lords, probably proposed his amendment to the Judicature Bill for the admission of Judges of Appeal to the peerage rather for the purpose of keeping the controversy open than in the expectation that his proposal would be adopted by the House. The mover himself was perhaps not even prepared to acquiesce in the immediate acceptance of his own project; for, although Lord GRANVILLE expressed but a faint objection to the plan, while Lord GREY gave it cordial support, Lord SALISBURY of his own accord withdrew the amendment. If at any future time it is thought expedient to attach peerages to judicial offices, a slight alteration would render Lord SALISBURY'S plan less objectionable. There would be no inconvenience in allowing judicial peers to retain their seats for life, when, through the effects of age or infirmity, they had ceased to sit in the Court of Appeal. It is true that bishops who have under the provisions of modern Acts resigned their sees cease to sit in the House of Lords, and that the prelates of the Irish Church have, since the suppression of the Establishment, been reduced to a private condition; but, according to constitutional theory, the spiritual peers are an Estate of the Realm, and consequently they must be actual incumbents of their respective sees. A more practical reason for construing their Parliamentary claims strictly is that modern opinion or prejudice barely tolerates the presence of bishops in the House of Lords, and is entirely opposed to any increase of their number. The only members of the House who have but a temporary tenure of their seats are the anomalous representatives of the Scotch and Irish peerages. If the presence of the Judges of Appeal in the House of Lords is desirable, they might still make themselves useful after their retirement from office, except that they would in the majority of cases be so far advanced in life that their retention of their seats would at the worst be harmless. Lord GRANVILLE raised the plausible objection that there would be an inconvenience in listening to twenty-one professional speeches on every debate on legal questions; but the law lords who at present discuss legal matters with little assistance from laymen would be the principal sufferers by a large addition to their number. The argument was perhaps good enough to be urged against a tentative motion which was not seriously pressed. Graver reasons for hesitation may be found in the risk which attends any disturbance of an institution which depends in a great measure for existence on its great antiquity.

The jealousy which has been traditionally felt against the combination of judicial and political functions was not noticed in the short conversation on Lord SALISBURY'S amendment. It is highly desirable that the Lord Chancellor should be a member of the Cabinet, and that the same person in his turn should have influence in the councils of the Opposition. The Master of the Rolls may still legally sit in the House of Commons, but it is perhaps fortunate that he can seldom find a constituency. Forty years ago the great object of BROUGHAM'S ambition was to retain his seat for Yorkshire in conjunction with the Mastership of the Rolls; but it was fortunate for his party, and perhaps for himself, that his aspirations were disappointed. It is not at all certain that respect for judicial impartiality might not be impaired if half-a-dozen of the Judges of Appeal happened to take an active part in Parliamentary conflicts. Lord SALISBURY, in proposing to confer upon them a novel and qualified kind of peerage, seems to have assumed that they would content themselves with the modest function of acting as legal assessors to the House of Lords. In deference to the same modern etiquette which prescribes to the clergy a feminine narrowness of decorum, the bishops are now expected to affect indifference or ignorance during ordinary discussions of public interest. A body of elderly lawyers, conscious of knowledge and ability, might perhaps assert their right, as long as they occupied seats in the House of Lords, to take an active part in its general business. It is true that, as Lord SALISBURY and Lord GRANVILLE declared, Governments would scarcely pack the House with partisan judges as unscrupulously as if they were life peers without any special qualification; but some legal promotions are always made on political grounds, and there is nothing to prevent lawyers from being also politicians. The official peers would be as competent to judge of political and legislative questions as their hereditary colleagues; but the popularity or unpopularity which they might possibly acquire would be equally injurious to their position as judges. The difficulty would not be insuperable if there were sufficient reasons for introducing a considerable number of judges into the House of Lords; but, if the measure is ever seriously proposed, the objection would require mature consideration. Every successive scheme for altering the condition of the House of Lords illustrates the complicated nature of the problem.

Lord GRANVILLE took occasion to repeat an opinion which he has frequently expressed, that the House of Lords committed an error in rejecting the claim of a life peer to sit in the House. It is not worth while to discuss at length a hackneyed controversy. A great change in the Constitution, even if it can be shown to be the revival of an antiquarian practice, ought not to be effected at the discretion or caprice of any Minister. The arguments for or against life peerages have little connexion with the failure of Lord CRANWORTH'S rash experiment. The discussion on Lord RUSSELL'S motion of three or four years ago tended to dispel some common illu-

sions. It was found, on investigating the claims of different classes of supposed candidates for a life peerage, that in the majority of cases the honour would be reserved for mediocrity. On that occasion Lord SALISBURY suggested that life peerages might be conferred on great merchants or manufacturers, who would by the nature of the case have acquired ample fortunes. It is after all probable that some useful members might be added to the House of Lords if the choice of peers were not partially limited by the necessity of endowing an hereditary title; but there would be some risk of creating an inferior caste in an Assembly which has always more or less carefully asserted the equality of its members. The profound belief of the peers themselves in the superiority of birth to merit is indicated by their successful persistence in compelling the bishops to appear in ridiculous costumes. Long ago all peers wore their robes in the House of Lords; and when, in common with the rest of the world, the lay peers disused their official uniform, they insisted that the bishops should continue to proclaim to all spectators their strictly professional position. In prizing their own hereditary character the peers display a sound instinct; for rank, and the training and habits which it implies, account in a great degree for the deference which in England is still paid to the aristocratic Assembly. With few and insignificant exceptions, a peerage affords a sufficient guarantee that its incumbent is a gentleman; and among five hundred cultivated men of high social station, it is always found that a sufficient number of statesmen and administrators is included. The average ability in the House of Lords is certainly not inferior to the House of Commons; and it is scarcely a misfortune that a great portion of the intelligence of the community is to be found outside of both Houses of Parliament.

One of Lord SALISBURY'S reasons for his proposal was founded on his wish to maintain in a new form the ancient connexion between the House of Lords and the Supreme Court of Appeal. In deference to general opinion and to expediency, and in some degree under the influence of Lord CAIRNS, the House of Lords has consented to abdicate its judicial functions, except that it will still receive appeals from Scotch and Irish Courts. There is no doubt that the sacrifice of a power which was only formal and nominal will in some degree detract from the authority of the House; but it seems a far-fetched contrivance to make judges into peers because peers have hitherto been judges. In early times the most indispensable condition of judicial authority was power; and when it was recognized that the necessary learning and experience were only to be found among lawyers, the House of Lords retained its jurisdiction by delegating its functions to Chancellors and other law lords. If the members of the Supreme Court of Appeal were to take their seats in the House of Lords, their judicial privileges would henceforth be confined to themselves, and would be exercised in a separate capacity. Lay peers have not claimed any share in ordination or consecration because they sit in the House by the side of the bishops. It is not worth their while to insist on retaining a fragment or a shadow of their former functions, although the Lord Mayor and Aldermen still impose on themselves the solemn duty of sitting mute by the side of the judges at the Old Bailey. If any new class of peers is to be invented, it must take its part in the general business of the House of Lords; and, as Lord GRANVILLE suggested, it would be anomalous to extend the privilege of peerage exclusively to a single profession. If high office is to be represented in the House of Lords, the Adjutant and Quartermaster-General, or the Admiral of the Channel Fleet, might be as fitly summoned as a Judge of Appeal; and probably the President of the College of Physicians would advance a similar claim. If there were a question of framing a new Constitution, there would be nothing absurd in preferring eminent public or professional functionaries to the heirs of great estates, or to the descendants of distinguished statesmen and lawyers; but the House of Lords exists because it has long existed; and that which exists is not a Senate of the heads of professions, but an hereditary Assembly of a peculiar and indeed unique character. Lord SALISBURY'S peers or Lord GRANVILLE'S would derive any lustre which might attach to their titles from association with a body of peers born in the purple.

THE DEBATE ON THE PERMISSIVE BILL.

THE debate on the Permissive Bill encourages the belief that the voice of common sense cannot be altogether drowned by clamour. The Alliance is spending its 100,000*l.* upon an agitation which tends to produce a counter alliance of moderate people against the Permissive Bill. The publicans ought to rejoice to hear that the leaders of the Alliance are not discouraged by the vote of the House of Commons on the Bill, but, on the contrary, that they regard that vote as a call to more vigorous and determined efforts. Violence on one side of a question always inclines cautious judgment towards the other side; and members of Parliament who may be puzzled by the intricacies of the licensing law will unhesitatingly resent the insolent dictation of the Alliance. There is not likely to be much more of the absurdity of voting for this Bill as a sort of general protest that something ought to be done by Parliament to suppress intemperance. Mr. BRUCE opposed the Bill on an estimate, which can hardly be disputed, of the consequences of its passing. He said that it would largely increase the responsibilities of the Home Secretary. There would be continual opposition to it; riots would have to be put down, and scandalous evasions of the law must either be punished or winked at by the Government. This may be taken as the opinion formed of the measure by the experienced officers of the department over which Mr. BRUCE presides. But indeed no authority is needed to support a conclusion which is manifest to ordinary intelligence. The peace of the country could not be preserved if attempts were made to enforce this Bill.

It was time that Mr. BERNAL OSBORNE intervened to raise a laugh out of this most tedious of all annual performances. The inquiry as to the origin of crime is obscure, and even if the opinion be correct that women cause crime in men, the Alliance would answer that drink perverts the women who cause crime in men. The opinion is entertained by many respectable gentlemen who speak on platforms that girls go astray through love of drink, and it may be assumed in favour of these worthy persons that they are not well acquainted with the subject on which they speak. But ordinary observation will teach us that the passion for drink hardly develops itself among men until they are nearer thirty than twenty years of age, and the same remark would apply still more forcibly to girls of eighteen, with whom the love of dress and of admiration are commonly the strongest motives. It is quite true that women of immoral life are often drunkards, but the inference that drink led to immorality would be fallacious. A curious book might be written upon the crimes of sober men, which, if less frequent, are more dangerous than those of drunkards. A sober man may be a libertine or a gambler, and forgeries and embezzlements have been frequently committed to supply the demands of women or of play. When human nature is in question SHAKSPEARE is a good authority, and we may remember that his great criminals, such as IAGO, MACBETH, and CLAUDIUS King of Denmark, are not drunkards. The professional thief in England is not a drunkard, for the best of reasons—that he could not succeed in his profession or any other unless he kept himself sober in the hours of work. When he enjoys the rewards of success, no doubt the best wine he can procure is one of them, but there are others to which he attaches at least equal value. The truth was neatly put by a speaker in the debate who said that it was not drunkenness that brought on crime, but crime or vice that brought on drunkenness. A good deal was said by Sir WILFRID LAWSON about the working classes, who, undeterred by a coalition between gentlemen and licensed victuallers, are to deal at the next election with the great evil of drunkenness. It is remarkable that the working-man seems to be capable of everything except keeping himself sober. He can deplore the abandoned condition of the nation to which he belongs, or of the town in which he lives, but he cannot in his own person give an example of the temperance which he urges upon his neighbours. With good intentions, he cannot pass an open public-house. "The poor man is now the powerful man," but he has no power over himself. This would be a melancholy picture if true, but the working-man is not quite so contemptible a creature as his friends represent. It is true that many gentlemen, or "swells," as Sir WILFRID LAWSON calls them, oppose this Bill, and they do so because they are magistrates and answerable for the tranquility of the districts in which they live. One of the speakers in the debate, being a Chairman of Quarter Sessions, was surely well qualified to deal with this point. He said that in all probability the attempt to put it into force would result in something little short of revolution. If this opinion is only partially correct, the annual debate upon this Bill is simply waste of time. Indeed it may be doubted whether the authors of the Bill have ever seriously considered what would be the result of passing it. They know that it will not pass; and even if it did pass, they would not be called upon to deal with consequent disturbances. It should be remembered that the in-

habitants of a town would not be the only persons interested in the application to it of this Bill. Suppose, for example, that it were applied to the town of Stratford-on-Avon, which has an interest for the whole English-speaking race. If an American or Australian comes to England, he inevitably finds his way to Stratford, and he probably eats and drinks there. But under the Bill drinking might be forbidden to him. Other places are great resorts of traders, and in various ways the public at large, and not merely the dwellers in a district, are concerned with its condition. Take the case of an assize town, or of a town selected for the meeting-place of an agricultural or other society having members in all parts of England. We might perhaps venture to add the case of a Church Congress. This may be rather a narrow ground on which to oppose the Bill; but if the objection is unanswerable, as we think it is, it is necessarily sufficient. Assume that which we deny—that a majority of ratepayers are entitled to bind the inhabitants of a district upon this question—still they are not entitled to bind the people of England who have an interest that travellers should find suitable accommodation in every town. But that which concerns the entire public can only be dealt with by Parliament, and no Bill is needed to give to Parliament the power of legislation.

By the help of statements and counter-statements we may hope gradually to arrive at the truth as to the working of prohibitory laws in those countries where they have been enacted. Mr. DALRYMPLE reported that in Philadelphia he was told that people were in favour of the Maine Liquor Law, but against its enforcement. He also said that at an hotel in Boston he had the choice of three hundred sorts of wine. Mr. DALRYMPLE'S statement is curiously confirmed by Mr. NEAL DOW, who supposes himself to be writing to the *Times* in correction or explanation of it. Mr. Dow says:—"Boston "is controlled by the vote of immigrants from Europe, and "the city Government represents the wishes of that class of "people upon the liquor question; but at no hotel in Boston "are any liquors or wines to be seen on sale; they are care-"fully kept out of sight." It appears, therefore, that Boston is part of a State which has enacted a prohibitory law, but in deference to the wishes of "a class of people" in Boston the law is not enforced. This shows what would be likely to happen in England under such a law. In deference to the wishes of a class of people capable of expressing these wishes emphatically the law would not be enforced. But then it is said that liquor is not "seen on sale" at hotels in decorous Boston; and we might add that even in debauched England it is the practice to keep wine in bin or cask until the customer requires it. The local knowledge which Mr. NEAL DOW possesses of Philadelphia seems to confirm Mr. DALRYMPLE'S story as to the Sunday walk of three or four miles which apparently brought him into a district for which a prohibitory law had been enacted, and where he was supplied with Philadelphia ale. The example of Boston naturally suggests that of London.. As long as we get up what are called International Exhibitions it may be assumed that we desire foreigners to visit London. But if we do desire this, we must allow foreigners to make themselves as comfortable as our climate and customs will allow. As things are, foreigners find themselves sufficiently miserable in London, and we can hardly contemplate to inflict upon them the further hardship of cutting off their drink. But indeed the notion of applying the Permissive Bill to London is too manifestly absurd to bear discussion. It is strange that the House of Commons should be compelled year after year to debate a measure that is so evidently unpractical. As Mr. BERNAL OSBORNE truly says, "There is nothing so "ridiculous that you may not get up a body of men to "propose it." There seems to have been a general desire in the House of Commons to give a quietus to this agitation, but we must pay the leaders of it the compliment of allowing that they are as nearly as can be irrepressible. The whole thing has become beyond expression tedious, and still the annual debate is held and reported, and discussed in articles, until everybody except the chiefs of the Alliance is weary alike of speaking, writing, or reading anything upon the subject. Mr. BRIGHT has influence on other subjects with the authors of this agitation, but the sensible letter which he has written on the Permissive Bill is likely to be as much wasted as reason and common sense usually are when addressed to enthusiasts. Sir WILFRID LAWSON of course says that the opponents of his Bill are fanatics, and we have heard of madmen who were convinced that all the world except themselves were mad. It is perhaps fortunate that Mr. DALRYMPLE has a hobby which he rides in vigorous opposition to the Permissive Bill. The authors of that Bill would lock up the drink, while he would lock up the drunkard. His proposal is perhaps the more absurd of the two, but he almost redeems his character for rationality by maintaining that the abuse of alcohol does not condemn its use. He collected information in America which the supporters of the Permissive Bill would find it difficult to answer. But they can easily disregard it. Sir WILFRID LAWSON says that he has felt the pulse of the working classes, and knows that they are enthusiastic upon this question. If they are not enthusiastic they could become so, and their enthusiasm might take a form which would oblige agitators to request the interference of the police. However, the division of last Wednesday guarantees the country against serious disturbance. Agitation for the Bill only expends ink. Agitation against a law founded on the Bill might easily produce bloodshed.

DEBTORS AND CHARITY.

THE ATTORNEY-GENERAL'S proposal to apply certain charitable trusts which were originally intended for the relief of "indigent persons imprisoned for debt in metropolitan "prisons" to the education of the children of convicts has given rise to a curious controversy as to whether there are not still some debtors to whom this relief may fairly be given. Vice-Chancellor BACON refused to sanction the scheme drawn up by the ATTORNEY-GENERAL on the ground that the object to which it was proposed to divert these funds did not come near enough to the original object for which they were left to satisfy the *cypres* doctrine, which has always been held in reverence in Chancery. When the object of a charitable endowment has utterly failed, it may be applied to quite a different object, as in the case of the old gift for the redemption of Christian captives in Barbary, which was ultimately used for the purpose of supporting and assisting charity schools in England and Wales. It is obvious that there is no sort of connexion between the ransom of kidnapped Christians and the education of charity children; but then there were no kidnapped Christians to be found in Barbary or anywhere else, and the Court of Chancery felt at liberty to bestow the money on any useful object that seemed to be in want of it. Before, however, the Court of Chancery will agree to such a transfer as this, it must be satisfied, not only that the original object of the charity has failed, but that no kindred object can be discovered. In the present instance Vice-Chancellor BACON held that it would surely be possible to find some other object more closely resembling the relief of imprisoned debtors than the education of convicts' children. He pointed out various objections to the ATTORNEY-GENERAL'S scheme in itself—as, for example, that it was not desirable that children should grow up under a public badge of criminal parentage, and also that provision for the education of children of this class was already made in the Industrial Schools; but the main ground of his decision was that the scheme did not comply sufficiently with the *cypres* principle. He declined to make any specific proposal of his own, but he suggested that the relief of the sick and poor would not be very remote from the original object of the funds in question. It does not appear that Sir JAMES BACON gave any countenance to the idea that there were poor debtors in existence of the class originally contemplated by the testators; but it has since been contended in the *Times* that, in point of fact, the original object of the funds has not entirely failed, and that debtors in need of relief are still to be found in prison just as in former days. This assertion will startle those who were under the impression that one of the principal objects of the last Bankruptcy Act was to abolish imprisonment for debt, and it is worth while to examine the grounds upon which it rests.

In order to understand the point at issue, it is necessary to observe what imprisonment for debt really implied at the period when these charities were established. A debtor was then liable to be put in prison for the most trivial debt, and kept there until he paid it or died. It did not in the least matter whether his default arose from poverty or contumacy. Imprisonment was regarded not merely as a means of enforcing payment, but as a proper punishment for having got into debt, and a creditor who could not obtain his money was entitled, if he chose, to take his revenge. There can be no doubt that many creditors grossly abused this power, and imprisonment for debt became a monstrous instrument of cruelty and oppression. The law made no allowance for honest intentions or inevitable misfortune; it did not ask whether the debtor could not or would not pay. It was enough that he did not pay; and for that he was handed over to the mercy of his creditor,

who could lock him up for years, and even for life, if, as was probable, he had no means to pay his debts. To complete the picture it is necessary to remember what sort of places prisons were in those days, and the terrible reality of the phrase "to rot in gaol." It is impossible to exaggerate the utter wretchedness, degradation, and hopelessness of a debtor in prison, without friends, without the means of sustenance for himself and his starving family except such as his hard creditor chose to allow him. Even in comparatively recent days, after the darker aspects of prison life had been reformed, the debtors' prison was still a scene of great misery and suffering. It will readily be understood that, under these circumstances, humane and tender-hearted people could hardly find a more natural or appropriate object for their benevolence than the relief of poor debtors shut up in prison. It is quite true that there is still imprisonment for debt; but there are not, or at least by law there ought not to be, any destitute debtors in prison. It would be more correct to say that the Bankruptcy Act abolished imprisonment for inability to pay debts than that it abolished imprisonment for debt. Debtors are still liable to be put in prison, but only on the ground that they are able to pay their debts and yet will not pay them. We are not aware on what authority the *Times* makes the assertion that destitute persons, and even paupers in receipt of parish relief, are now imprisoned for debt, but certainly nothing can be more contrary to the express directions of the law. The fourth clause of the Act for the abolition of imprisonment for debt sets forth that, with certain exceptions, no person shall be arrested or imprisoned for making default in payment of a sum of money. The exceptions relate to default in payment of a penalty or sum recoverable summarily before a justice of the peace, default by a trustee who has been ordered by a Court of Equity to pay any sum under his control, default by an attorney to make any payment ordered by a Court, and default in payment for the benefit of creditors of any portion of a salary or other income, as to the payment of which a judicial order has been made. In regard to small debts, it is enacted that a debtor may be imprisoned only where it is proved to the satisfaction of the Court that the person making default has, or has had since the date of the order or judgment, the means to pay the sum in respect of which he has made default, and has refused or neglected to pay the same. There can be no doubt, therefore, as to the meaning of the law. Whether the law is correctly interpreted in all cases is of course another question. If it can be shown that any judges of County Courts are in the habit of sending to prison destitute debtors, that may be a very good reason for calling for a more satisfactory administration of the law, but it is clear that the law itself is not to blame. It is perfectly certain that it is illegal to imprison debtors who are simply unable to pay their debts.

It is unnecessary to show how very different this is from the imprisonment of debtors under the old system. In point of fact, debtors are now imprisoned, not for inability to pay their debts, but for defrauding their creditors by refusing to pay debts when they have the means to pay them. It can hardly be seriously argued that people of this sort are a fit object for charitable relief. Just observe what would happen if this view were to be adopted. A man obtains and consumes a quantity of food and drink, and refuses, even when the debt has been proved against him, to pay for it. He is sent to prison, and at once becomes entitled to claim, as a reward for his misconduct, a gift of money from a charitable fund, to be spent, if he pleases, in further indulgence. If he had paid the bill, he would have been so much money out of pocket; as it is, he has not only succeeded in retaining the money due to his creditor, but has obtained a further sum as a premium on his dishonesty. It may be doubted whether, if this object of the law is to induce people to pay their debts, this object would be promoted by an arrangement of this kind. The *Times*, in a curious article in which the logic is all one way, and then by a sudden jerk the conclusion is twisted in an opposite direction, states the case very fairly. What, it asks, is to be done with a man who owes money, who can pay it, and does not choose to pay? The answer is—Let him go scot free, because "the great principles of modern "legislation are imperious," and because English people have got into the habit of boasting that imprisonment for debt has been abolished. Upon this we have only to remark that there is no imperious principle of legislation that we are aware of in favour of granting impunity to roguery, and that it would be much safer to bring the habit of national boasting into accordance with the actual state of the law than to alter the law to suit a false and foolish boast. It will be seen that there are two questions involved in this matter—first, whether debtors who are able to pay and will not pay should be imprisoned; and, secondly, whether, if they are to continue to be imprisoned, they are to be regarded as proper subjects for charitable relief. We dismiss the second of these questions as too preposterous for a moment's consideration; and we may remark in passing that Vice-Chancellor Bacon seems to have forgotten that, if provision is made for convicts' children in industrial schools, provision is also made in the workhouses for the relief of the sick and poor. As to the other question, the *Times* itself has pointed out that practically there would be very little use in keeping up the County Courts unless they were armed with the power of imprisonment as a means of dealing with contumacious debtors who refuse to pay their debts, having the means to do so. Experience has shown that a very sparing exercise of the power is sufficient to produce a good effect on debtors generally. Shut up in prison a few debtors who can and will not pay, and other debtors at once begin to think they had better settle with their creditors. If it had been proposed to abolish all power of recovering small debts, there might have been some sense in it; but if an attempt is to be made to enforce the payment of small debts, it is an act of self-stultification to deprive the Courts of the only means of putting pressure upon debtors. "If," says the *Times*, "we punish a "thief or a swindler, why may we not also punish a man who "evidently can pay a debt, but who obstinately refuses to pay?" The common sense of the question contrasts oddly with the absurdity of the answer which the *Times* gives to it.

ANDREWS *v.* SALT.

WHATEVER may be thought of the prudence or of the liberality of the Roman Catholic Church in setting its face, as it has lately done, against mixed marriages, there can be no question that if its commands were obeyed the Court of Chancery would be saved a good deal of trouble. In the case of Andrews *v.* Salt, decided by the Lords Justices of Appeal on Tuesday, the Court had to investigate a twenty years' family history in order to determine whether an infant should be brought up as a Roman Catholic or as a Protestant. The deceased father, Thomas Andrews, was a Roman Catholic; the mother, Ellen Andrews, is a Protestant. Before their marriage Thomas Andrews appears to have promised that, if the boys were brought up as Catholics, the girls should be brought up as Protestants; and if he had had the courage to keep his word, the aid of the Court of Chancery need never have been invoked. It is clear, however, that by the time a girl was born to him, which was not until the tenth year of his marriage, either his own conscience had become uneasy as to the propriety of allowing his daughter to be brought up a Protestant, or, as is more probable, his mother, who had never been told of the arrangement with his wife, had begun to press him not to leave the child in the hands of heretics. At this time his mother's wishes had more than ordinary weight with him, since he had been prevented by ill health from carrying on his business, and he and his wife had thereupon gone home to their respective families. He did make some show of effort to get the child baptized by a Roman Catholic priest, but the effort was not determined enough to prevent the mother from acting upon her rights under the agreement, and having it baptized by an Anglican clergyman. Thomas Andrews and his wife met shortly afterwards, and his family represent that he expressed great annoyance at what his wife had done. The wife, on the other hand, denies that there was any disagreement between them on the subject. The discrepancy may perhaps be reconciled by assuming that Thomas Andrews did express annoyance at what his wife had done, but that he prudently expressed it, not to his wife, but to his mother. Some months later his wife returned to her parents, and, in her absence, Thomas Andrews executed, two days before his death, a will by which he appointed his brother Joseph testamentary guardian of his two children, and directed that they should be brought up as Roman Catholics. It is not certain whether Mrs. Andrews was told of this will. At all events, neither she nor her brother-in-law took any steps to carry it out. Thomas Andrews left nothing behind him, and, by a very natural arrangement, his son, who had hitherto lived with his father, continued to be supported by his father's relatives, while his daughter was supported by her mother's relatives. When the girl was nine years old the testamentary guardian thought it time to assert some right over her, and accordingly called upon her grandmother, Mrs. Fleetcroft, with whom she was

then living, to give her up into his charge. This was in April 1871. The demand was at first refused, and afterwards yielded to. At the end of the same year, however, the child went on a visit to her grandmother, it being understood that she should return to her uncle in three weeks. When the time arrived the grandmother was not willing to send her back, and in the end a letter was written by the mother positively refusing to give up her daughter. Since that time—February 1872—the case has been successively before the Court of Queen's Bench, before Vice-Chancellor MALINS, and before the Lords Justices of Appeal. The Court of Queen's Bench held that the legal right of the testamentary guardian to the custody of the infant was indisputable. The VICE-CHANCELLOR held that there were sufficient reasons to induce the Court of Chancery to restrain the testamentary guardian from enforcing his legal right. The Lords Justices have now had to determine whether the order made in conformity with this view should be affirmed or rescinded.

The opinion of the Court of Appeal is the same as that of the VICE-CHANCELLOR. They set aside the claim of the testamentary guardian, and consign the child to the custody of her mother's relations. In former cases of this character the decision has often turned upon the injury resulting to the infant from a sudden and forced change of religious teaching. In this case this element was wanting. The Lords Justices have had the usual interview with the child, and they are of opinion that she "has not acquired the distinctive principles "of the Church of England to such an extent as to make it "wrong and cruel that she should be educated in the Roman "Catholic religion." The points to be determined therefore were, first, what is the legal effect of an agreement made before marriage between a husband and a wife of different persuasions that boys should be educated in the religion of the father and girls in the religion of the mother. If such an agreement constitutes a binding contract, the testamentary guardian would in this case have no right to the custody of THOMAS ANDREWS's daughter. The Lords Justices hold that such an agreement does not constitute a legal contract. At first sight it may seem hard that a husband should be able to disown an arrangement into which he has voluntarily entered, and without assenting to which possibly he would not have gained his wife. But the Court of Chancery has to consider the consequences of taking upon itself to enforce a contract of this kind. In the last resort they would come to nothing less than this—that the Court would take a child from the custody of its own father, and compel him to pay for its education under guardians of a different religion from his own. If the Court is not prepared to go this length, it can do nothing really efficacious. Who is to decide what constitutes education in a particular religion. If a Protestant child lives in the house of a Catholic father, or if a Catholic child lives in the house of a Protestant father, how is the Court of Chancery to ensure its being educated in a religion which is not that of any other member of the family? If it were to insist upon the appointment of a tutor or governess of the religion in which it has to be agreed that the child shall be brought up, what guarantee could it ask that the influence of the tutor or governess shall not be counteracted by the influence of the father, or that in making choice of a tutor or governess the father shall not stipulate that their control of the child shall be merely nominal? Whatever moral force, therefore, an agreement of this kind may possess, it is impossible to invest it with any legal force. It is of the essence of a contract binding in law that it shall admit of being enforced by process of law; and a very cursory review of the difficulties which would attend such an attempt in the case of the education of children will show that an agreement on the part of a father to bring up children in a particular religion is wanting in this elementary condition.

The next point which the Lords Justices had to determine was whether the rights of the testamentary guardian had been barred by his neglect to assert them. The Lords Justices held that they were so barred, and considering that the guardian, knowing that the girl was being brought up a Protestant, acquiesced in this state of things from February 1863 to April 1871, they could not have come to any other conclusion. The case against the testamentary guardian was strengthened by the fact that the mother was in no way to blame for bringing up the child in her own way of thinking. There is nothing to show that she was acting against what she knew to be her husband's wish. On the contrary, she was acting in the spirit of an arrangement to which he had given his consent, and which he does not seem to have repudiated in any definite or unmistakable manner. After a husband has told his wife that their daughters are to be brought up in her religion, she may fairly require such an unmistakable repudiation before consenting to regard his promise as no longer in being. THOMAS ANDREWS knew that his daughter had been baptized by a clergyman of the Church of England, and this certainly constituted sufficient notice that his wife intended, if left to herself, to bring up the child as a Protestant. He took no steps however between May 1862 and February 1863 to prevent his wife from carrying out this intention, and though in the end he appointed his brother guardian of his daughter as well as of his son, and directed that she should be educated as a Roman Catholic, he did not tell his wife what he meant to do or lay any special injunction upon her not to resist his wishes. The guardian might have supplemented his brother's neglect by communicating the contents of the will to his sister-in-law, and insisting on her making arrangements for the education of the girl in her father's religion. Instead of this, he allowed her to remain under the charge of her mother and grandmother for eight years. Unless the rights of a testamentary guardian are held to be as indefeasible in equity as they are in law this conduct must be held to have forfeited them. With the pre-matrimonial agreement and the claim of the guardian thus got out of the way, the Court was free to consult the obvious interests of the child by allowing her to remain in the custody of the relations by whose bounty she has hitherto been maintained. It is satisfactory that a decision so consonant with the welfare of the person principally concerned should proceed on principles which give no cause for triumph to enthusiasts in either Church. The considerations which have led the Lords Justices to declare that the child shall be brought up as a Protestant would, under analogous circumstances, have led them by the same road to declare that she should be brought up as a Roman Catholic.

ALPHONSO'S WISH.

ALPHONSO the Tenth, King of Leon and Castile, enjoys a singular immortality as author of the celebrated wish that he had been consulted at the creation of the world. The form of the remark is rather profane; but a very large number of people re-echo the sentiment. Tell a reformer that his schemes are chimerical, and he will generally reply in substance, So much the worse for the fact. Just change the fundamental laws of human nature, he says, and war shall be abolished, crime disappear, and universal order reign amongst mankind. In other words, if only he had been consulted, the millennium would have begun a good many years ago. Passing over the form of the aspiration, we may perhaps say that it is not quite so ridiculous as appears at first sight. It may be as well at times to dwell in an ideal world, even if the conditions of our imaginary dwelling-place be such as can never be fully realized. Who knows, indeed, what changes may be possible in the coming years? Which are the unalterable laws of human nature, and which can be modified by judicious training? It is not easy to draw the line precisely. Perhaps, as science advances, we may discover that it is possible to change much that now appears to be irrevocably fixed. A wider knowledge of the laws by which the universe is moulded may give us powers of which at present it seems mere madness to dream. And though Utopia is a very unhealthy region considered as a permanent dwelling-place, occasional excursions within its borders may give a pleasant relief to the harsh realities of life, and may even at times lead us to some profitable suggestions. Even as a mere play of fancy such excursions may be amusing, and certainly imply no irreverence. The profanity does not consist in suggesting that men might have been in every way much better than they are, but in repining against the appointed evils of our lot. The fact that the world is not all that we could wish is only too palpable; and the error consists, not in admitting the fact, but in the absurd assumption that our wishes ought to have been exclusively consulted.

The ordinary mode of constructing Utopia is by imparting a little more wisdom and virtue to our "airy burgomasters," as Milton calls the citizens of Plato's Republic. In a humbler way we sometimes think how much might be done by a few physical alterations of no great difficulty, and which may conceivably be accomplished when Mr. Darwin's speculations have been carried to their legitimate result. Take, for example, one change which frequently occurs to us as desirable at concerts, in the House of Commons, and occasionally even in church. Human beings are so constructed as to be able to shut their eyes; and a man suddenly deprived of that power would be in danger of going mad. But why should not the same principle be applied to ears and noses? What an advantage any one would enjoy in the struggle for existence who could at will hermetically close all the avenues by which his senses are assailed and his mind distracted? The perorations of dreary orators, the piano in the next house, the strains of the organ-grinder in the street, would beat in vain against ears provided with a complete natural defence. People now close their eyes in order to concentrate their attention, especially upon a dull sermon; but a closing of the ears would be obviously a more effectual remedy against distraction, and would be less provocative of sleep. A man who could at a

moment's notice shut out all audible annoyances would carry his study about with him, and be able to sit down to work at a moment's notice in the midst of a crowded assembly. On the same principle, we always envy the hippopotamus when we see him rising from the water with his nostrils closely compressed. The power of smelling is undoubtedly useful, but it brings with it at least as many annoyances as pleasures. An inhabitant of London is assailed by more or less unsavoury odours during nine out of ten of his waking hours, in order that he may possibly enjoy the scent of a flower or the savoury forewarning of a good dinner during the tenth. It is no wonder that, under such circumstances, the power should have become enfeebled. To a dog the world doubtless presents itself as a collection of delicious scents, whilst the sights with which they are associated must be quite a secondary consideration. But human beings are disgusted by canine delicacies; and a sense which has brought so many pains in proportion to its pleasures is a possession of questionable advantage. If only we were capable of shutting out the disagreeable influences whilst laying ourselves open to the delicious ones, we might cultivate our sense of smell until it became as exquisite as that of the inferior animals. Or, again, it is obvious to remark upon the extreme inconveniences connected with the present mode of supplying teeth. Decay and accident reduce many of us to the condition of edentate animals before we have lived through half our natural term. The agonies which the race endures from toothache are probably as great on an average as the agony inflicted on a small minority by bullets and bayonets, and the mortality caused amongst infants by the process of cutting their first teeth is disastrously great. We are not, as we fully admit, in a position to suggest any better arrangement for masticating our food. Perhaps, as the intellectual predominates more decidedly over the animal nature, we shall ultimately do without teeth altogether, as it is said that some teeth are already apt to absent themselves from modern jaws. An improvement in cooking would necessarily accompany such a change, and civilization would be advanced in one of its most essential departments. There is, indeed, something rather disgusting to a philosophical mind about eating in general, and perhaps in a more refined age we shall be able to support ourselves entirely by smoking, or by some less gross method of assimilation. Meanwhile it is obvious to remark how great an advantage is possessed by some of the inferior animals. If, like rabbits, we had a constant supply of teeth steadily growing, instead of having to content ourselves with the niggardly allowance of two sets for our whole life, we should be free from many inconveniences. To make one more suggestion of a similar kind, is there not something very questionable about the present distribution of the human hair? When our great-grandfathers, the gorillas, took to rubbing off their natural garments from their bodies, in obedience, as it may be supposed, to some primitive laws of fashion, they were initiating a very questionable movement. The loss of tails had occurred at an early period, and probably deprived us of an appendage which would have been very convenient, and capable of much oratorical expression. But why should we have parted with our hair? and, still more, why should we have retained it in its present arbitrary positions? The naked skin of a pig is disgusting to our taste, and why not the naked skin of a human being? At any rate a beard, in spite of accidental associations, is so palpably awkward in its arrangement that a large part of mankind gets rid of it by artificial means. A whale finds a practical advantage in straining its food through a sieve inside its mouth; but to carry an external network upon which soup and other articles of consumption may leave greasy deposits is surely a flat contradiction to all common sense. A human being, one would have said, should have kept his mouth clear, whilst the rest of him should have been clothed with a fine coat of hair, or, better still, of feathers, which admit of an infinite variety of gorgeous colouring. Tailors' bills would have been saved; though it must be admitted that moulting would probably have been rather a disagreeable process.

The mention of feathers, however, suggests another point. Immense advantages might have been obtained if the leading order of creation had been developed, not out of monkeys, but out of birds. Many birds show an amount of intelligence equal to that of any of the terrestrial orders; and they possess powers which one would have thought would have been singularly useful in the development of civilization. At the present moment the most important material change to which we can look forward is that which would result from the contrivance of some practicable means of aerial travelling. If our remote ancestors had possessed that power from the earliest ages, they would by this time have reached a point of cultivation to which we can only look forward in the dim distance. Comparatively brainless as it is, a bird has attained some accomplishments which reduce us to despair. Everybody can sympathise with Shelley's description of the skylark, whose inarticulate music seems to express a greater fulness of joy than any which falls to the lot of weary humanity. What then would be the effect of giving to a skylark the brain of a Shelley? Should we not have strains of a poetry more ethereal than any which has ever greeted human ears? If indeed the question were between wings and hands, it is probable, as the result seems to have proved, that hands are on the whole the best of the two. But why should the vertebrates be condemned to possess only four limbs? The conventional angel is, we believe, an impracticable, though a singularly beautiful, form; but every vertebra is potentially developable into a limb; and, by a few judicious arrangements, it might surely have been possible to contrive a being which should combine the advantages of an eagle and a man. Perhaps, too, it may be worth asking whether Mr. Darwin's tidal animal did not make a mistake when it took to the land instead of the sea. A race of mermen would enjoy many indisputable advantages. They would live in a region of comparatively equable temperature; the comparative lightness of solid materials in water would enable them to raise structures incomparably grander than those which we have contrived in our thin atmosphere; and, instead of being partitioned off into separate continents, they would be able to form a cosmopolitan society spreading through the whole world. Birds and fishes share the advantage of this indifference to the barriers which divide our petty societies, and have the other indisputable advantage that, instead of being restricted to move along a plane, they naturally live, so to speak, in space of three dimensions. Vertical movement is to them nearly as easy as horizontal movement to us.

A further reflection is suggested by this. Might not the habitable earth have been arranged in far more convenient forms? Sir Charles Lyell has shown how much climate might be improved by altering the distribution, without altering the proportions, of sea and land. The speculations of philosophical historians again have shown how great an influence has been exercised upon civilization by the distribution of territory. The existence of vast continents has been unfavourable to the development of the higher forms of society. Suppose that they had been all broken up by inland seas skilfully arranged, might we not have had many repetitions of Greece and Italy instead of wildernesses of negroes and Australian savages? Should we not at the present day have been further advanced, and moreover protected effectually against that tendency to excessive centralization which is one of our modern dangers? Or again, whilst we are in the vein of speculating, might we not find a good deal to alter in the arrangements of the solar system, and indeed of the universe? Why should not the planets be within hail of each other? Why should matter be broken up into infinitesimal atoms distributed through the illimitable bounds of space, instead of being aggregated into one stupendous ball? Why—but perhaps our speculations are a trifle chimerical, and it may be as well to stop in time.

One reflection, indeed, may be added. Perhaps, in space or time, all the conditions of which we speak may be verified. New forms of animal life and even of rational creatures may be developed; new arrangements of sea and land will be gradually brought about; and, as Mr. Herbert Spencer suggests in one of his boldest reveries, the planets will some day fall into the sun, the sun into some other star, and perhaps the whole material universe come together in one tremendous crash. This consummation, however, is not likely to take place just yet. Meanwhile the only use of such speculations, if they have any use, is to suggest how curiously limited are our notions of the universe, and what vast potentialities may be lurking in the world around us, of which we can take very little note. It never strikes us with any particular surprise that men should be formed just on that particular plan with which we are familiar and on no other; and yet, when one thinks of the infinite variety of modes in which matter might be combined, it somehow seems as if we ought to feel, if not surprise, yet a kind of wonder, at the special arrangement adopted, or at least at our incapacity for conceiving any other.

FELLOWSHIPS AND LIBERAL EDUCATION.

THERE is a notion abroad among the general public, not unfrequently encouraged by the unguarded language of persons who ought to know better, that college fellowships are a mere superfluous excrescence, not to say a mischievous encumbrance, on our present University system, and that as such they ought to be wholly abolished at no distant day. The impression which appears to prevail in the minds of most reformers who, on the strength of superficial acquaintance, take upon themselves to give good advice in this matter, is to the following effect. A college fellowship is a money prize of inordinate value, in the shape of an annuity of indefinite duration, given for proficiency in the very studies for which the University degree ought alone to be a sufficient encouragement and reward. It is a wasteful bounty for which no one gets any return; and the funds now absorbed in this way by a certain number of fortunate individuals ought to be appropriated to the payment of working teachers, so as to give the benefit of them to the whole body of students by making the general course of University education better, cheaper, and more extensive than it is at present.

Now it may be conceded at once that, notwithstanding the partial improvements made by the last University Commission, the tenure of fellowships is still far from being in a wholly satisfactory condition. No one can be more keenly aware of this than the resident members of some of the leading colleges, who have been giving their best efforts to devise means for reconstituting their several polities on a right and reasonable footing; efforts which, however, are likely enough to be superseded by the wisdom of Parliament, stimulated perhaps by impatient ignorance outside Parliament, unless in the course of the next year or two it should come to be more generally perceived that in dealing with the constitutions of colleges, as well as of States, it is worth while to understand them before you demolish them. The popular view,

as we fear we must call it, of the inutility of fellowships, which we believe we have not unfairly expressed, is such a view as is naturally taken by observers of otherwise competent intelligence who do not give themselves any trouble to understand the actual working of somewhat complex and anomalous arrangements, finding it more pleasant, and indeed more effective, to be content with roundly stated generalities. For our own part, we do not profess omniscience even within the limits of English Universities; and the remarks we are about to make are to be taken as applying chiefly to Cambridge. Only when we find that sweeping and indiscriminate charges are not borne out by the facts in that part of the case of which we have some actual knowledge, we are led to entertain a strong suspicion that they are not likely to be much more correct in the rest.

So far, then, as our knowledge goes, these charges in their usual unqualified form are at least exaggerated and misleading. It is not generally true that a fellowship is a mere prize for University studies. The college does generally get some return for it, even if not in the shape of teaching; and, further, in a considerable proportion of cases a fellowship does practically become a direct payment for valuable work done in University education.

In the first place, the criticism is sometimes heard that the University examinations for honours involve a danger of cramping the course of reading within too rigidly defined limits, and sacrificing the pursuit of knowledge for its own sake to what may be called the examination-faculty. The danger is real, and it is good to be reminded of it whether by friends or foes. And if the state of a man who resides after his degree in the hope of a fellowship were merely a continuation of his state immediately before his degree, this would no doubt be a grave objection to the institution. But the fact is that fellowships, so far from aggravating the vices attendant on the system of awarding University honours, act in some ways as a corrective of them. A man who has just taken a good degree is in possession of at least some of the chief instruments of a liberal education, and has learnt to manipulate them with considerable skill; but it is an exceptional case if at this stage the actual knowledge he has acquired in the use of them bears anything like a due proportion to the technical training which has hitherto occupied so much of his time. Before he throws himself for good and all into whatever is to be the principal business of his life, he still wants an interval to complete the furniture of his mind by study of a freer, larger, and more independent sort. We do not say that the state of things we describe is good in itself, or that it may not be desirable and possible to revise the whole plan of University education so as to mitigate it; but there is no doubt that, so long as the general plan remains what it is—and there are very few signs just now of any change either from within or from without—men who reside for some little time after their University examinations are over are decidedly the better for it. It would be hardly too much to say that there is often more fruitful and liberal education in the work a man does in the year after his degree than in all he has done in the three years before it. But what is to keep him at his college for that year? It is obvious that few men can afford to give up time to the improvement of their minds for its own sake at an age when there is every temptation to make sure of an early start in the race for this world's goods. To most it would be in all material respects a dead loss. Those who are enlightened enough to need no positive inducement to fill up the shortcomings in permanent value of reading which took no thought beyond the examination of the morrow may be quite unable to do so without an indemnity. It is the prospect of a fellowship which meets this want by keeping on the spot for a short but valuable season the men who are most likely to profit by it. It does not matter so very much whether any special direction is given to their work; the main thing is that it is done out of harness, so to speak, and without the constant vision of a competitive scale of marks. But the conditions of election, at one college at least of no mean rank, are such as to distinctly favour a more free development of individual excellence than is possible under the yoke of the Tripos. Thus a fellowship is something more than a mere prize added to the honours of a high degree. It is a security for the continuance of liberal studies which would otherwise be unprofitable. Fellowships are sometimes stigmatized as rewards for useless knowledge. It is just because the higher branches of learning are useless—that is, have no immediate money value except to the few who mean to make teaching their profession—that they require artificial encouragement. Such encouragement is but partially and inadequately given by the general University course, and the fellowships help to supply it. It is true that the want ought not to exist, and it ought not to be beyond the skill of University reformers to devise a remedy. But in the meantime we do find, as an integral part of the existing machinery, this institution which provides a kind of compensation, roughly and almost by accident, if you will, for certain glaring defects; there is ample scope for reforming and improving it in detail, and the task of doing so is comparatively simple; but it cannot be wholly abandoned without putting something in its place; and if we make up our minds to dispense with it, we must also be prepared to remodel the whole structure.

Next, let us see whether a college may not derive some appreciable benefit from even its non-resident Fellows who do no specific work for it. It is a mistake to suppose that a non-resident Fellow has absolutely nothing to do but to pocket his dividends. While he remains a member of the collegiate body he is entitled to take an active interest in its affairs, and may have a voice in its government. It is true that there are at present no means of enforcing the attendance of non-residents at college meetings; but it is found, at any rate in the college which is chiefly in our mind, that non-resident Fellows do for the most part attend college meetings pretty regularly, and that their presence contributes a very useful element. They help to multiply the points of contact with the outer world, and to preserve the resident body from the narrowness and isolation of which there is always a certain danger. As for the assumption, which we have seen quietly made in a leading article on this subject, that the business done at college meetings is merely formal, we can only say that it is wholly mistaken. It is to be observed that the tenure of non-resident fellowships, though in theory not limited to a fixed term of years, is practically kept within bounds by the terms on which the fellowships are held. Most fellowships are held on condition of remaining unmarried, and many on condition of taking orders within a certain time. These conditions, though not originally intended for any such purpose, act in a rough way to prevent the stagnation which would ensue without them. They work, however, imperfectly and capriciously, and public opinion has widely grown in favour of replacing them by a short and certain tenure in the case of Fellows holding no college office.

In the case of working residents their operation is not only less convenient than it might be, but in various ways positively obstructive. For a working college officer has to look to his fellowship for a considerable part of his payment. It is true that tutors and lecturers do receive additional emoluments, but no one acquainted with the subject will say that they are on the whole overpaid. The fellowships held by working college officers are in fact utilized to their full extent as payments for work actually done. But the inconvenient conditions attached to them have been but very partially relaxed by recent legislation; and men are naturally unwilling to enter upon a profession hampered with such conditions. This is one of the chief reasons for the difficulty, now much complained of, found in securing a sufficient proportion of the rising generation of Fellows for the teaching staff of the colleges. At present they have very little inducement to stay. Even those who are disposed to make education their profession can generally do much better as schoolmasters than as college lecturers.

These defects might obviously be remedied without losing any of the good points of the present system or making any violent change in the constitution of either colleges or Universities. At the same time it may be reasonably doubted whether the abolition of tests in the Universities has so far reduced them to the condition of lay institutions that their function of contributing a learned clergy to the Established Church should be repudiated. Clerical fellowships may be somewhat difficult to fit into an educational system; but they need not therefore be pushed aside as an anomaly and an inconvenience. They also supply an acknowledged want, though of another kind. The ordinary tenure of fellowships apart from college offices should be limited to a short fixed term of years. The working residents should be provided for by emoluments commensurate with their work, and held on such terms as to induce them to look on it as a permanent profession. Perhaps it is of no great importance whether an extended tenure of their fellowships is conferred on them by that name or not; but any provision which is made must have that effect in substance, and we see no reason why the name should be lost. There is no doubt that it is possible to frame a reasonable and satisfactory scheme of this kind; nevertheless we do not suppose any such plan would be likely to satisfy those who contemplate some large and undefined project of University reform wholly inconsistent with the existing constitution of the English Universities. When any such project takes a definite shape it will be time to see whether it is so good as to make it worth while to abolish what we have already. In the meanwhile it appears to us that on many points relating to University education, and notably on this particular matter of fellowships, much of the partial criticism now afloat is unfair and misconceived.

Since the preceding observations were written a memorial has been presented to Mr. Gladstone from Cambridge on this subject, and is acknowledged in his reply to be an "important document, which sets forth the views of a large and weighty part of the residents of Cambridge." The proposals of the memorial coincide in substance with the suggestions we have advanced, and it is satisfactory to see that they have been well supported, and that there is hope of their receiving due attention in any general plan that may be brought forward.

THE *TIMES* AND THE ARTISTS.

THE *Times* has just been moved to address an earnest exhortation, or rather remonstrance, to the artists of the day. It is not at all disposed to share the gloomy despondency of the *Quarterly Review* as to the present condition of English art. The *Quarterly* holds that the work of our painters bears witness to our incapacity for all elevated thought, and fears that "we shall be known to succeeding generations as belonging to an age in which almost every spark of the epic and heroic had been quenched in the grave of a hopeless materialism." The *Times*, on the other hand, is satisfied that "only an inveterate depreciator of his contemporaries will deny that there is a steady improvement in the general character of the works submitted to the public judgment." What distresses the *Times* is, not a deficiency of artistic power, but the disposition of artists to waste their time, colours, and canvas

either on historical incidents of a remote period, or on subjects of the day which do not fall within the scope of ordinary newspaper paragraphs. "What," it asks, "is the world in which the painters live?" Don't they read the *Times*? don't they even take in a penny paper? If they do, there is no trace of it on the walls of the Academy. For all that appears there, "the history of our own time might as well never have been written." What the *Times* seems to have expected to see on the walls of the Academy was a reflex of its own columns, and it is naturally shocked to find that "our artists live in a world of their own, a professional fairy-land"—quite beyond the reach of morning or even evening papers — "whither no sound of the actual, moving, heaving world without can come, and in which the dramas which change the face of the Old World and the New are quite unknown." For a moment we might fancy that the *Times* and the *Quarterly* are at one, for the former goes on to declare that "if Art"—by the way, has it been observed that the late Lord Lytton seems to have made a testamentary disposition of all his capital letters to the *Times*?—"is not to be entirely divorced from human life in its grandest and most tragic developments, the traditions of our British school must be at fault." We doubt, however, whether the writer in the *Quarterly* would agree with the writer in the *Times* that the Art of an age should be "correlative with its public life," and it is possible that he might not receive very respectfully the suggestion that the aid of photography should be sought in order to illustrate "English national history."

The *Times*, it seems, has no objection to "well-painted landscapes," or "clever illustrations of poetry or fiction or bygone history," or even an "idyllic representation of English life." There is no harm in these things, and they may be tolerated up to a certain point. But surely it is deplorable that "the most interesting incidents of a most interesting age should pass away without a record," and that the leading articles and special correspondence of a great journal should receive no artistic illustration on the walls of a fashionable exhibition of pictures. And then the *Times* goes on to enumerate some of the subjects which it would have been glad to see transferred from its columns to canvas—"armies by the million in the field," "entire hosts carried into captivity," "the most beautiful capital in Europe doomed to the flames by its own desperate defenders," "a war of unprecedented obstinacy"—the writer has never perhaps heard of the Thirty Years' War, or even of the Crimean War, or the Civil War in America—"and devastation softened by admirable displays of religious zeal and true philanthropy." All this means, we suppose, when put into plain language, the march of the German armies, the surrender of Sedan, the feats of the *pétroleuses* during the Commune, and the convivial adventures of the nondescript people who lived at ease and wrote newspaper correspondence under pretence of nursing the sick and wounded. Artists are also invited to depict "the social changes which have transformed the Russian Empire and the American Republic," and "our own busy political life, with all its noble and dignified, its grotesque and humorous incidents." This seems to point, as far as our country is concerned, to pictures of the Irish Church Bill in Committee of the whole House; Mr. Cardwell explaining the details of his Army scheme to a sullen military audience, gradually dropping off into peaceful slumber under his soporific eloquence; Mr. Whalley asking questions about the Pope and the Tichborne Claimant, and being called upon for a song; and those other "grotesque and humorous incidents" which many persons think have been sufficiently commemorated in the *Happy Land*. As for the "social changes" of the American Republic, the shooting of Colonel Fisk might perhaps furnish materials for a thrilling picture, although the doubts of the citizens of New York as to whether it would not be ungrateful to hang the murderer would supply a still more suggestive subject to an artist capable of doing it justice. An historical panorama of the varied scoundrelism of the Erie Ring would certainly possess a curious interest of its own, but after all we are hardly disposed to join with the *Times* in deploring that these great events should be neglected in "the Art of the period."

The only reason which occurs to the *Times* why events of the day are not eagerly seized upon by painters is, that, "there is in England a strong liking for what is nice and agreeable," and that there might be supposed to be a difficulty in treating the "social changes" of Russia and the United States, and our own "busy political life," in this manner. The *Times*, however, has so much faith in the innate propriety and decorum of British artists, that it is quite confident they could portray "the great events of the day" in an aspect at once truthful and picturesque," and at the same time nice and agreeable. Indeed so unbounded is its confidence in this respect, that it believes that even a picture of the Congress of Geneva might be made "nice and agreeable." The *Times* is quite surprised that no English artist has given us the Arbitration of Geneva, which, it says, is "likely to be memorable in the world if the principle of Arbitration"— big A of course—"be generally adopted on the strength of its example." We are quite ready to admit that it will be memorable, even if the principle is not generally adopted, and perhaps most memorable if it should turn out to be an example scrupulously avoided; but still we have our doubts about its suitability for artistic treatment. The *Times*, we are afraid, when it made this rash suggestion, can hardly have reflected on the possible consequences of inciting English artists to venture upon a representation of this historical scene. It has been authoritatively stated that the only object of the arbitration was to please the Americans; and the English member of the Tribunal of Geneva has been rebuked by at least one member of the English Government for discussing the legal bearings of the judgment lest his remarks should ruffle our very sensitive friends. It is quite conceivable that an English painter might produce a picture of the Congress which might not give satisfaction on the other side of the Atlantic, and all the good of the arbitration would thus be neutralized. On the other hand, an English artist might find some difficulty in doing justice on canvas to Mr. Caleb Cushing's graphic descriptions of the great event from the American point of view. Count Sclopis's "large stature, dignified presence, high breeding of rank, but without pretensiveness," Mr. Staempfli's "piercing dark eyes and jet black hair," and Viscount Itajuba's "fair complexion and air of gentleness and amiability," might not be beyond the resources of art; but we are afraid there is no living painter who could adequately portray Chief Justice Cockburn's "tendency to declamatory denunciation of adversary opinion," biliousness of temper, prolixity, disrespect to the Tribunal, negligence, disingenuousness, fault-finding, imputations of bad motives, and other peculiarities. A painter might indeed endeavour to depict Sir Alexander "disappearing like a criminal escaping from the dock," but this would not be enough unless he also brought out the concentrated malignity and turpitude of Mr. Cushing's pet aversion. On the whole, we have some reason perhaps to be thankful that the painters have let the Congress of Geneva alone, and also that they have had the good taste to avoid the agonies of the battle-field and the lurid horrors of revolutionary incendiarism. Another of the *Times's* suggestions is that India offers a fine field for the painter, especially as he can now command the assistance of photography. We suppose that this means that an artist who has a good collection of photographs of Indian scenes and figures need not trouble himself to visit the country, and the hint is certainly quite in keeping with the rest of the article. Nobody can doubt that India offers a noble field to an artist capable of turning his opportunities to account, but it may be doubted whether pictures in Zoffany's style are not sufficiently represented by the woodcuts in the illustrated papers. Although the *Times* spells art with a capital letter, it seems to take a very low view of its aims and functions. Art, in its true sense, has an end of its own apart from the dissemination of useful information as to foreign countries and the pictorial record of current events. It is natural, of course, that people should like to have pictures of the battle of Sedan, the sittings of the Congress of Geneva, Paris in flames, the House of Commons on the night of a great debate, and similar subjects, but it can hardly be said that the supply does not keep pace with the demand. The *Times* has only committed the mistake of looking for it in the wrong place. There is no lack of illustrations of national life taken hot and hot while the events are fresh in everybody's recollection, and very good illustrations they are too in their way, only they have not yet found their way into the Academy. There are good reasons, if the *Times* could only understand them, why it is not desirable that art should enter into competition with the penny-a-liner, or even try to emulate the glorious achievements of "Our Own Correspondent."

If anything could make us hopeless about English art, it would be the prevalence of the sort of notions as to the scope and objects of art which are expressed in such an article as this, and which no doubt meet with the approbation of many worthy people. Measuring English art, not by its highest works, but by the majority of pictures, there has undoubtedly been a decided advance in mechanical skill. Every year there is a larger number of pictures of average merit and commonplace excellence, but the decline, not only in intellectual purpose, but even in mere technical aims, is almost equally conspicuous. The blame, however, does not rest so much with artists as with their patrons. Even without being sordidly mercantile, an artist is naturally influenced by the tastes and desires of the people who buy pictures, and there are "pot-boilers" of all degrees of merit. In a generation of rich men destitute of intellectual culture or artistic perceptions, and given over to the indulgence of mere personal vanity, it is not surprising that art should reflect the narrowness and triviality of its most profitable customers. What the wealthy patron of art wants is to surround himself with portraits of himself and his family, and with other pictures that respond to the narrow range of their tastes and intelligence. Hence it is that wherever you turn in the Exhibition you see the same dull level of commonplace prettiness and self-complacent mediocrity. Nothing can be more poor and trivial, as well as hackneyed, than the majority of the subjects chosen for delineation. It is a doubtful point whether artists do well to take their subjects from books; but if they will go to books for subjects, they might at least be expected to extend their course of reading a little. Here we have all the familiar characters and incidents trotted out year after year—Lear and Cordelia, Prince Arthur and Hubert, the Lady of Shallott, Lord William and Lady Russell, the Eve of St. Bartholomew, Pepys, Chatterton, Dr. Johnson in Bolt Court, and all the rest of our old friends. This year, however, we are thankful to say nobody has found the body of Harold, and we have not been able to discover even a single scene from the *Vicar of Wakefield*. The test of a good picture is, of course, that it shall convey a distinct, definite idea worth carrying away; but there are hardly half-a-dozen pictures in the whole Academy that can be said even to approach to satisfying this demand, or that indicate the faintest perception on the part of the artist that it requires to be satisfied. It is true that a painter, like a poet, will never do much who

does not draw his inspiration from the age in which he lives, but it does not follow that he should devote himself, as the *Times* suggests, to the illustration of contemporary history with the assistance of photography. Almost from the nature of the case, contemporary history is opposed to artistic treatment of a high order, in which the ideal must always be largely mingled. An artist must study humanity for himself as it exists under his eyes; but he must also be on his guard against allowing his view to be disturbed or discoloured by the passions, prejudices, or caprices of the hour. Passing events are too large to be brought within the focus of true art; and the medium through which they are seen is almost necessarily fatal to artistic insight and impartiality. The reason why battle pieces belong to such a low phase of art is simply that the natural suggestiveness of the subject outruns the artist's efforts, and the same may be said of most of the incidents of current history. There is no reason, however, why, while leaving topics of the day as hitherto to the ready pencils of the illustrated papers, artists should not endeavour to rise to the contemplation of everyday life in its higher aspects. There is surely more to be found in

> This live, throbbing age,
> That brawls, cheats, maddens, calculates, aspires,
> And spends more passion, more heroic heat,
> Betwixt the mirrors of its drawing-rooms
> Than Roland with his Knights at Roncesvalles,

than the mere boudoir prettinesses and nursery beatitudes which compose the stock of this year's pictures. There are sterner, nobler, more heroic, and more spiritual aspects of life which should hardly be ignored; and it is here that we come upon the most serious deficiency of modern art.

CITY CHURCHES.

THE old question of the ecclesiastical condition of the City of London with its numerous churches and its diminished population has again been brought before Parliament. A measure bearing the vague and misleading title of "Union of Benefices Bill" struggled through a Select Committee of the House of Lords last year, and then reached the Commons too late to be seriously entertained. It has during the present Session been introduced into the Lower House; and, after having been again handled by a Select Committee, is now awaiting the further consideration of a Committee of the whole House, if it escapes a direct opposition from Mr. Candlish, apparently prompted by the belief that it is a measure calculated to be of some practical benefit to the Church. The Bill itself is in its form one merely to amend the existing Act of 1860 as to the procedure necessary for carrying out a foregone conclusion, by transforming a series of separate Commissions—named in each case by the Bishop of London, but always composed of the same men—by whose advice City livings are now united, into a single body, stiff for a few years with official dignity and Parliamentary recognition, and by doing away with some preliminary sanctions which have hitherto happily, or unhappily, checked the rapid working of the measure. Still the introduction of this Bill has virtually stirred up again the whole question of the policy of pulling down City churches and of consolidating the benefices. No one indeed absolutely denies the lawfulness or the expediency of making some reduction in their number; but the distance between a grudging acceptance of the theoretic case and a strong belief in its practical value may involve the whole difference between the pious desire of solemnly pigeon-holing the measure and the fervid determination to convert it into an engine of ecclesiastical revolution. We are satisfied to stand by and to attempt to disentangle some of the difficulties of a very perplexed case.

Primâ facie eighty-six parish churches were an excessive allowance for the City before the Fire of 1666; and the fifty-one to which they were cut down in consequence of that event, and of which all but a few are still standing, may be accepted as excessive now. We may also admit the truism that if the very valuable sites of the superfluous churches could be turned into money, a large fund would be available for new churches in places in which they are now sadly wanted. If, then, there were no consideration involved beyond the ratios of the actual population of the City to the sittings in those churches, and of those sittings to the number of their occupants at eleven o'clock every Sunday morning, we might very safely accept a scheme of sweeping demolition, and of a large transaction in church building elsewhere. But against this merely arithmetical view of the matter a host of objections, political, social, moral, sentimental, practical, and artistic present themselves, which we shall briefly run over. We need not be stopped by the primary objection to any demolition at all of a once consecrated building as a sacrilegious act. Churches have been so often, and in all lands, altered, removed, or altogether blotted out, that it is idle to set up the feeling as a rule of action. It is, no doubt, a pious instinct, and one worthy of all respect, to shrink from tampering with buildings devoted to sacred uses for no good reason, or for merely a selfish one; and, so far, the Commissioners under the Bill will be on a stricter trial at the bar of public opinion than a mere Improvement Board would be. The conditions of that complex body the Church of England, to which these buildings appertain, give more practical reasons for moving cautiously. Each of these churches has its incumbent, and it represents at least one parish, with its compact knot of parishioners, parish officers, vestry, and that whole category of duties, responsibilities, privileges, advantages, and associations, social and administrative as well as religious, which gather round an old English parish. Many of them represent two or three such parishes; for at the one moment when a sweeping concentration would have been possible, it was neglected; and although London was rebuilt after the Fire with a diminished tale of churches and a reduced list of clergy, the old exuberance of small parishes, with their separate vestries, parish officers, and organizations, was retained, and must, as even the more moderate advocates of further demolition are forced to admit, be still kept up, for civil considerations.

The Bill itself says as much in its title, of one for the union and not for the consolidation of benefices. Let it pass, and let St. Stephen's, Walbrook, and Bow Church fall under its axes and hammers, the parishes which own these names will still exist in the same condition of invisible immortality as those of St. Anne Zachary, St. Mary Moses, or St. Martin Pomeroy. This at once limits the question to a series of comparatively narrow issues; for, the old parochial divisions being still a necessity, the fate of each church and of its parson has in each case to be settled on its own merits, on the one side being the value of the church where it is, and of its clergyman, and on the other, the good which may be got elsewhere by the money value of the one and of the other. It is in fact the universal question of squaring and levelling which the bewildered world is now so busy in codifying. The arrangement is further complicated by the City parishes being of two distinct classes, corresponding with the division, so generally forgotten, of the City itself into the portion within the walls (the City proper) and that without (the old Liberties). In fact the City itself, small as it seems on any map of the capital, represents not only the town but the suburbs of the middle ages. As might be supposed, the parishes within the walls are very small, and those without much larger. If the small parishes were unduly rich, and the populous ones of the Liberties very poor, an admirable opportunity would be afforded for one of those rough and ready reforms in which Commissioners rejoice. But unluckily London within the walls roughly represents the area of the Great Fire, and from this a further result ensues. The tithe of all the City was regulated under an Act of Henry VIII. at the high figure of 2*s.* 9*d.* in the pound, and at this it has been commuted in the parishes which were not burnt. But in those which happen to have been rebuilt after the Fire, it was replaced under an Act of Charles II., commonly called the Fire Act, by a rent-charge, which although augmented under an Act of about the beginning of the present century, still represents small stipends. So the big parishes are rich and the little parishes are poor, and the process of chopping and changing is proportionately difficult. During the halcyon days of pluralities and non-residence no one of course thought of the grievance, for there was probably no City incumbent who had not some other living elsewhere.

Now, however, the question has presented itself under the aspect not only of this apparent plethora of church provision in the City, but of that of very general non-residence, arising not only from the temptation which undoubtedly exists for the clergyman to live out of the City, but from the fact of the great augmentation of income which he can derive from letting the site of the parsonage for commercial uses; and so for about twenty years the question has been discussed, legislated on, re-discussed, and re-legislated about. The one point on which all parties seem agreed is to get as much of the spoil as they can for their own particular use; and here we are confronted with the impossibility of defining the order of the different claims. A parish is a civil no less than a religious institution, and the church may be said to partake of the double nature of the parish itself. On the other hand, London, while in one sense a single town, is in another sense a province of houses. Even in its ecclesiastical character it cannot claim unity, partitioned as it is between the sees of London, Winchester, and Rochester. So that after your church has been condemned, it will be the most difficult thing in the world to decide what had best be done with it. The lay parishioner appeals to a patriotism which need not be despicable because it operates within a narrow area; and pleads that, if necessity compels the destruction of the church which, to him at least, was both useful and a source of legitimate pride, he should first be indemnified by some improvement of his schools, by some enlargement of his narrow streets, and by some alleviation of those local burdens which exist for purposes akin to charity. In much agreement with him, the clergyman and the City man generally can well point to the separate and distinctive character of the old incorporated City of London as contrasted with the loosely jointed "Metropolis," and claim that at least the wants of the poorer alleys of the populous parishes of the "Liberties"—Holborn, Cripplegate, Shoreditch, Whitechapel—should be thought of before Westham, Peckham Rye, or Holloway. Why not, he may argue, re-arrange the City parishes within the limits of the City, and of those parts of the town which are distinctly purlieus of the City? Why not find a *raison d'être* for some of the churches whose actual pastoral duties have shrunk to nothing by assigning to them districts outlying indeed, but within a few minutes' walk of Cheapside or Cornhill? This plea is strengthened by the fact that several of the City churches, which upon the hard parochial principle might appear to have collapsed, have really become, under a more expansive system and in the hands of earnest clergymen, centres of church life. Among them we need only name St. Lawrence Jewry, so long the post of the recently created

Dean of Manchester. Why not also, remembering that non-residence is the crying evil, provide that the first lien on the accruing fund should be a convenient parsonage bought or built for those incumbents who are left? Another class of claimants, armed with antagonistic demands, are the residuary Londonors, with their ecclesiastical chiefs. No doubt churches are much wanted in the suburbs, and if a sum of money should be let loose by the destruction of some church in Laurence Pountney Lane, it would clearly be well disposed of in building another church at Camberwell, Barking, or Hammersmith. But we do not see that the church needs of Camberwell, Barking, or Hammersmith are in themselves a reason why churches should be pulled down in Laurence Pountney Lane, except on principles which might, if more generally applied, lead to rather troublesome results. The Committee of the House of Commons showed its appreciation of this reasoning by striking the nominees of the Bishops of Winchester and Rochester out of the list of Commissioners, while permitting those prelates to have a voice in the distribution of the contingent spoil.

We have purposely left out of sight—because we fear that it has been hopelessly shelved by the drift of the question—the most obvious and the least revolutionary reform in the condition of the livings of the City proper, which might have been at one time possible, and to which indeed the present Archbishop of Canterbury called attention in the Charge which he gave as Bishop of London in 1858:—

> I am aware that you cannot make men learned by giving them leisure for study; but it is certain that it is very difficult for them to become learned without it. Now, since the principal part of the revenues of this Cathedral has been appropriated by Parliament to other purposes, we must be contented if we find anywhere amongst us such situations as may advantageously be held by clergymen of studious habits without their neglecting any direct calls of practical duty. We want also situations in which men who, from advancing age or other circumstances, are not equal to the toil of an overwhelming parish, may pass their time more quietly, but not, therefore, less usefully for the Church; aiding by their advice and quiet example when they can no longer endure the tear and wear of that incessant public life in which the pastor of an overgrown parish is involved. In an age of much excitement, amid the din of perpetual outward activity, we more than ever require to have some quiet spots. Now, as a matter of fact, our City parishes in their present state in some degree at least meet our wants in these particulars. We are glad to point amongst our City clergy to names well known for learning, and we have quiet influences emanating from the City which will sooner or later be felt over the whole diocese and the whole Church. I would in no wise do away with, I would strive by every means to foster, this peculiarity of our present ecclesiastical arrangements.

The revenues of St. Paul's, as the Archbishop points out, have been otherwise appropriated. This is equivalent to stating what we have ever urged, that the Cathedral is the complement of the parochial system, and that as canonries proper are no longer available in London, as they might have been, for the manifold needs of the Anglican Church in that which is really its principal centre, these City livings, properly handled, might have filled up the gap, particularly as they possess a virtual chapter in Sion College. A large proportion of them are already in the patronage of those who might have helped on so good and useful a work—that is, of the Bishop of London, of St. Paul's Cathedral, of the Archbishop of Canterbury, and of the Lord Chancellor, and a judicious exchange of patronage might easily have swept more in. Mindful, however, of the proverb touching spilt milk, we pass on.

We have reserved to the last the architectural question. The very completeness of the victory which Gothic has achieved as the ecclesiastical style should make us more careful not to sweep ruthlessly away, nor yet to mutilate, so noble and elaborate a series of examples of the other great school of constructive art applied to sacred purposes as now exists in the City churches by Wren and his pupils, nor to thin that forest of varied steeples which so gracefully group themselves before the loiterer on London Bridge. The original Act contained a not well chosen list of four exempted churches, one of them being excepted because London Stone was embedded in its wall. A motion to enlarge this list in the present Bill so as to include all the really valuable churches of the City was lost in the Committee, and the question as it stands is left to the good sense of the yet unnamed Commissioners, subject to the instruction inserted at the same time in the preamble, "due regard being had to the preservation of churches of architectural and historical interest." The difficulty on which was wrecked that which would in itself have been the safest and most explicit procedure, was how to frame the list so as both to include churches which never ought to be pulled down, but which are still in jeopardy, and also not to seem indifferent to the eventual fate of others which ought to be equally sacred, but which seem at present too safe to require artificial protection. To give a few examples. No one but a lunatic Commissioner would now propose to pull down the stately St. Andrew's, Holborn, or that majestic fragment of a great Romanesque minster, St. Bartholomew's, Smithfield. What, on the other hand, should we do with the historical St. Magnus, Fish Street Hill, one of Wren's choicest conceptions, and the living monument of that great chapter of our history, the Danish invasions? This church seems safe, but it is not quite secure. On the other hand, there is a cluster of five nearly adjacent churches in the innermost heart of the City, the demolition of any one of which would be a Vandalism, but each one of which has been repeatedly menaced. St. Michael's, Cornhill, with a noble Gothic tower by Wren, and a body gorgeously recast by Sir Gilbert Scott, with Rogers's finest wood carvings and Clayton and Bell's most carefully painted glass, stands very close to St. Peter's in the same street, the traditionary successor of the oldest church in London, with a very picturesque spire, and an interior fitted up with more than usual care by Wren himself. The demolition of either of those churches would be an act of barbarous stupidity; so would be that of Wren's one completely Gothic church with a tower hardly inferior to that of St. Michael's, St. Mary Aldermary, now standing clear on the line of the new Queen Victoria Street. St. Michael's, too, and St. Mary Aldermary, have shown vigorous symptoms of revived spiritual activity; so also have the two adjacent churches of St. Edmund the King in Lombard Street, and of St. Mary Woolnoth, at the corner of Lombard and King William Streets. The last-named church is nothing less than an historical monument, being recognized as the *chef-d'œuvre* of Wren's greatest pupil—of whom so few works survive—Hawksmoor. Yet the General Post Office has long been hankering after its site in order to extend a branch office. We need not multiply our instances. The Committee, we think, might have been more bold in handling the question. At all events, however, it has shown by its addition to the preamble that it looked with no favour upon the Vandalism which would ruthlessly topple down churches well deserving of the reverential care of a civilized community in order to meet the indefinite claims of ill-defined suburbs. We can only trust that the Commissioners, whoever they may be, will lay to heart this monitory instruction. If they neglect it they will very certainly find their tenure of office a troublesome time.

COURIERS FOR VIENNA.

MR. LEVER'S wandering hero in *Arthur O'Leary* is magnificently entertained by a mysterious stranger who displays a marvellous acquaintance with men and things, who has an unparalleled gift of tongues, who is as much a connoisseur in art as in cookery, and who serves him a sumptuous little supper on wonderfully chased plate in a little *salon* hung with gems of the rarest masters. In course of conversation it comes out that the gentleman who thus entertains Mr. O'Leary in the Low Countries has his cottage on the shores of the Bay of Naples as well, and in fact is, to all appearance, an eccentric millionaire. If he is a millionaire, he made his money on the *grande route*, not as a highwayman, but as a courier. Mr. Lever may have exaggerated. It may have been seldom that gentlemen who followed that somewhat harum-scarum calling took advantage of their opportunities to become capitalists, or included the art of saving among their other qualities. But there can be no question that those were the palmy times of the profession, and that they are gone never to return. Before the days of railways, Bradshaws, and Cooks, most of the people who went abroad on tours were really venturing into strange countries. They knew little or nothing of the speech of the natives; there were no interpreters to be found at the different posting-houses, no offices of information in the hotels, no cosmopolitan bankers who made it their business to be cross-examined, no waiters and porters professing polyglot accomplishments. There was no taking a ticket off hand which franked you without further trouble over a couple of hundred leagues. When you posted, you pulled up every few miles to change horses and squabble with posting-masters and postilions. Frontiers were far more frequent than they are now that wars and revolutions have been obliterating the old landmarks everywhere. Passports were demanded perpetually, and they involved you in all manner of painful formalities. You were always being separated from your papers, and it was no easy matter recovering them, if you were left to your unaided exertions. You were constantly in the hands of gangs of custom-house officers, who insisted on your carriage being turned inside out, even to the contents of the sword-case, unless you were prepared to come down generously with black mail. In short, unless you had engaged some one on whom you could devolve your troubles, anxieties, and responsibilities, your tour from first to last would be a worry as well as a weariness. The chances were that you were well to do, and that money was of less consequence than loss of time and temper. So you hired your courier and gave him pretty much *carte blanche*; if you did not give it him, he was very certain to take it.

Those, we say, were the palmy days of the courier. He was hail-fellow-well-met with every landlord from Dover to the Dardanelles. He took his party to one house or the other—to Dessin or to Quillac, to the "Écu d'Or" or the "Cerf Volant"—as he found the hosts consulted his comforts and considered his commissions. No doubt the recompense for his recommendations was arranged for in the bill. His little private dinner was commended to the best care of the *chef*; and wines of the more esteemed vintages were produced for his delectation from the innermost recesses of the cellars. What may have passed between him and the landlord, when it came to be a question of settling the bill, was a mystery; they always withdrew together to the little family sitting-room behind the bar and beyond the vulgar gaze. But, whatever it might be to his master, that certainly was no very evil quarter of an hour for the courier, judging by the jolly smiling face with which he reappeared to swing himself up on the *impériale* of the travelling carriage, whence he waved the heartiest of farewells to the host in exchange for the kiss of the hand. To be sure he had always swallowed a flowing cup by way of parting ceremony, and the ample gourd that was slung to his portly person had been replenished with Bordeaux or Burgundy of body and

bouquet. But it is not uncharitable to suppose that his commissions were handsome, and that his pay, good as it was, was the smaller part of his profits. Then railways came in, and couriers began rather to go out. Theirs had been a tyranny which had not always been tempered with due discretion. Not unfrequently they had forgotten to combine the *suaviter in modo* with the *fortiter in re*. They had been in the way of ostentatiously parading themselves as protectors and guardians to the injury of the self-respect of their charges. It was difficult to avoid regarding them somewhat in the light of spies. So with the introduction of railways the people who had been used to trust to their leading strings began to try to totter along without them. Like babies, when they get to "feeling their legs," tourists soon came to run alone. Having once begun to help themselves, foreign innkeepers began to find it to their profit to help them. No doubt the smiling host had often cursed in his heart his friend the courier whose hands he squeezed and whose cheeks he kissed with effusion. He sorely grudged to the friend of his soul the commission which reduced his personal gains so materially. If he could drop the middleman out of the bargain, he could at once undersell his competitors, and get more out of his customers. So he sent his son to study English. He insisted on his waiters passing competitive examinations in languages, and although it must be confessed that the standard of their attainments was far from a high one, yet they did pick up enough of foreign words to be wonderfully comforting to strange visitors. And what with the spread of the English speech, and the establishment of steam communications which shot you rapidly from city to city, and assured you a speedy retreat should your situation abroad become trying, couriers began to be dispensed with. Newly-married couples, who used to be among the best patrons of the class, were too glad to escape from under those Argus eyes which used to be fixed unwinkingly on their endearments, and made them matter of merry jest with the maid. Young men going on the great tour, the most lavish employers of all, felt an ingenuous shame in being dry-nursed over the Continent. The presence of a body servant who spoke and thought for them smacked too much of tutors and governors, and of those days of boyhood which they desired to forget. So what with one thing, what with another, couriers went much out of fashion, except with City millionaires who sought to swell their dignity by magnifying their retinue, and with ladies and invalids who had much better reason for placing themselves under the care of Greathearts in their pilgrimage.

There seems every reason to believe, however, that the opening of the Vienna Exhibition will give at least a temporary impetus to the prosperity of the couriers' guild. There has already been a rush of visitors to the Imperial city, and by-and-by there will no doubt be greater crowds and tremendous scramble and bustle both in the city and on the roads that lead to it. It will not be a simple question of being shown to snug rooms by obsequious waiters at any house which you may honour by your patronage. It is possible that, as the season goes on, decent quarters anywhere will become matter of negotiation and bargain, and although the sinister rumours of excessive charges may turn out to be somewhat exaggerated, yet simple prudence may often counsel one to come to some understanding in advance. It is in circumstances like these that the courier becomes a real luxury, nor is he likely to be a very expensive one. He will cost a good deal no doubt; but, on the other hand, he may save a great deal even in money, to say nothing of temper and trouble. His experience and topographical knowledge will often be invaluable. He will relieve you of the higgling which an English gentleman hates above all things, whatever may be the sentiments of some managing English ladies. Then in Vienna, unless the head of the family party means to make himself the slave of his household, he must provide himself with a domestic familiar of some kind, while there are many worthy people whom the sense of loneliness and isolation on the banks of the distant Danube might render fretfully nervous or moodily despondent. It would make all the difference between enjoyment and misery to have some one in charge who knows everything you are ignorant of, who thinks for you, tends you, feeds you, and to whose coat-tails you can cling in case of necessity. To many veteran travellers in Rhineland and Switzerland there will be a terrible sense of the adventurous when they are being carried so far beyond the range of their ordinary experiences. The heroes of the *Nibelungenlied* never crossed the Danube stream with heavier anxiety as to all that might possibly be awaiting them. Tourists are no longer upon the homely Rhine, flowing through its familiar vineyards, and bearing its friendly rafts past hotels swarming with cockneys towards peaceful Holland and their English home. The Danube rushes towards the vague unknown, through wide plains peopled by semi-nomadic Magyars; through forests traversed by the half-armed Servian swineherds; past towns in the Principalities where baiting Jews and wrecking their dwellings is still the favourite pastime of the people; past tumble-down citadels that fly the Crescent, and white villages with crumbling minarets which are possibly being devastated by the mysterious plague. It is to be expected, too, that all these semi-barbarous States and provinces will send their representatives in troops to the great Exhibition. As you tread the unpaved streets of the innermost city, or make your way through the Leopoldstadt towards the Prater, you will be swaggered up against by haggard, wild-eyed Orientals, who are walking arsenals of deadly weapons. The Imperial police will give but moderate assurance to strangers to whom German is as one of the dead languages; although it may be some satisfaction to believe that Scotland Yard has sent delegates from its detective force, and that a half-dozen or so of native-bred British officers are watching over the safety of their countrymen. When a sense of the strange is brooding oppressively upon you, there may be unspeakable comfort in the thought that trusty Fritz or Karl is always gliding at your elbow like a substantial shadow.

Jesting apart, if we are to judge from the reports of the Viennese journals, a corporation of couriers has made excellent arrangements for securing efficient service and protection to intending visitors. They seem to have established a central syndicate, which doubtless has its agencies in this country, and its recommendation should be a material guarantee for character and capacity. It is needless to point out how much of the enjoyment of the journey depends on your making a satisfactory choice. Except in its essentially temporary nature, the connexion with your courier more nearly resembles matrimony than any other that we can think of. There should be compatibility of temper and habits; that is to say, a good courier, like a good wife, should pretend to give in graciously on all occasions, should manage you so judiciously that you are never conscious of the pressure which directs your path. There should be absolute mutual confidence; that is to say, you should never have a suspicion that you are being deceived, and you should remain in blissful ignorance of any injuries that may be done you. If it should unfortunately prove otherwise, you are fretted past endurance by the very closeness of the ties that bind you and your travelling companion together: you see your enemy by your bed and your board, he thrusts his finger into all your arrangements, he makes his voice heard in all your money matters, and indeed he may be said to have mastered the strings of your purse. Separation is in your power, no doubt; but you cannot separate without sacrifices, recrimination, and a good deal of scandal. Then, bad as he was, and much as you have come to dislike him, you are sure to find that you miss him and his services if he leaves you, and if you try to form another connexion in haste, the chances are that you do worse than before. The moral of which is, that persons who propose to travel with couriers had better make their arrangements in time, and apply in the quarters that offer them substantial guarantees.

ASYLUM MANAGEMENT.

IT may be taken for granted that before very long there will be a change of some kind or other in the local administration of our counties. The English Justice of the Peace is confessedly an anomalous being. He is a Government official in so far as he has his commission from the Crown, but the fact of his being unpaid of itself makes him something wholly different from the paid servants of the Crown at home or abroad. On the other hand, the fact that he has his commission from the Crown makes him something wholly different from those officers, at home or abroad, whose authority springs from popular election. He cannot stand according to either the French principle or the Swiss principle. Even in England he stands by himself. Other officers of the Crown are paid; other unpaid officers are elective. All that is to be said for him is that he is, and that it is by no means clear that anybody else would do his work better or so well. And that this can be said for him is, in our land of precedent, a good deal. An anomalous institution is in England not likely to be upset simply because it is anomalous. Still, if an institution which is confessedly anomalous is attacked on other grounds by any powerful class, the fact that it is anomalous greatly strengthens the hands of those who attack it. The county magistracy, anomalous as it is in theory, might safely go on discharging its duties both judicial and administrative, if nobody found anything to say against it except that it is anomalous. But in several counties the ratepayers profess to have found out that the magistrates are not only anomalous but something much worse, namely extravagant. The charge in most cases arises from sheer misconception; but the practically important thing is that the charge has been brought. In the case of men who vote away the money of other men to whom they are in no way responsible, a suspicion, even an unjust suspicion, is almost as bad as a conviction. Men cannot in reason be asked to submit to taxation without representation any longer than they choose to submit to it. It is probable then that the present form of county administration will have, at some not very distant day, to give way to the elective board in some shape or other. It is hardly a question whether the change will be for the better or for the worse. When those who are affected by an anomalous institution say that it is not only an anomaly but a practical grievance, the anomaly cannot stand.

We have before now had to speak our mind about the local government of counties, and we shall no doubt have to do so again more than once before the matter is finally settled. Some settlement must be made some time, but the chances of a really good settlement will be seriously endangered if the subject of local government be taken up as an electioneering question for political parties to outbid one another about. The vote of the farmers is already so powerful, the Ballot is likely to make it so much more powerful, that there is the greatest possible temptation for all parties to bid for their support. It is certainly not an agreeable aspect of human nature to hear magistrates, especially Conservative magistrates, disparaging their own order and flattering the prejudices of the farmers, with a view to an expected election. The advanced Liberal is sometimes less zealous for change

on this head than his Conservative neighbour. He has been known to argue that democracy is the right thing where it is to be had, but that, where democracy is not to be had, there is nothing gained by pulling down a better oligarchy to set up a worse. It is quite certain that, as regards the efficiency of public administration, above all as regards the welfare of the classes below both, it would be no improvement to exchange a government of squires for a government of farmers. Some malicious tongues have gone so far as to say that the farmer is produced by keeping the bad side of the squire and leaving out the good. However this may be, it is certain that the tendency of the farmer is to take a breeches-pocket view of everything, to grudge every penny that is spent, to delight in the false economy which makes some petty saving at the cost of really efficient and liberal administration. It is said that some Poor-law Guardians believe that their title means that their duty is, not to be Guardians of the poor, but to be Guardians of the parish purse against the poor. It is certain that it is the hardest thing in the world to make a body of farmers understand that an incompetent officer is far dearer at a low salary than a competent officer is at a high salary.

There is one branch of local administration above all which it will never do to hand over to bodies at all like the present Boards of Guardians. These are the Pauper Lunatic Asylums. Of the two it would be far better to centralize them, to place them, at the risk of any number of outcries, under purely Government management of some kind. We are far from wishing for any such change. All that we can say is that, of two possible changes, this would be the lesser evil. The management of the Asylums at present is somewhat peculiar. A Committee of Visiting Magistrates is appointed yearly by Quarter Sessions; but, when once appointed, they are, for most purposes, independent of the Court. They have on great occasions to come to the Court for money; but in ordinary life they have more to do with the Commissioners in Lunacy. That is, when they have to lay out money beyond the income of the Asylum itself, they have to come to Quarter Sessions for it, while they have not to come, like other Committees, for the confirmation of their ordinary acts. The local public at large therefore hears of them only as spenders of money and has very little notion of what the real work of the Asylum is. In more counties than one an outcry is raised against the extravagance of the Asylum Visitors, which for the most part simply proves the ignorance of those who raise it. We allow that the ignorance itself is often not their fault, but to raise a disturbance about matters of which they are even innocently ignorant is certainly a grave fault. That the general public should know little of the details of Asylum management is a necessary consequence of the form of management which the law has decreed for Asylums. Therefore Boards of Guardians and the like would be better employed in attending to their own duties than in censuring men who are doing their own duties also, though in a sphere which is necessarily less open to the public eye. But it is much worse when a future candidate or his zealous supporters join in the outcry with a view to the next election, or when a nobleman bent on a popular harangue thinks that his nobility exempts him from any need to get up the subject on which he is speaking. The cry of extravagance is of all cries the easiest to raise, unless possibly the cry of Popery. And people raise it as if magistrates, and especially Visitors of Asylums, had some interest in extravagance. From the way in which malcontent Guardians and the like are apt to talk, one would think that the rates went into the magistrates' pockets, instead of the magistrates having to pay them like other people. In matters of expense the interest of the magistrates is exactly the same as the interest of the ratepayers, for the simple reason that the magistrates are themselves ratepayers. Any one who knows anything of the working of Quarter Sessions must know that hardly a penny can be spent without some zealous economist rising to object to spending it. Extravagance is certainly not the fault of a body of men who, if they vote away other people's money, vote away their own also. But it is possible that expenses which seem necessary to those who understand the matter in hand may sometimes seem extravagant to those who know nothing about it.

One point at which the class represented by the elected Guardians are apt to grumble is the salary paid to the Medical Superintendents of the Asylums. A retiring Superintendent gets a pension, or the actual Superintendent gets an increase of salary, and the voices of the discontented are loud against the waste of the public money. It is in vain to tell them what a post that of the Superintendent of an Asylum really is, to tell them of the rare union of intellectual and moral qualities which it calls for, the scientific skill, the tact, the temper, the thorough zeal for his work without which the work cannot be done—qualities which are cheaply purchased indeed at 500*l.* or 600*l.* a year. It is in vain to tell them of the wearing and distressing nature of his duties, of the special need that his work should have occasional breaks, and that it should not—for fear of his own mind giving way—be kept on for any very great number of years together. It is in vain to point out that for this very purpose an Act of Parliament was passed allowing pensions to be granted to officers of Asylums after a shorter term of service than formerly; to show perhaps that the pension complained of might, by the terms of the Act, have been much higher in amount and might have been granted several years sooner. It is in vain to tell them how cheaply the services of a really good Superintendent are bought at the highest salary which any Superintendent receives—to explain the constant, discriminating, and delicate treatment which is needed by patients under the various forms of disease; how many little refinements which to the vulgar eye might seem luxuries are really parts of the medical treatment; how the pictures, the band, the theatre, the chapel with its fabric and services at least up to the standard of a well-ordered village church, all have their direct share in doing the work which the Asylum has to do; how great a power of organization as well as of scientific skill is needed in the man who has to look to all these things and to manage a large staff of inferior officers. All this goes for nothing with men whose one cry is that the thing might be done cheaper. So it doubtless might, if all that is needed were, after the good old fashion, to chain and beat our lunatics, to shut them up in cold and darkness and nakedness. The Guardians could doubtless get that done for a much smaller sum. Or they might doubtless get the parish doctor, for a much smaller increase of his pay, to look in at the Asylum every day as he looks in at the workhouse. Or something might be saved by cutting down Asylum diet to the standard of workhouse diet, the difference between which two standards is shown by the simplest of tests; patients removed from the Asylum to the workhouse always lose in weight, while patients removed from the workhouse to the Asylum always gain. And there is one way perhaps better than any of these for lessening Asylum charges, and for taking away the need for enlarged Asylum buildings—a way which many a grumbling Guardian has in his own hands. No one cause sends so many patients to the Asylum as drunkenness; every Guardian who pays any part of his labourers' wages in drink instead of in money is directly helping to increase the number of Asylum patients, and thereby to increase the amount of Asylum charges and the size of Asylum buildings.

The upshot of all this is that, whatever changes may be coming in the form of the local government of our counties, the Lunatic Asylums at all events must not be handed over to bodies whose spirit and temper are at all like that of our present Boards of Guardians. They cannot be managed under the influence of that hard grudging spirit which forces every penny, either for the proper welfare of the inmates of the workhouse or for the fair pay of its officers, to be absolutely wrung out of it. The way in which the Guardians manage the workhouses, the way in which their complaints show that they wish to manage the Asylums, is proof enough that they must never be allowed to have them in their hands. Under their care the proper medical treatment could never be carried out. No medical man of the class which alone is fit for the delicate work of Superintendent of an Asylum would either take such pay as they would offer him, or would submit to such interference as theirs. Whatever happens, our Lunatic Asylums must not be placed in the hands of men less liberal of money, less able to understand the position and feelings of an able scientific man, than they are now. Local management is no doubt best when fit local management can be had, but if the only form of local management that is to be had is such local management as is likely to be given us by Boards of Guardians or bodies at all like them, the care of our Asylums had better become a direct branch of the business of the central Government.

THE GROCERS AGAIN.

WE gather from some communications which have been published in the *Grocer* that the retail members of that trade are just at present by no means in a happy frame of mind. Even the reduction of the sugar duty does not cheer their drooping spirits. It would seem that they have come to the conclusion that all the world is in a conspiracy against them. The public is very hard upon them on one side, and the wholesale houses are very hard upon them on the other, and then there is the new Adulteration Act to fill up their cup. The Adulteration Act is the newest grievance, and for the moment it produces the loudest outcry. The grocers think it very cruel that they should be required, under criminal penalties, to vouch for the purity of the articles which they offer for sale. They assert, of course, that no adulteration ever takes place after the goods arrive at their shops, but then it is impossible for them to be sure that adulteration has not been previously practised. They do not manufacture or import the goods themselves; they purchase them from the wholesale houses, and they have to trust to those houses to give them an honest return for their money. To the mind of the retail grocer nothing can be simpler or more obvious than that the wholesale dealers should alone be held responsible for the purity of the wares sold in shops. It is conceivable, however, that the wholesale dealers might have something to say in opposition to this proposal. They would naturally object to be made responsible for the character of goods which had passed beyond their control. In many cases they are only importers, not manufacturers; and they, too, are liable to have bad goods passed off upon them when they go into the market. If the retail people had their way, the wholesale houses might find themselves called upon to answer, not only for the quality of the goods as they sold them, but for the quality of the goods after they had gone into the hands of other persons. An impartial public will be disposed to believe that adulteration is practised sometimes by the wholesale dealers, sometimes by the shopkeepers, and sometimes by both in succession. The only way in which adulteration can be effectually checked is to come down on the person in whose possession the adulterated goods happen to be found. It is

true that he may be the innocent victim of an imposition, but he will have an opportunity of proving this, if he can, before he is convicted.

If the shopkeepers will only exert themselves to expose the frauds of wholesale dealers, and to bring the offenders to justice, the public will be very grateful to them; but we are afraid the public can hardly afford to relieve the shopkeepers from all responsibility in the matter. It is not too much to expect that a man who sets up as a grocer should have some knowledge of the articles he undertakes to supply, and should be able to discriminate between genuine and spurious commodities. If he cannot trust his own judgment in every case, a small fee to an analytical chemist will enable him to submit the doubtful goods to an authoritative test. It is much easier for a shopkeeper to test his goods in bulk than for every customer to test them in small quantities; and the practical advantage of the law as it stands is that it puts a certain amount of pressure on the shopkeeper to take precautions on this point which he would be very apt to neglect if he were allowed to transfer all his responsibility as a matter of course to the wholesale houses. Whether goods in the Custom House and in bonded warehouses should not be subjected to a regular system of inspection is a question which certainly deserves consideration. The retailers are of course entitled to the benefit of every protection against the trickery of wholesale dealers which can be reasonably extended to them, both for their own sake and for the sake of the public; and adulteration, notwithstanding Mr. Bright's famous dictum, is really such an abominable kind of robbery that no effort should be spared to track it down and punish it. The Reports which were laid on Tuesday before the City Commission of Sewers contain some rather startling disclosures on this subject. Dr. Letheby, the Medical Officer of Health for the City, lately heard that a thousand boxes of adulterated green tea were being offered for public sale, but the tea was all sold before he could interfere. Samples, however, had been taken and the names of the purchasers obtained. He found that the samples contained from forty to forty-three per cent. of iron filings and nineteen per cent. of silica in the form of fine sand, which had been mixed with the leaves before curling evidently with a view to increase their weight and bulk. After the leaves were curled they were covered with green pigment, and when infused in boiling water they produced "a very turbid solution, offensive to the smell and nauseous to the taste." In another instance Dr. Letheby was privately warned that a large quantity of unsound tea was being hawked about in the City, and on inquiry he found that it was salvage from a wreck. The tea, after having been well soaked in salt water, was dried and otherwise manipulated in order to give it a decent appearance, and was then packed in old tea-chests and stored in a bonded warehouse. All the samples were composed of "exhausted and putrid leaves, and were utterly unfit for human consumption." In a joint Report the Medical Officer and the Solicitor of the Commission have pointed out the difficulties of dealing with articles unfit for food in bonded warehouses, owing to the want of definite, speedy, and certain information of the existence of such articles, and of power to enter the warehouses for the purposes of examination and analysis. They suggest that the Medical Officer of Health or Nuisance Inspector should be enabled to inspect goods in bonded warehouses, and, in the event of their being found to be unsound or impure, to obtain an order from the justices for their seizure and condemnation, or at least for their being held in custody until fully examined.

A meeting was held in London last week at which a number of grocers exchanged views as to the present state of the trade. We cannot say that the speeches which were delivered convey the impression that the grocers have as yet arrived at a very correct appreciation of the conditions under which they have to do business, or of the proper course for them to pursue. But on one point at least they have come to a sound conclusion, and that is as to the advantage of co-operation among themselves. The shopkeepers seem to be becoming resigned to the existence of Co-operative Stores as an inevitable evil, and the only question now is how to compete with them to the best advantage. "A hair of the dog that bit you" is an old prescription to which the grocers appear to have turned in their despair. They have resolved to meet co-operation by co-operation, but it is still uncertain what form their co-operation is to assume. In the first instance, the retailers endeavoured to frighten the wholesale houses into refusing to do business with the Co-operative Stores, and in some instances they succeeded. The only result, however, was that, when one firm threw up a contract under pressure of this kind, there were others eager to obtain it, and the Stores have never found the slightest difficulty in procuring whatever goods they required at wholesale prices. The Stores give large orders and pay cash down, and these are temptations which few traders are able to resist. The retail people are at last convinced of the hopelessness of attempting to prevent the Stores from obtaining wholesale supplies, and have determined to apply whatever pressure they can bring to bear on the wholesale dealers in order to obtain better bargains for themselves. An Association has been projected for the purpose of supplying grocers, oilmen, shipowners, &c., with goods at a small percentage on cost, "to enable them to meet the competition of Co-operative Societies." There is no reason to doubt that an establishment of this kind, if judiciously managed, might prove highly beneficial to the grocers. By uniting in this way, they would enjoy the advantage of making wholesale purchases on a large scale, and of putting into their own pockets a share at least of the profits which at present go to enrich the wholesale dealers. Indeed, even without forming a large association, grocers might, by combining together in small groups, often effect advantageous purchases. They would do well to remember, however, that the success of the Co-operative Stores is entirely due to their strict adherence to cash transactions both in buying and selling; and it is hopeless for the grocers to attempt to compete with them on equal terms unless they are prepared to act on similar principles. We observe in the prospectus of the proposed Grocers' Supply Association that it is intended to allow members to obtain goods on credit to the amount of 100*l.* worth a year for each share held; and here we have at the outset a departure from the ready money system. It must never be forgotten that in one way or another credit must be paid for, and shopkeepers who trade on borrowed capital are necessarily weighted in the race as compared with those who pay for everything in cash. One of the speakers at the meeting at which this project of co-operation was discussed urged that wholesale houses should be "utterly done away with," forgetting apparently that the new association would be only a wholesale house managed by a company. Another grocer, in the course of what is described as "a vigorous speech," thought that his fellow-traders suffered from being "too nervous." His advice was to "put ½*d.* a pound on moist and 1*d.* on lump sugar, and don't be nervous." Some indignation was expressed at the candid admission of the chairman and other speakers that the retail dealers were suffering from the competition of the Stores. One gentleman said he thought it was "showing a flag of weakness before the public to come before them with such associations as this." It was only because the public was so ignorant that it was taken in by the Stores. This gentleman, however, was reminded that mere talking about the Stores would not talk them down. The success of a Grocers' Supply Association would of course depend on the amount of practical experience and sagacity with which it was conducted; but there seems to be no reason why a committee of grocers could not manage such a business as well as a committee of Civil Service clerks. Even if the grocers combined for nothing else, they would do well to combine with a view to protect themselves from having unsound or adulterated goods passed off upon them by wholesale dealers. An organized system of inspection and analysis, with a fund for prosecuting fraudulent merchants, would be as much to their own advantage as to that of the public.

We find in the same number of the paper which reports the meeting of the grocers a report of the annual meeting of the Civil Service Supply Association (Limited). The balance-sheet shows that goods were sold last year to the amount of 371,792*l.*, at a gross profit of 32,000*l.*, which was reduced, however, by working expenses to a net sum of 5,300*l.* The principle is to sell at cost price articles which do not deteriorate by keeping, and which are packed for sale, such as pickles, preserved meats, &c. In other cases a small percentage is added to cover risks and expenses. It is interesting to know that the Association expects to be able to sell sugar at a reduction of a farthing a pound if Mr. Lowe's Budget is carried; so that the gentleman at the grocers' meeting who urged the retailers not to be "nervous" about raising the price of sugar may perhaps find that the competition of the Stores cannot be ignored. If the shopkeepers experience a pang of envy and jealousy when they read the large figures of the Association's balance-sheet, they may perhaps derive some consolation from hearing that the managers of the society are not successful in pleasing everybody. Earnest appeals have been addressed to the Association on the subject of port wine, and they laid down a considerable stock of port in anticipation of the demand from members. The consequence is that they have still a large stock on hand. "If gentlemen," said the Chairman, "will not drink old port wine we cannot keep up the supply," and there certainly does not appear to be any means of compelling gentlemen to drink old port wine if they don't like it. It appears that Mr. O'Dowd also "alluded to the subject of Irish whisky," but his remarks, in consequence of the noise prevailing in the room, were unfortunately lost to the reporters. It would appear that there is a great Irish whisky question as well as an old port question, and another gentleman was very bitter about the "great coal question." A member thought the Stores were extravagant with paper and string, and another demanded a series of detailed accounts showing the precise profit and loss on every article sold in the establishment. The Chairman pointed out that it was by simplifying their accounts as much as possible that the Stores were enabled to do business cheaply, and that the information asked for would add considerably to the annual expenses. On the whole, the Committee seem to have quite enough of questions of one kind and another on their hands, and their moderate allowance of 1,500 guineas to be divided amongst them can hardly be said to have been too easily earned. If a resolution which was carried at this meeting is confirmed by a ballot, the Association will pass into a new phase of existence. Hitherto it has been open to any member of the Civil Service to become a shareholder, but it is proposed that the issue of shares should be stopped, and, if this is agreed upon, the Association will become, in a great measure, an ordinary proprietary business. The profits will belong to the existing body of shareholders, and there are already indications that a conflict of interests may some day arise between shareholders who are anxious for large dividends and members of the Association who are interested in obtaining cheap goods.

RELIGIOUS AFFAIRS IN GERMANY.

THE ecclesiastical contest in Germany has by no means lain dormant, though it seems of late to have attracted less public attention. Both in the political and in the strictly religious sphere events are rapidly advancing, and it remains to be seen whether the two parallel streams which have hitherto run each its own separate course will converge to a common issue. One question on which great stress was laid at the Cologne Congress of last September has, we observe, already come before the German Reichstag, and has been referred to a Select Committee for consideration; that is, the introduction of compulsory civil marriage throughout the Empire. Meanwhile the ecclesiastical Bills of the Government have been passed without any substantial change by an overwhelming majority of the Upper House of the Prussian Landtag. A formal protest has been made by the Archbishop of Cologne, and we presume some similar measure is in contemplation by the episcopate generally, as they have again met at Fulda to seek inspiration at the tomb of St. Boniface. But they sat with closed doors, and as yet no intimation has been given of the result of their deliberations. It does not, however, at all follow that their condemnation of Prince Bismarck's Church policy would represent or evoke the universal feeling of the Catholics, or even of the Catholic clergy of Prussia. And it is certainly a curious fact, if it is correctly reported, that, of some fifty petitions against Dr. Falk's Bills presented to the Herrenhaus, forty-one should have emanated from Protestant congregations. The laity may not unreasonably be disposed to think that a university education is an innocuous, if not positively beneficial, preliminary to the more professional curriculum of candidates for the priesthood. And the clergy themselves, whatever opinion they may hold about methods of clerical training, can hardly be expected to cling with peculiar affection to the arbitrary exercise of episcopal authority, which it is the object of one of these new measures to restrain. It is not improbable, from what is known of their characters and antecedents, that there may even be those among the bishops whose personal convictions are favourable to some part at least of the new legislation, as we know there are those among them who expressed their personal satisfaction at the expulsion of the Jesuits, though they had joined in a corporate protest against it beforehand. The question of the abstract merits or demerits of the new laws is of course quite distinct from the wider inquiry as to the policy or justice of imposing regulations materially affecting the internal organization of the Church, by the exclusive action of the civil power. Into that discussion we need not enter here, further than to observe—what is obvious—that a certain margin must necessarily be allowed for differences of national sentiment and usage, and that it has always been customary for foreign, especially Prussian, Governments to interfere, and to interfere with a high hand, in many matters where any such interposition would be thought intolerable in England. At present, however, we are chiefly concerned with the facts. What is certain is that the four Bills have passed the Herrenhaus, and although a final reference to the Lower House is requisite as a matter of form, it is expected that they will have received the Royal assent and have become part of the law of Prussia by the end of next week. The further step of extending their obligation to the whole German Empire can hardly be long delayed, and already Bavaria and some of the other smaller States are preparing to adopt it on their own account without waiting for the action of the Imperial Diet.

The expulsion of the Jesuits, though it raised less violent opposition in Ultramontane circles than the directly ecclesiastical measures since introduced, is, as we have before pointed out, still more difficult to defend on grounds either of justice or expediency. And the Report just presented by the Committee appointed by the Diet to ascertain the exact sense of the clause which includes all societies "related to the Jesuits," without naming them, in the sentence of banishment, extends the scope of the measure far beyond what had appeared to be its original limits. Not only are certain small congregations regularly affiliated to the Jesuits put under ban, but all communities which share what the Committee have defined to constitute the leading characteristics of the Jesuit Order are also to share their fate. These characteristics are stated to be three—namely, the aiming at a universal spiritual despotism, the internal centralization of discipline organized with this object, and universal extension to all parts of the world. The two former peculiarities may fairly be allowed to distinguish the Jesuits, both in fact and in the intention of the master mind which planned the system, from the older religious corporations in the Church. But if they have been more successful in extending their operations over the world than their older rivals in the field, this is mainly due to their superior organization and unity of aim. The Dominicans and Franciscans are not less cosmopolite in idea than the Jesuits, and for three centuries before the Reformation the Franciscans were the great missionary power of the Latin Church, just as the Jesuits have been for the three centuries since. However, the Committee have reported that by the application of these tests the Redemptorist and Lazarist Fathers must be held to be included in the scope of the law, and they will accordingly, we presume, be banished from German soil. This rough and ready method of expelling Ultramontane influences "by a fork" can hardly fail to suggest to a looker-on the probability that, like similar methods of expelling nature, it may lead to a reaction. Downright persecution of this sort (we are speaking now simply of the Jesuit law), unless it is very thorough indeed—more thorough than is well possible in this nineteenth century—usually defeats itself.

It would be an interesting inquiry, if there were any sufficient data to rely upon, what effect recent changes will have, at the present very critical epoch in the history of the Roman Catholic Church, on the future of German Catholicism, and how they will be received by the two great sections into which it is at present divided. There is little in Prince Bismarck's policy which the Old Catholics would not hail with satisfaction; most of it, including the proposed establishment of civil marriage, is virtually the carrying out of their own professed programme. But will the Ultramontane majority passively, however sullenly, acquiesce, or are we to look for a kind of religious civil war, if such a phrase may be allowed? We have seen already that a large number of Protestant petitions against the new laws was presented, and it has been asserted that the majority of the "Old Lutherans," or what may be called in English phraseology the High Church section of the Evangelical Church, will side with Catholics in their resistance. It may be so, though we do not feel by any means sure of it. Neither indeed can it safely be assumed that the Catholic opposition will take any very determined shape, notwithstanding the fiery language addressed by the Ultramontane *Germania*, in a kind of editorial allocution, to the assembled bishops at Fulda. The modern State is first identified with Satan saying to the unchangeable Church, "All this I will give thee, if thou wilt fall down and worship me," and is soon afterwards, in a peroration more sonorous than strictly intelligible, somehow metamorphosed into a combined embodiment of Judaism and heathenism, whose oppressive gloom is at last to be triumphantly dispelled by "the eternal sunlight of Christianity." But the Ultramontane journals, both in Germany and elsewhere, are much addicted to what the Americans call "tall talk," and there is another passage in this same article which may suggest a different conclusion from that intended by the writer. He observes, with perfect justice, that "immense sacrifices will be demanded" of those who are resolved to resist the action of the State, and then adds—what is by no means equally clear—"as is always the case, these sacrifices will be made." But that depends entirely on the earnestness and strength of conviction of the Ultramontane party, and some of those who are best acquainted with the internal condition of religious parties in Germany do not at all believe that Ultramontane earnestness will stand the crucial test of sacrifice. There, as elsewhere, the infallibilist ranks are demoralized by a secret indifferentism, if not scepticism, which is entirely consistent with very loud talking while talking only is required, and is even likely to promote it, but is not at all likely to inspire vigorous action or patient endurance of serious trial and discomfort. Meanwhile, however, the State does not appear to be particularly firm in its support of the Old Catholics. The other day the parishioners of Hirschberg, in Silesia, elected an excommunicated Old Catholic priest, Dr. Hassler, as their pastor, to whom the Bishop of Breslau of course refused institution; and on an appeal to the Government the Bishop was supported in his refusal, and a second election was ordered to be made. In Switzerland, however, the movement seems to be carrying all before it, and even the eccentricities of Father Hyacinthe, who was invited by an indiscreet minority to Geneva, have not seriously retarded the growth of a large and increasing party of *bonâ fide* Catholics who openly repudiate infallibilism.

In Germany there has been an important Old Catholic meeting held at Bonn, under the presidency of Dr. Schulte, who has migrated from Prague to the banks of the Rhine, and now holds a professorship in the northern University. It was decided that the annual Congress should be held next September at Constance, where two Old Catholic congregations have been established, but the main object of the meeting was to elect a bishop. And about this some hitch seems to have occurred. Dr. Döllinger was understood to be opposed to the step, as unnecessary, or at least premature, and two of the most distinguished leaders of the movement, Reinkens and Reusch, whose names have been in everybody's mouth during the last twelvemonth as the future nominees, have declined the office. In Reinkens's case a sincere diffidence as to his own qualifications was unquestionably the controlling motive, but Reusch is said to have also expressed doubts of the wisdom of making any appointment at present. The scheme, however, has not been abandoned, and the 4th of June is now fixed for the election of a bishop, whose salary was announced to have already been secured. And when the bishop is elected and consecrated (by the Archbishop of Utrecht) a synod is to be held, and a plan of synodical action, drawn up by a Committee of the Cologne Congress, will be submitted to it. There are obvious reasons to account for even the warmest supporters of the cause shrinking from what must inevitably be a difficult and trying, and may not improbably prove a somewhat thankless office. But, on the other hand, it is not easy to see how the movement is to hold its ground at all, for any time, even allowing it to be a strictly provisional arrangement, as Dr. Döllinger insists, without any bishops; and it is plain that if bishops there are to be, whether one or more, its future success will very materially depend on the wisdom displayed in their selection. Both Reinkens and Reusch are men of great learning and sober judgment, besides being earnest and eloquent speakers; but an episcopal firebrand might easily do more mischief to the cause of which he had become the official representative than all its episcopal opponents put together, and even a respectable nonentity might very seriously discredit it. The Old Catholics may

perhaps be disposed to regret that Schulte himself, whose tact and power have been shown to be fully equal to his evident intensity of conviction, happens to be a layman and a married man. It is not, however, our business to speculate on the chances of the approaching election, but we shall look with considerable interest to the report of the meeting to be held at Cologne on the 4th of June. The little Church of Utrecht has hitherto presented the sole example of a Latin episcopate repudiating the modern encroachments of the Papacy, and the desperate attempts which have been made from time to time to suppress it by artifice or by force are a measure of the gravity of such a phenomenon in Roman eyes. But the Archbishops of Utrecht have studiously maintained an attitude of purely passive resistance, and the community they rule over is neither a large nor an increasing one. An Old Catholic bishop in Germany could not fail to be brought into direct and active antagonism with the upholders of the Vatican decrees.

THE ROYAL ACADEMY.

II.

THE French critic, M. Beulé, begins one of his thoughtful essays with these words:—"The return of the Exhibitions is looked to as a fête—a fête of intelligence and of taste, and yet, notwithstanding, art is lost." He then proceeds to examine the causes why exhibitions do not arrest, but, according to the opinion of some, actually accelerate, the decadence of art. In England we certainly have an interest in ascertaining how it came to pass that a period of decadence at once set in when the Royal Academy gained power and position by the possession of Burlington House. That the present Exhibition should show steady and continuous decline is all the more anomalous inasmuch as there are reasons why a revival might have been anticipated. One cause of the falling away within the last few years is but too common in the experience of all intellectual movements, whether in art, science, or literature. The transition is always critical and sometimes fatal between one generation and another; the chasm which lies between men who, amid crowning works, have been gathered to the last garner, and their unaccredited successors, it is often impossible to fill up. The Academy has suffered losses which it is difficult to make good; the death of such painters as Maclise, Phillip, Creswick, and Mason leaves blanks which must long be felt. And then, in addition to these losses, there comes in the course of nature a continuous falling away; men who once worked hard and well reach the time of life when they take things easily. And unfortunately it has so happened that at this juncture the younger and rising generation is scarcely strong enough to bear the heat and burden of the day. Hence for the moment the Exhibition is without leading spirits and governing powers; but that this period of interregnum will be of long duration there seems to be no serious ground for fear. Talent is cropping up even in obscure places, and good honest work is pressing forward; moreover there appears to be a sincere desire on the part of the Academy to afford to men of promise a chance of making themselves known. But, reverting to the dangers which M. Beulé sees in the present system of exhibitions, we may mention an evil which at this moment specially besets the Royal Academy. Instead of being sustained by the State, it is an institution actuated by individual motives, and private interests, it may be feared, prevail over the public good. Accordingly these exhibitions, in default of authoritative and intelligent control, are a compromise of parties, a kind of give and take, a foregone conclusion in favour of friends who are kindly allowed to get a good turn. All this is so much the way of the world in every profession that no one in particular can be blamed, and yet the result is a confusion little short of calamitous. The exhibition becomes a medley, mediocrity in the majority puts talent into an eccentric minority, the tares grow up and choke the wheat. Galleries thus arranged are often the reverse of educational; indeed they sometimes sanction with authority works which the public should be taught to despise. It seems one province of contemporary criticism to strike the just balance, to supply as it were a *catalogue raisonné*, and to point to the causes which may be tending to the advance or to the decline of our English art.

The largest picture of the year is dedicated by Mr. Poynter, A.R.A., to the "Dragon of Wantley" (541); the legend has been set forth at length in the *Percy Reliques*. The incidents in this particular legend do not materially differ from the usual routine of these stories; the dragon, as a matter of course, has committed outrages, and the people in consequence are supposed to have fled for succour to a gallant knight, who, having chosen with care his armour, has been dressed for the fight by a young damsel. The typical form of these romances is of the more importance inasmuch as Mr. Poynter is understood to be engaged on four bulky dragon pictures, of which this is only the second; the story of "Perseus and Andromeda" having last year furnished him with an introduction to the series. In the present instance the spectator may imagine himself near a Yorkshire village called Wantley, within a mile of the seat of the late Mr. Wortley Montagu. The spot chosen is a wooded and rocky headland which overlooks a wide sweep of hill and dale, a line of country common to Yorkshire. As we stand before the picture it would appear that the painter has been careful to reproduce the actual scene associated with the song, and assuredly no locality could be better suited to his purpose. Grandly conceived are the tree trunks which assume tragic contortions as if in response to the dragon's writhings; and the dragon himself, described in the poem as of "furious wings," "long claws," and "jaws of four-and-forty teeth of iron," rises to the nobility which distinguishes the higher order of dragons from the meaner and more extravagant of the species. Mr. Poynter has greatly improved on his dragon of last year, which was a raving vulgar monster; now he comes more near to the Turneresque idea, which is the noblest conception of a dragon known to modern times. "More of More Hall," the "peerless knight of these woods," is seen with arm and sword raised ready to give the final thrust. The drama sustains its action well, the drawing is firm and true. Perhaps to the general public the style may still seem rather dry and hard; yet the grand treatment of the lines, and the solemnity of the colours, show that Mr. Poynter in his eclecticism has not excluded Titian from his studies.

Mr. E. M. Ward, R.A., has a powerful composition, "The Eve of St. Bartholomew" (207). Admiral Coligny, after the attempt to assassinate him before the massacre, is visited in bed by the King, Catherine de Medici, and the Duke of Anjou. The situation is striking, and the figures have a dignity befitting historic art; yet they would appear to more advantage if less heavy and dark; the colours, too, might be improved by the presence of quiet and retiring greys in the place of hot pigments. But the artist has evidently been ready to sacrifice much to manly strength. Mrs. E. M. Ward finds a congenial theme for her dexterous pencil in the "marvellous boy" Chatterton (361). Known dates indicate an age of only thirteen; in other words, this picture is four or five years prior to the closing scene in Mr. Wallis's well-known picture, "The Death of Chatterton." The Bristol Bluecoat schoolboy had, in fact, not as yet published a line, yet here in a little garret, with the tower of Redcliffe within sight of the window, we see, by the presence of parchments, papers, and pounce-bags, the resolve to forge a way to renown. The foster-mother of the poet schoolboy disturbs him at his work; he complains, "You are too curious and clear-sighted; I wish you would bide out of the room. It is my room." Evidently here was a capital subject for a picture; yet we incline to think more might have been made of it if a crouching or bent-up attitude had not been given to the hero, who thus appears diminutive and almost insignificant. The axiom of Du Fresnoy might, we think, have been remembered with advantage, that the hero of a composition should meet the eye fair in the front, in all the blaze of light. Yet the story is pleasantly told, and the picture capitally painted, especially in its realistic details. Indeed the artist has been so careful of local circumstances that the work may be accepted almost as an historic record.

Some few religious pictures may be mentioned in addition to those which we ventured to condemn in our introductory notice. "Christ's Reproof of the Pharisees" (187) is not the best work we can recall by Mr. Armitage, R.A.; the manner, though simple enough, is dry and hard; the figures of Christ and the Apostles, though not without dignity, have no approach to the divine. Mr. Herbert, R.A., seems to fall into an opposite extreme when he throws spasmodic emotion into the figure of "St. Mary Magdalene at the Foot of the Cross" (302). Mr. Herbert has studiously qualified himself for these sacred themes, and if to eschew what may be termed "the fleshly school" of painting, and to give, in lieu of warm flesh, cold stone and hard wood, be the vitality of spiritual art, then must he rank as one of the foremost of religious painters. Mr. Herbert has certainly a right to boast that his impersonation of the Magdalen is the reverse of that of Titian; indeed he probably would prefer to find himself side by side with Ary Scheffer, who, when affecting spirituality, thought it but fitting to be colourless. Mr. Watts, R.A., we may be sure, paints on the converse theory, as may be easily seen in his figure of "The Prodigal" (281). Here, instead of pallor and poverty of pallet, is power of colour and impasto. But diversity in the treatment of Biblical subjects is not only allowable, but even imperative; the assumption has been too often tacitly made that a painter is bound to impart some undefined religious aspect to every character taken from the Old or the New Testament, whereas there are many personages—such, for example, as the Prodigal Son—who can have no claim to the privilege of religious treatment. In like manner, "After the Expulsion" (282) is not necessarily a theme for religious sentiment; accordingly Mr. Elmore has been content to depict Eve merely as a noble and beauteous form of humanity; the light of the countenance is shadowed by dark destiny as the mother of our race, fairer than all her daughters, wanders with an infant on her shoulder into the wide world shelterless. The accessory figures compose grandly and complete the story. The painter has been studious of his types, and if there be still the possibility of a high art among us, noble generic types wherefrom accident and blemish are eliminated must once more claim a first care. Mr. Dobson, R.A., has long laboured in the direction of ideal art, but in such works as "St. Paul at Philippi" (291) the misfortune is that, in seeking his type, he eliminates and refines away so much that in the end there is little or nothing of nature left. Here "a certain damsel" could scarcely have lost her wits, because it is but too obvious that she never had any. Painters, like other people, fall into the error of supposing that the road to religion lies across a prostrated intellect, whereas some of the finest brains ever seen in life or within the sphere of art are found in the sacred works of the Old Masters.

Mr. Alma Tadema apparently holds the opposite conviction that Biblical painting may be all the better for weight of intellect.

"The Death of the Firstborn" (1033) is terrific in intensity. The scene has been laid in one of those Egyptian temples familiar to all travellers when in ruin, but here restored with archæologic care, both architecturally and ritually. The death of the firstborn has filled the shadowy fane with wailing, hooded figures like spectres from tombs raise hand and voice, and musicians with strange instruments faintly seen by fitful lights swell the lament. In front of the spectator one of these firstborn in the prime of youth is stretched on the knees of a stately creature, who may be taken for the King. "And it came to pass that at midnight, the Lord smote all the firstborn in the land of Egypt, from the firstborn of Pharaoh that sat on his throne, unto the firstborn of the captive that was in the dungeon." The mother throws herself on the dead body of her son. This picture has its faults. Alma Tadema, of Northern descent, has no Venetian blood in his veins; his handling and his colour when compared with Italian methods are heavy and opaque; and, following this line of thought, a logical necessity might compel us to deny to him the faculty of imagination, which in the history of pictorial art has proved itself supreme only in Italy. And yet this Dutch painter—a pupil of Baron Leys, and now a naturalized British subject—produces from time to time works which give to imagination a more extended sphere. Indeed a new problem is here presented to us; we seem to have arrived at a point where imagination can recommend and reconcile itself to a realistic age only on condition of becoming real and actual. The general conclusion to be drawn from the most successful pictures of the year seems to be that the time is past when artists could safely build on the ideal according to the traditional meaning of the term; pictures reared on this unsubstantial basis are as houses built on the sand. And yet the only great future for art is, as it always has been, in the direction of the ideal. Nevertheless, experience within the Academy seems to prove that, unless an English painter can produce his ideal out of an English peasant or out of an English pastoral scene, he may possibly deserve promotion to some other planet, but will have very little chance of getting upon the line of the Academy.

HAMLET AT THE CRYSTAL PALACE.

THE weakness of the modern stage is proved by the contrivances which are adopted to conceal it. Admit all that can be said in favour of Mr. Tom Taylor's supposed improvements upon the stage traditions of *Hamlet*, and we still feel that a little good acting would be worth them all. We learn from the columns of a newspaper that the costumes have been correctly designed after examples of the thirteenth century; and we are tempted to ask, What of that? The characters of this play belong to Shakspeare's own time so far as they belong to any time. The manners and the talk of Hamlet and Horatio are those of gentlemen to whom the rapier and dagger were familiar, and it is a mistake to carry accuracy of detail so far as to dress Hamlet and Horatio in gowns which would have been sadly in their way if they had attempted to use these weapons. In seeking a representative of Hamlet it might be useful to remember that "the courtier's, soldier's, scholar's eye, tongue, sword," are all among his attributes, and his skill in the use of arms is not only talked about, but actually exhibited. Nature alone gives genius, and time is necessary for study; but a young actor who undertakes Hamlet ought at least to make himself as perfect as possible in those parts of his business which must be learned in youth, if they are to be learned completely. Aspirants to the tragic stage may usefully remember how much labour was gone through by those who in former times attained its highest honours. Charles Kean, who played Hamlet within the memory of many of us, was remarkable for attention to the mechanical parts of his profession, and in this respect he may be recommended as an example to Mr. Tom Taylor's novice. It is rather surprising that a pupil of eminent French teachers should be deficient in any of the accessories of good acting. The use of the sword is still taught in Paris, and it is a necessary accomplishment in an actor who is to play Hamlet. It is quite true that there are few persons in any theatre who can distinguish good fencing from bad, but everybody can appreciate that grace and dignity of bearing which the careful practice of fencing was formerly thought likely to confer.

It is almost ungrateful to criticize with any severity an attempt which is honestly directed towards the improvement of our stage. Mr. Tom Taylor is entitled to the approval and sympathy of all who care for the future of dramatic literature or art. We could wish, indeed, that there were less call for sympathy and more for congratulation. It is enough to break the heart of any manager to see his audience gradually melting away as the play which he has so elaborately produced draws to its close. But we doubt whether John Kemble himself, in the churchyard scene, could have kept some of last Saturday's audience at the Crystal Palace from their dinner. It was probably not foreseen that the play would last nearly four hours; and there are only certain trains by which visitors from London can return, and if everybody waited until the end of the programme, the train would be inconveniently crowded. Still it is strange that there should be a play good enough to see and yet not good enough to see the whole of. Perhaps it might not be amiss to consult the convenience of people who dine at seven o'clock by beginning on alternate days with the fifth act and playing backwards, so that the whole play may be seen at two sittings. There have been cities in which the theatre occupied the most important place in the social arrangements of the day, but certainly London is not such a city. If Shakspeare is played in the evening people will not come, and if he is played in the afternoon they will come, but will not stay. If anybody said that three hours is enough of such entertainment as Mr. Tom Taylor provided last week, the remark would be undeniably true. The gentleman who acted Hamlet lost in physical power as his task proceeded, and certainly he gained in no other respect. The churchyard scene is ineffective, and the numerous deaths upon the stage make the last scene, even with the best acting, slightly ludicrous. In one respect the directors of the Crystal Palace may be congratulated. They undertook that "the smaller features of this great drama" should be completely represented, and in this they have succeeded.

It is, indeed, difficult to feel sanguine as to the results of Mr. Tom Taylor's undertaking. But, as he has leisure and ability, it is to be hoped that he may receive encouragement to persevere in it. The ample space of the Crystal Palace may perhaps afford a corner for the poetic drama; and if a good school of acting could be established there, the stage in London would be improved by it. But probably Mr. Tom Taylor, like other eminent artists, can only be had on his own terms. If he directs, others must obey; and we may suspect that the company he has collected is not absolutely the best that could be got, but the best that was willing to accept his instruction. The public, however, is not likely to be satisfied unless the best is done that circumstances admit. If there be a good actor able and willing to play any part, let him be engaged; and, on the other hand, let Mr. Tom Taylor be as far as possible at liberty to arrange minor details as he pleases. He points out in a note to his edition of *Hamlet* that the style of Osric's talk is a caricature of the euphuism of Shakspeare's day. This caricature would surely be made more complete by dressing Osric in the fashion of the same age. The gravediggers are unmistakably English of the same time, but the dresses of humble people do not vary much in successive ages, and Mr. Tom Taylor may say if he pleases that his gravediggers are of the thirteenth century. It might be interesting to consider how far this modern strictness as to costume is to be carried. Let us make the improbable supposition that *Troilus and Cressida* were revived. It would be a manager's obvious thought to claim credit for being strictly classical, yet the heroes of Shakspeare, although they bear Greek and Trojan names, would be much more at home on a mediæval battlefield than on the plain of Troy. But when Shakspeare thought it worth while, he could fix the time of a play, and make his characters keep to it in their talk. This is notably the case with *Julius Cæsar*, which contains very few expressions unsuitable to the manners of ancient Rome. Where Shakspeare has not attempted this accuracy, he probably did not think it worth while, and he was a tolerably good judge. He certainly has not attempted to fix the characters of *Hamlet* to any particular age, and the reason probably was that he had not made up his mind to what age the story of the play belonged. Indeed, if Mr. Tom Taylor is right in saying that the play was taken from a novel "founded on incidents in the mythic annals of Denmark," it is useless for us to attempt to arrive at greater certainty than Shakspeare possessed. We should say, let the dresses be handsome and harmonious with the acting, but do not place a manager in fetters from which the author kept himself free. As regards the dress of Hamlet himself, we should be satisfied without any improvement upon the well-known picture of John Kemble. The cloaks which Hamlet and Horatio wear deserve the denunciation of a German emperor of the selected period as serving neither for ornament nor use. They are too scanty for warmth, and yet long enough to impede motion. But if accuracy of detail were so very important as Mr. Tom Taylor thinks, it might be worth while to remark that Hamlet and Horatio appearing on the platform at Elsinore on a frosty night ought properly to be wrapped in cloaks capable of producing warmth.

We have dwelt thus at length upon this matter of dress because Mr. Tom Taylor has challenged attention to it, and we think that in the too eager pursuit of accuracy he has fallen into a serious mistake. "The phrase," says Hamlet, "would be more german to the matter if we could carry a cannon by our sides." This single sentence seems sufficient to prove our case against Mr. Tom Taylor. The character of Hamlet belongs to all time, and the circumstances of Hamlet belong to Shakspeare's own age. In the thirteenth century a duel between gentlemen, if fought on foot, would have been fought with sword, or axe, and shield. This is well shown by Laertes, who desires to refer his quarrel with Hamlet to "some elder masters of known honour," in accordance with the usage of polite nations at the time of writing. In Shakspeare's age the dagger was used in the left hand to parry thrusts made by the rapier held in the opponent's right hand. Captain Bobadil shall teach us how to use them.—"Exalt not your point above this state, at any hand, and let your poniard maintain your defence thus!" At or after Shakspeare's time duels began to be fought with the rapier alone, and it was doubtless common in his time to fence with rapiers having buttons on the end, or "foils." The substitution of rapier and dagger for broadsword and target was lamented by writers who saw in it a proof of the degeneracy of the age. In a comedy of 1599 the complaint occurs—"Sword and buckler fight begins to grow out of use. I am sorry for it. I shall never see good manhood again. If it be once gone, this poking fight of rapier and dagger will come up; then a tall man and a good sword-and-buckler man

will be spitted like a cat or rabbit." We take this quotation from a note by Scott on that passage of the *Lady of the Lake* which describes the combat between Fitzjames and Roderick Dhu. Scott knew all about these things, and he had not omitted to consult in reference to them a book called *Illustrations of Shakspeare*, which is probably too old-fashioned to deserve Mr. Tom Taylor's notice. Yet the gradual disuse of armour is one of the most important features of Shakspeare's age, and this feature inevitably appears in any play which reflects the manners of that age. But ever since Mr. Fechter thought proper to play Hamlet in a yellow wig because he was a Dane, we have been overdone with details which, even if correct, have been unnecessary.

Let us not, however, omit to acknowledge the good which Mr. Tom Taylor has done by putting *Hamlet* into the hands of many hundreds of visitors to the Crystal Palace, and causing them to read it. Some of his remarks are valuable, and we particularly approve the note in which he dwells upon the "wonderful impressiveness and significance" of the opening scene of the play. It is difficult to complain of any excision of the text when Mr. Tom Taylor's abridgment occupies nearly four hours in performance; but we think that the sort of audience likely to be found at the Crystal Palace would appreciate the speech of Marcellus which refers to Christmas. The preface mentions that Mr. Tom Taylor did the work of excision himself, and found on comparison, as we can well believe, that the result agreed nearly with that stage edition which has been produced by three centuries of experience. Yet the wealth of Shakspeare's mind is shown by these cuttings of the diamond. Among them are the lines which teach that excessive grief for a father's death is opposed to reason, which still hath cried "This must be so." There are no lines in the play by which an audience would be more nearly touched. We think that Mr. Tom Taylor's exegesis of the word "cousin" in the last line of this speech verges on absurdity. The discovery that this word is addressed to Hamlet, and not spoken of him, reminds us of the discovery of another ingenious commentator, that Desdemona applies the words "My lord" to the Duke, and not to her husband. Some critics are too fond of a process which may be described as measuring a giant to a hair's breadth. However, on the whole we are content with Mr. Tom Taylor's work, and as the audience, or what remained of it, called for "author," we presume that they also were content with it. To prevent disappointment of future audiences, we may mention that the ghost of Shakspeare did not appear in answer to this call. The best that can be said of the performance is that it gained some genuine applause, which was particularly bestowed on the scene in the Queen's closet. The ghost was mechanically excellent, but we have heard much better elocution. It is quite possible that the actor of Hamlet may improve as practice gives him power and confidence, and by all means let him have a full and indulgent trial. The Directors of the Crystal Palace may usefully revert to that mission which they originally undertook of educating the people, and thus they may more effectually compete with the rival establishment at South Kensington. If they can collect an audience for young actors who will do their best in Shakspeare, both actors and audience are likely to be improved in the process. We cannot help remembering that one of the most recent aspirants to the part of Hamlet in London was a lady, Miss Bouverie, whose performance would compare favourably with that of last Saturday. We make this remark without the least desire to see this lady or any other in the part of Hamlet. But if these performances of Shakspeare should continue, as we earnestly hope they will, we think that all rising talent should have a chance. The public, we are sure, will allow handsomely for early difficulties, and will be especially generous to that diffidence which is so often combined with noble aspirations and latent talents of the highest order. We have briefly recorded our impressions of last week's performance, not forgetting, however, that it was the first attempt of a difficult task. It is only necessary to add that every person who feels any interest in the poetic drama should see the play of *Hamlet* at the Crystal Palace, remembering during the performance Hamlet's own precept as to the treatment of the players.

REVIEWS.

DR. MANSEL.*

HENRY LONGUEVILLE MANSEL, we imagine, will not be very long remembered as Dean Mansel. His best and most valuable work was done before he became Dean of St. Paul's; and his claims to that high office were of a general rather than a special nature. He was a metaphysician essentially, a theologian only accidentally; and his theology was not of what is sometimes supposed to be the genuine decanal type. A theory survives in some quarters, though it is grounded on instances of not the most recent date, that a deanery is just the position for a dangerously original divine. Originality in an incumbent, or even in a canon, is generally out of place. It is not understood by the occupant of the next living or the next stall; it is suspected by the archdeacon, and possibly snubbed by the bishop. Moreover, it cannot be quiet under such circumstances; it is a pent force, like that which causes the earthquake, and must work its way out somehow. Originality in a bishop is not like an earthquake, but like thunder and lightning. Whatever its value, it cannot be equally distributed through the length and breadth of a diocese; it runs rapidly along congenial substances, but does mischief among non-conductors; instead of warming and cheering, it flashes and fulminates. But an original dean is a comparatively safe person. He can develop himself without coming into unpleasant contact with either his equals, his inferiors, or his superiors. No one is obliged to read his books, very few persons are under the necessity of hearing him preach; he is entrenched against the bishop; he deals with the canons, for the most part, one at a time; and his cathedral, in the course of its existence, has heard much stranger sentiments than he is at all likely to utter. But Mansel's claim to a deanery was certainly not the abnormal nature of his opinions. He was orthodox in the highest degree—more orthodox, indeed, than men who, like him, are at once able, inquiring, and honest, can generally contrive to be. The cast of his mind led him to dwell, not on theology in itself, but on theology in its relation to philosophy. His power of mind was such that he was likely to do well whatever he attempted; yet we may be well acquainted with his writings without being able to conjecture what distinctive features he would have contributed to the Speaker's Commentary as a commentator on the Gospels of St. Matthew and St. Mark. His Bampton Lectures are his most important effort in the direction of theology; and their negative character is sufficiently indicated by their title—"The Limits of Religious Thought examined." Philosophy was employed in the lectures not to investigate thoroughly a certain field, but to disable other forms of philosophy from entering upon it; and the limits of religious thought were examined as contrasted with its contents. What is perhaps more remarkable, there is an absence of originality in Mansel's philosophy as well as in his theology. He has ventured on the prophecy that, if ever the time shall come when the philosophy of the Conditioned shall occupy its fitting place as the handmaid and auxiliary of Christian truth, the name of Sir William Hamilton will stand, most consulted and most revered, among the fathers and teachers of that philosophy. The prediction is made in a hypothetical and guarded form, which will in all probability prevent it from ever being brought into contact with the severe test of fact; but, of the thinkers who have any confidence in its ultimate fulfilment, few indeed would be inclined to modify it by substituting the name of Mansel for that of Hamilton. Mansel applied with great ingenuity and perseverance a metaphysical system which he modified very little. He showed himself a model disciple, and did not aspire to be a master.

The volume of Mansel's minor writings, which has been carefully edited by Mr. Chandler, consists for the most part of articles, lectures, and letters, relating either to philosophy as a separate subject, or to philosophy in its bearings on theology. Two articles on Sensation Novels and Modern Spiritualism, which were contributed to the *Quarterly Review*, are in a lighter strain, and an article on Freethinking, which appeared in the same Review, is exceptional, as being of an historical cast. We have also the witty dramatic fragment, *Phronêsterion*, which was called forth by proposed changes in the constitution of the University of Oxford, some of which have now become historical facts, and have so passed out of the jocular region. With the exception of an unfinished article on the Idealism of Berkeley, all the papers are earlier in date than Mansel's appointment to the chair of Ecclesiastical History. It would seem that the intellectual energy which made comparatively light of metaphysics was for the time absorbed, first by the novel duties of a not very congenial professorship, and afterwards by the practical work of a deanery—work which is easy enough on paper, but is sometimes found to absorb, in the case of a beginner, a great deal of time and attention. We may suppose that Mansel's literary activity was just resuming its accustomed play when he was removed by an untimely death.

The papers now before us, though for the most part familiar to readers who have cared in former years to follow the course of Mansel's mind, supply in their present form a collection of material which brings vividly before us his characteristics as a thinker. Few men indeed have known metaphysical science so well, used it so freely, and trusted it so little. In spite of their form, Mansel's intellectual attempts were the reverse of ambitious; he was like the defender of a besieged city who tries to drive back assailants with weapons snatched from their hands, and whose ingenuity is chiefly shown in meeting contrivance with contrivance. He never yielded to the fascinations of those great schemes of intellectual conquest in which the majority of young metaphysicians indulge as a matter of course. He had a special faculty for abstract reasoning, but nothing could be more moderate than his estimate of what it could accomplish. The duty of philosophy, he said, is not to transcend consciousness, but to make consciousness at unity with itself; the office of philosophy is but the articulate expression of consciousness. The thesis which he maintained in his inaugural lecture as Professor of Metaphysics was that psychology is the test of moral and metaphysical philosophy; and before the lecture was concluded, he told his hearers that, by means of a cautious psychological procedure, they might hope either to lay a foundation in facts for the construction of a metaphysical system,

* *Letters, Lectures, and Reviews, including the Phrontisterion, or, Oxford in the Nineteenth Century.* By the Very Rev. Henry Longueville Mansel, D.D., sometime Fellow and Tutor of St. John's College; Wayneflete Professor of Moral and Metaphysical Philosophy, Magdalen College; Professor of Ecclesiastical History; Canon of Christ Church, Oxford; and Dean of St. Paul's. Edited by Henry W. Chandler, M.A., Fellow of Pembroke College, Oxford, and Wayneflete Professor of Moral and Metaphysical Philosophy. London: John Murray. 1873.

or at any rate to show why such a system could not be constructed, and what is the origin and real meaning of the delusion which has led men to dream of its possibility. That no manipulation of mental facts can enable us to transcend consciousness is the conclusion to which many sensible men have been led by the study of mental science. When they have reached it, they leave off thinking about thought, and choose some other employment for their minds; and it is certainly strange to find a young metaphysician, with a whole world of speculation before him, accepting as an important truth what they have found so discouraging. The terminology of which Mansel was a master, and to which for some purposes he trusted, was originally meant as the scaffolding of a bridge that was to connect the world of being with the world of knowing. We may be quite sure that it was the hope of real discovery which led the fathers of speculation to leave common sense behind, and trust themselves to a restless sea of abstractions. Even now it seems to many of us that it is the peculiar privilege of earnest thought to be in some way superior to its premisses; to guess, to muse, to meditate, to dream, yet possibly to verify the dream after all. Intellectual enthusiasm, like strong affection, seems to carry us out of ourselves to an object. The ardent metaphysician has a faith which is to him like that of religion, the substance of things hoped for, the evidence of things not seen. To such ardour Mansel could give but scanty encouragement. The very words with which he recommended the study of metaphysics sound almost like an apology for failure. He told the learners who came to listen to the first burst of his professorial energy that metaphysical inquiry, whether it succeed or fail in its ultimate object, cannot be otherwise than a wholesome and instructive discipline of the mind; like the labourers in the fable, its votaries may not succeed in finding the buried treasure for which they turn up the soil, yet their labours will have prepared the intellectual field for its proper harvest, and they may hope to attain a knowledge more valuable perhaps than that for which they sought—a knowledge of themselves and of their powers, of what they may and what they may not aspire to know, of the laws and limits of reason, and, by consequence, of the just claims of faith. Good sense, no doubt; yet it is a poor recommendation of a study to begin by depreciating its powers; to hint that its bow will not carry far, nor its arrow hit the mark. It is a very peculiar intellect which can work on indefinitely in the dim hope of finding something which it does not seek, and of attaining at last to the measure of its own incapacity.

It would seem at first sight that Mansel did not take the same depreciating view of logic as of metaphysics. For formal logic, at least, which rejects all empirical elements, he has high terms of praise. All formal thinking, he tells us, is governed by laws which may be expressed in analytical judgments, while all material thinking is governed by laws which may be expressed in synthetical judgments. The former are uniform in their operation, and can therefore completely guarantee the validity of thought; the latter are modified in their operation by their combination with experience, and can therefore only partially guarantee the validity of one element of thought. Hence the former may be described as *pure, adequate*, or *positive* laws of formal thinking; while the latter may be described as *mixed, inadequate*, or *negative* laws of material thinking. When logic has been further defined as the science of the laws of formal thinking, it would naturally strike a person who had neither special knowledge of the subject nor an exact appreciation of all the terms employed, that logic ought to be an exceedingly useful thing. The laws on which it is grounded are, as it appears, pure, adequate, and positive; they are sufficient in themselves for an act of thought, they are uniform in their operation, and a perfect guarantee of the validity of the mental process. But, alas! according to Mansel, the instrument becomes useless for the discovery of positive truth the moment an endeavour is made to apply it. It can detect some forms of inaccuracy, but cannot exclude error; it is no guarantee for the result of any process in which thought operates in conjunction with perception and memory. This decision may remind us of the famous case between the nose and the eyes about the spectacles. It seems to the popular mind much the same thing to say that the eyes must be shut whenever the nose wears the spectacles, as to say that the science of formal thinking ceases to be trustworthy when memory and perception are not dissociated from thought. But Kant has demonstrated that a criterion of material truth is not only impossible, but self-contradictory; and Mansel has asserted that an innovator who attempts to enlarge the field of logic only makes it impossible to assign to it any definite field whatever. A view on which Kant and Mansel agree is of course not to be ridiculed or lightly set aside. Their estimate of logic may be allowed the formal validity which is all they claim for it; and it is only mentioned here in order to show the thoroughly consistent character of Mansel's thought. A formal logic, entirely emptied of contents, and a metaphysic devoted to ascertain the limits of something external to itself, correspond to each other like the concave and convex sides of a curve. But the material element, which he excluded from prominence on scientific grounds, might have entered as it were by a back door. Logicians have not only to maintain theories and formulate opinions; they have also to give illustrations. Metaphysicians may communicate a lively impression of their general sentiments and tone of mind when they are attacking or defending an hypothesis of essentially speculative interest. We may know what manner of man Berkeley was from reading his works without consulting a biography. Archbishop Whately and Mr. J. S. Mill have contrived to materialise their works on Logic to quite a sufficient extent; so that the reader may imbibe from them, if he please, not formal thought merely, but views on social science, theology, physics, and political economy. Some very clever proselytising may be accomplished, or at least attempted, by a logician who illustrates the truth from his own opinions, and seeks his examples of the different kinds of fallacy from schools of thought with which he does not sympathize. Illustrations which indicate the private tastes and habits of the writer may be excluded of set purpose from elaborate works on grave subjects; but the detail which would be out of place in a Bampton Lecture may come in both appositely and gracefully in a flying pamphlet or a lively contribution to a magazine. If, however, we look over Mansel's minor writings in order to see on which food his mind fed in private, we shall meet with a somewhat remarkable phenomenon. When he was not metaphysical or logical, he was poetical or facetious. He was well read in mental philosophy, whether Greek, German, French, or English; he was also at home in Horace, and Rabelais, and Hudibras, and modern novels; but his references to subjects not theological, which interest grave men in their more serious moments, are few and far between. Political economy, that favourite exercise-ground of logicians, seems quite removed from his consciousness. A stray reference to Dr. Carpenter's *Human Physiology* strikes us like a portent; and, when examined, it is seen not to relate to any subtle question as to the normal bearing of nervous organization on mind, but to some of the most vulgar manifestations of modern spiritualism. Mr. Darwin, in like manner, is introduced on account of a supposed resemblance between his theory of development and some nonsense indited by a medium personating Tom Paine; and elsewhere we are told that all the varieties of sensational literature may be referred to a source in the same original germ by a law of generation at least as worthy of the attention of the scientific student as that by which Mr. Darwin's bear may be supposed to have developed into a whale. In such references as these there is nothing whatever to indicate that Mansel had given serious thought to the theory to which he refers; but poetry was evidently frequently present to his mind, supplying him, as the case might be, with grave reflections or light fancies; and the clever Aristophanic fragment of *Thrasticterion* establishes a presumption that the poetical vein which undoubtedly lay in his nature would have repaid more earnest and continued working.

It is better, perhaps, to leave off here, and not either to introduce matter which has little affinity with the volume edited by Mr. Chandler, or to run the risk of seeming to build a theory on a literary record which is confessedly fragmentary and imperfect. If Mansel had been intellectually audacious, he could have theorized like Hegel; if he had been careless and indifferent, he could have matched the scepticism of Hume; if he had been irreverent, he could have scoffed like Heine; if he had been frivolous, he could perhaps have rivalled the *Ingoldsby Legends*. But he was neither audacious, nor careless, nor irreverent, nor frivolous; he would be far better described by the reverse of all these epithets. He did some valuable work in a truly remarkable manner, and we may wonder at him the more, without admiring him the less, if we have reason to think that his mind, which could grasp metaphysical abstractions so firmly as almost to compress them into solidity, and could find relief both in diving and soaring on the wings of imagination, was comparatively indifferent to whole families of subjects which seem to the majority of earnest men at the present day to have a reality which is wanting in metaphysics, and a more abiding interest than can be found in fiction.

THE PAINS OF MEMORY.*

A MODERN poet has won much popularity by singing the praise of the "Pleasures of Memory," but surely a companion volume of groans about its pains ought to find still greater acceptance with the general run of mankind, whose memories, if they have any, seem to be nothing but a source of torment to them. We can imagine no one better fitted to carry out the idea of thus immortalizing the mental agonies of his fellow-sufferers than the student, if any such can be found, who has learnt by rote the 591 lines which compose the *English History in Rhyme* published by Mr. Goodwin as a help to students of English History. Within that short compass Mr. Goodwin has strung together in doggerel verses, in almost every known, and some hitherto unknown, measures, a number of hard names of people and places connected more or less closely with the history of our island, from the first landing of Cæsar to the last Thanksgiving in St. Paul's, with which important event he closes his work. This hard task he has undertaken from motives of pure benevolence, if we may believe his preface. He there tells us that

> These Rhymes are published in the belief that they will very materially assist THOSE WHO ARE PREPARING FOR UNIVERSITY, MILITARY, NAVAL, CIVIL SERVICE, AND OTHER EXAMINATIONS, in which an acquaintance with the facts of English History is required; their utility having already been proved in the experience of the author with his own pupils.

Mr. Goodwin has cast a pitying eye on those luckless wights who are year by year forced by a hard fate to rush into the very jaws of

---

* *English History in Rhyme.* By Edward B. Goodwin. London: Simpkin, Marshall, & Co.
The Scholars' Home Lesson-Book. Geography. London: T. Murby.
The Humanity Series of School Books. Edited by the Rev. F. O. Morris, B.A. London: T. Murby.

certain monsters called examiners. He has made ready for these poor defenceless lambs a complete coat of mail that shall be proof against the sharpest fangs of the wily old wolves whose set purpose is to worry them. Once let a candidate have learnt through the 591 lines of Mr. Goodwin's History, and, if he can but remember them, he will be armed at all points. There will be no possibility of smiting him between the joints of his harness, so absolutely disjointed will the harness be.

Swiftly and silently Mr. Goodwin gets over his ground. In sixteen lines he gets through all the dealings of the Romans with Britain. Yet, narrow as his limits are, he finds room to tell us that Cáradoc, or Carádoc as he calls him, wondered "Why Claudius should envy my home." This expression of sentiment on the part of the simple savage is clearly only given us because our rhymer found himself at a loss for a suitable rhyme to Rome. It is somewhat inconsistent with this amount of detail about the British patriot to find the English one, Earl Waltheof, cut short with half a line. Yet all we find about him is—

For concurrence with Roger Earl Waltheof died.

What "*concurrence*" may mean we are by no means sure. It must be used here in some very subtle sense; for, while Roger did concur, Ralph it seems did not, as his name is not brought forward in the matter. We would counsel our rhymer, before he perpetrates the Grecian and Roman Histories in rhyme with which we see we are threatened, to study the simplicity of some of his brother bards of former days. Take, for instance, the couplet in which the cobbler bard, the shoemaker who did well in not sticking to his last, is thus drawn with a few graphic touches:—

Hans Sachs was a shoe-
Maker and a poet too.

What can be more simple, true, and impartial? Where could Mr. Goodwin find a better model? It is too much to expect students who are so pressed for time that they must have the Norman Conquest and all the changes it wrought told off to them in eighteen lines to stop and ponder over a word of such doubtful meaning as "concurrence." We suppose the foot-notes in Mr. Goodwin's little book are intended to "concur" with the rhymes, as we are told that these "foot-notes have been added for ready reference, and it is hoped they may be found useful in furnishing concise answers to some questions of likely occurrence." What the questions are likely to be we cannot take upon us to determine, but we rather think the notes will furnish some very unlikely answers, owing to the perfect impartiality with which they mix up truth and fiction.

In Note 16 to the Saxon Period, for example, we are told the story of Ælfryth treacherously murdering her stepson; while Note 17 records the Massacre of St. Brice; but which is true and which is false, or whether both are true or both are false, the student is left to his own inspirations to determine. Sometimes the notes take for granted an amazing amount of information on the part of the students, as in Note 10 to Henry the Third, where we read:—"By the Treaty called the 'Mise of Lewes,' Prince Edward and Henry, son of the King of the Romans, were taken in exchange for the King." This looks very much as if Mr. Goodwin was a little too anxious to air his own information, and to let every one know that he at least knows all about the King of the Romans. But, after all, since it was as the English King's nephew, and not as Henry of Allemayne, that Henry was given as a hostage, it might have been as well to say somewhere that Richard of Cornwall and the King of the Romans were one and the same person.

It seems to be a commonly received superstition that the memory is a sort of ballot-box into which must be crammed all manner of facts. There, by some queer sort of necromancy, they are expected to assort themselves, so that the right fact shall come out just at the right time. This at least is the principle upon which all the so-called Aids to Memory are put together. Memory, however, takes her revenge by mixing up the treasures thus confided to her topsy-turvy and turning them out all wrong. Hence the wonderful jumbles of blunders to be found in the answers to examination papers. Nowadays, when memory, like the rest of our faculties, seems to be getting weaker as the world grows older, a good memory would certainly be the most useful gift that a kind fairy godmother could bestow. The child thus gifted, by remembering exactly everything he had ever read, or heard, or seen, would have a wonderful advantage over his fellows. As it is, even a moderately good memory often passes for talent, and wins for its owner a share of that respect, strongly tinctured with dislike, which society feels for so-called "clever people." But good memories are rare. Very few among us can lay claim to them. Most people complain grievously of the sad tricks memory plays them, and resort to all sorts of desperate devices, such as tying knots in their handkerchiefs whenever they want to remember anything, though they are themselves perfectly aware that in half an hour they will have forgotten utterly what the knots were tied for. There is, in truth, no end to the odd contrivances by which people try to make crutches for their shattered memories, while, if they would only throw away the crutches and have confidence in their own power of remembering, they would find themselves perfectly able to do so. Surely it is much easier to remember the date of any given event by calling to mind the state of affairs or the current of events at the same time in other places than by going through an elaborate and perfectly unintelligible calculation by way of getting at it; yet we have known persons who professed inability to remember the date of the Norman Conquest save by reckoning that it took place exactly thirty-four years before the year 1100. If we must have technical memories, we prefer the old-fashioned sentences which used to find great acceptance in ladies' schools, by means of which, on repeating certain commonplace propositions, such as "The Spartans ate black broth," the initiated could tell you every possible date from the building of Nineveh downwards. Dates so remembered are practically useless. They can have no ideas attached to them, and they therefore lose their only real importance as connecting links in the unbroken chain of history. As for all metrical helps to memory, they are very shaky props indeed. The jingle of rhyme at the end of the line is all that memory holds, and one name is just as good as another to fill up the void in the middle. Can the following incoherent jumble of hard names be a help to any sane person in remembering the always puzzling battles of the Peninsular War?—

Vimiera Arthur Wellesley gained. Dalrymple made "Convention."
Corunna, Talavéra, and Walcheren, claim attention.
Busáco, Fuentes, Albuéra, Ciúdad, Badajóz, too,
Battles at Salamanca and Vittoria speak of loss to
France, whose force at Pampeluna and Toulouse was scattered,
And Buonaparte, at Lelpsic beaten, found his prospects shattered.

In old times it was thought that memory was only skin-deep, and could be best got at by inflicting bodily pain; hence the custom of beating boys to fix in their memories the bounds of the parishes. On this belief the German schoolmaster acted when he pulled his pupils' ears each time they passed through the gate of the city to impress on them how the French had robbed it of one of its fairest ornaments. For our own part, we should much prefer either being beaten or having our ears pulled to learning by rote the 591 lines which Mr. Goodwin has put together for the benefit of his unhappy pupils. But if any one has a fancy for exercising his memory on such tough work, we think he might just as well try it with a few pages of *Bradshaw* or a column or two of a *London Directory*. We are sure that he would find these exercises quite as interesting, and very nearly as instructive, so far as concerns real history.

History naturally suggests geography, as the one cannot be taught to any good purpose without the other; yet it is strange how far people are from understanding this. If there is one branch of useful knowledge about which the general run of mankind are shamefully ignorant, it is geography. In this, to be sure, we are not a whit behind other nations. The average Frenchman believes that somehow or other every part of England is within easy walking range of London. And we have met with Germans who stubbornly maintained that Blucher only just saved the English from being driven into the sea at Waterloo. Still, two blacks will never make a white, and the ignorance of other nations can be no reason why the British public, boasting as it does of being the most commercial nation in the world, should not know something about the countries with which its trade is chiefly carried on, and, above all, about its own colonies. It is high time that young ladies should know better than to ask acquaintances on the eve of a voyage to Australia to be sure to call on their cousins in New Zealand, or to express a hope that travellers just arrived from Buenos Ayres had had a quiet time coming round the Horn. And yet geography is very much taught, and the little manuals that present themselves for teaching it are legion. The *Scholars' Home Lesson-Book*, one of the last recruits on the list, seems to us to be no whit in advance of its fellows, nor can we find in turning over its pages any new ideas in the way of teaching that might be said to justify its publication. It is like the greater part of such little books, a dry collection of the names of places; and where any lights, either philological or political, are thrown out, they are so very dark that we can only wish that they had been left out altogether. When we find all the Romance tongues spoken of as "Greek-Latin," and the Cinque Ports ranged among the things that were, but are no longer, we cannot but mourn over this sowing of tares to be uprooted in after years. There is no lesson which children like better than geography when it is rationally taught, none that can be made more attractive to them; and yet there is none that is more invariably made distasteful and unintelligible. What is the use of starting off by telling a child in his first geography lesson the number of continents in the world, or by calling on him to remember into how many zones the earth's surface is divided? Would it not be better to work upon his experience of the little bit of that surface on which he lives; to show him what a map means, and on what scale places can be represented on it, by letting him draw one for himself, with all the streams, fields, roads, and streamlets in the parish marked upon it. In this way only can children learn that the black lines wriggling across the sheets mean something more than the cracks in a teacup, and that the conventional mountains of the modern map-drawer are not meant for woolly caterpillars after all, but for hills, higher no doubt than, but still the same in character as, those behind which he himself may any evening watch the sun go down. As things are at present, children learn the names and find the places on the map with very little understanding of the meaning of the different signs marked upon it. We once heard a really clever child, fresh from a geography lesson, while trying to trace a likeness between a pool by the wayside and the Mediterranean Sea, add by way of explanation that of course the pool was much the larger of the two. A child's knowledge of the world is confined to its own hamlet, or at most to its own parish. Surely a wise teacher should act upon this, and, taking this certainty for

the starting-point, extend the lessons from the parish to the county, from the county to the kingdom, and so on till the ever-increasing circles have taken in, not only our own world, but also all that science can teach us of the other worlds that form the universe.

We turn with a feeling of relief to the reading-books of Mr. Morris. They make no pretensions to being the medleys of general knowledge to which the common run of primers lay claim. Still we have a crow to pick with him about his title, which is surely a misnomer. When we first turned over his pages, we were grievously disappointed to find that the word "Humanity" has fallen from its ancient dignity, that it no longer means Latin as the only study worthy of the human intellect, and that the *Humanity Series* is neither more nor less than a collection of pleasant little tales intended to interest children in the welfare of their fellow-animals. We wish Mr. Morris all success in this praiseworthy effort, and we hope that his books will find a welcome in all elementary schools. To teach children to love animals will not only do away with a great deal of useless suffering to the animals, but will also open a new source of happiness to the children themselves. The child will surely be a happier child who through long lonely days of out-door work can find "friends in fur and feathers" all around him, and who, like St. Francis, sees a little brother or sister in every living thing that chance may bring across his path. It is a pity that more of the tales are not told in the first person. Children like tales about animals, but then to interest them the stories must be told by the animals themselves; the children like to feel as if they were taken behind the scenes into the real animal world, instead of merely looking on as outsiders. We cannot but wish that Mr. Morris had stuck to his text, and had kept solely to the tales about animals which he promises us in his preface. We would gladly have seen the moral pieces which are mixed with them left out. Surely it must provoke a smile, even from the most solemn teacher, to find Napoleon Bonaparte quoted as an example to prove the profit of daily reading of the Scriptures; unless indeed he confined his reading strictly to those parts of the Old Testament which Ulfilas left untranslated as being more likely to inflame than to soften the warlike spirit of his Goths.

THE FORTESCUE PAPERS.*

EITHER time flits away yet faster than we thought it did, or else this book has not been in our hands so long as might be thought from its date. We hardly see why it should have been called the *Fortescue Papers*, a title which certainly made us expect to find Sir John or Sir Faithful, or some other bearer of the name of Fortescue, as the writer or receiver of the letters. But they are called *Fortescue Papers*, simply because the originals are in the possession of the Hon. G. M. Fortescue, to whom we doubtless owe our thanks for allowing Mr. Gardiner to make use of them, but who has hardly a claim to give his name to the collection. They belong to the time which Mr. Gardiner has made specially his own, the reign of James the First, ranging from 1607 to 1625, with the exception of a single letter of Charles the First to Prince Rupert in 1644. Of five hundred and eight papers Mr. Gardiner has picked out a hundred and sixty-one, and even of these he says that there are some which he should not have printed if the originals had been easily accessible in a public library. Mr. Gardiner need not be afraid on this head. Of things which are, even in a humble kind of way, real materials for history it is better to print too much than too little. Camden Society books are meant for a special world of their own, and not to lie about on the drawing-room tables of the general public. Few people, even of the special world of the Camden Society, are likely to read such a collection as this all through, or to find matter of interest in every letter; but a great many will find something to their own purpose here and here, and perhaps there is no letter which will not prove of some value to somebody. Take for instance the letters of an earlier date, which Mr. Gardiner does not put in the body of the work, but points and comments on in the preface. There is nothing in itself particularly interesting in the two courtships of Sir Thomas Hobby to Margaret, widow first of a Devereux and then of a Sidney—the unsuccessful courtship in the first widowhood and the successful one in the second. But we learn something from it about the manners and feelings of the times, when we see that the success of the suitor is not at all left to depend wholly on the choice of the widow herself, but that various great personages are called in to back up his cause, and that he fails the first time because other great personages are backing up the cause of a rival. Moreover the old prejudice which in earlier times had deprived the widow of her estate if she married *infra annum luctûs* had no being now. Walter Devereux has not been dead a fortnight before Lord Burghley himself is writing letters to divers persons to get hold of the widow, and with her the lands of Hackness in Yorkshire, for his wife's nephew Hobby. Mr. Gardiner suggests that the Lord Treasurer had something more in view than merely to make the fortune of a young man who was bound to him by ties of affinity. Hackness lay in a district which was full of recusants, and it might be for the welfare of Church and State to get the estate of Hackness, and the influence which would go with it, into the hands of a sound Protestant. However this may be, Burghley's schemes, public or private, came to nought. The widow was under the special protection of the Countess of Huntingdon and her lord, and Huntingdon, then Lord President of the North, may, in Yorkshire have been looked on as a greater person than the Lord Treasurer. Lady Huntingdon also had a nephew to provide for, and the widowed Margaret, before her year was up, became the wife of Thomas Sidney, brother of the famous Sir Philip. The next time Hobby, now Sir Thomas, succeeded, but perhaps more because the widow was afraid of otherwise losing her estate by a Chancery suit than for any other cause. Lord Burghley appears again, and Lord Huntingdon also. In the body of the book we in the like sort find the Duke of Buckingham and other men in power meddling in the same way about people's marriages. The Hobby story also tells us something in the history of nomenclature. Our persevering knight bore the name of Thomas Posthumus, a yet earlier case of a double name than Anthony Ashley Cooper. But, as in the Ashley case, there was a special reason for so unusual a caprice, as Thomas Hobby was born after the death of his father.

Turning to the body of the book, the letters seem to be just such a collection as Buckingham's secretary might be expected to make. A large part of them are letters addressed to Buckingham in his various stages as Sir George Villiers, Viscount Villiers, Earl, Marquess and Duke of Buckingham, while a good many are to Packer himself. The correspondence of both master and secretary gets as high as sovereign princes; Elizabeth, Queen of Bohemia, writes to the all-powerful favourite to use his influence with her father on behalf of her husband; and old Frederick himself writes, "De mon chasteau Royal de Prague," to M. Packer, signing himself "Vostre affectionné amy Frideric." Otherwise Packer's letters come very largely from bishops, and chief among them the Lord Keeper, Bishop Williams, who writes to Packer as "Your assured loving friend," while he writes to Packer's master as "Your lordship's most faithful servant and creature." A good number of the letters from ecclesiastical persons naturally consist of requests for preferment. Thus we find Dr. John Bowle writing to Buckingham as one whom "it pleaseth your honour to rank in the number of your orators whom you please to respect," making his petition on this wise:—

> Sence nowe itt hath pleased God to take the Bishop of Norwich to his mercy, these lines do humbly intreat your Honor to lodge mee in that number whome your Honor will advaunce by this alteration. The Deanery of Westminster, wher I went to schoole, or some such place, is the uttmost of my desire, wher I myght serve my God, and dayly praye for his Majesty and your Honor.

The letter is dated May 18, and Mr. Gardiner gives the year as 1620; but the Bishop of Norwich spoken of must be Overall, who died May 12, 1619, so one would think that it rather belonged to that year. Anyhow, we may note the two different kinds of euphemism by which the death of the Bishop is described, first of all as a "taking to God's mercy," and secondly as "this alteration." Bowle did not get the "utmost of his desire" in the form of the Deanery of Westminster, which was given to Williams, and which Williams moreover contrived to keep after his promotion to the bishopric of Lincoln. But he did get "some such place" in the form of the Deanery of Salisbury; and in the next reign, in 1630, he was consecrated to the see of Rochester, which he kept for the remaining seven years of his life. Bowle however seems to have hoped to get moved from Salisbury to Westminster on the promotion of Williams to his bishopric; but he "most unwillingly gave way to Williams retaining thereof." And this brings in a much more famous man than Bowle, namely, Dr. John Donne, who writes to Buckingham in what we are not twisting his own metaphors if we call a creeping and crawling fashion:—

> May it please your Lordship. Ever since I had your Lordship's letter, I have esteemed myselfe in possession of Salisbury; and, more then Salisbury, of a place in your service; for I tooke Salisbury as a seate of ytt. I hear that my Lord Keeper finds reason to continue in Westminster; and I know that neyther your Lordship nor he knowes how narrow and penurious a fortune I wrestle with in thys world. But I ame so far from dependinge upon the assistance of any but your Lordship, as that I do not assist myselfe so far as with a wishe that my Lord Keeper would have left a hole for so poore a worme as I ame to have crept in at. All that I meane in usinge thys boldnes, of puttinge myselfe into your Lordship's presence by thys ragge of paper, ys to tell your Lordship that I ly in a corner, as a clodd of clay, attendinge what kinde of vessell yt shall please you to make of
>
> Your Lordships
>
> Humblest and thankfullest and devotedst servant,
>
> J. DONNE.

Theophilus Field, Bishop of Llandaff, writes also in a very humble strain to his "ever acknowledged and (next to God and the King) most adored, best patron." Setting forth, not without reason, the sad estate of his "poore lamentabley ruined church of Landaffe, whose revennewes (being the very sinuewes of any sea) are shranke from a thousand pounds yeare to seaven skore pounds." Robert Snowdon, Bishop of Carlisle, writes also to Buckingham:—"I first admired you for the excellences of your person, nature and comportment, but now I tenne times more honor you your vertues and religion testified and recommended to the world by the most judicious and most renowned monarch that ever swayed the scepter of Great Brytaine." This piece of flattery, as far as the King is concerned, is at least prudent, seeing that before the British Solomon no monarch, judicious or otherwise, had ever swayed the sceptre of Great Britain by that name.

But there are things of wider interest in this collection, though the cringing of churchmen, even of such a man as Donne, to one so worthless as Buckingham, is a sign of the times which is not to be passed by. Mr. Gardiner in his preface calls attention to the

---

* *The Fortescue Papers; consisting chiefly of Letters relating to State Affairs, collected by John Packer, Secretary to George Villiers, Duke of Buckingham.* Edited by Samuel Rawson Gardiner. Printed for the Camden Society. 1871.

letter which stands thirty-four in his series, one addressed by King James to the Commissioners for the examination of Sir Walter Raleigh, and bearing date October 20, 1618. The letter is in answer to one from the Commissioners to the King which is printed in Bacon's works, and it explains the nature of the proceedings against Raleigh before the Commissioners. One chief point in the letter is that, as Mr. Gardiner says, it "shows that, at least in James's eyes, it was proved that Raleigh had recommended an attack on the Mexico fleet very early in the voyage." Two courses, it seems, had been proposed, one to summon Raleigh before the Privy Council, the other to put him at once to death on his old sentence, putting forth in print "a narrative of his crimes." James's wisdom determined to follow a middle course. Raleigh was to be brought before the Commissioners, to be accused by the Attorney-General, the warrant to be sent for his execution, and a declaration to be put forth in print. In this declaration the King says:—

> Wherein we hold the French Physitian's confession very materiall to be inserted, as also his own and his consortes confession that, before they were at the Islandes, he told them his ayme was at the fleet, with his son's oration when they came to the town, and some touch of his hatefull speeches of our person.

The reasons which he gives for not calling him before the Council are also remarkable:—

> And for the other course of a publik calling him before our Counsell, we think it not fitt, because it would make him too popular, as was found by experience at his arraignement at Winchester, where by his wit he turned the hatred of men into compassion of him. Secondly, it were too great honor to him to have that course taken against one of his sort, which we have observed never to have been used but toward persons of great qualitie, as namely the Countesse of Shrewsbury, and some such.

There are other letters of King James; the book begins with two written by him to Henry the Fourth of France, the first being about John Forbes, who had had a hand in an alleged illegal ecclesiastical synod held at Aberdeen in 1605, and who was now in France under the protection of Henry. One of his crimes, according to James, was "qu'il vous a celé (pour le moins a ce que nous divinons de vos lettres) qu'il estoit ministre, ains se disant gentilhomme." In the second, in 1609, touching the unjust dealings of the Pope, Paul V., and the "libelles diffamatoires" which had "sorty de la boutique Romaine," he holds forth on Henry's position as Most Christian King, defender of the liberties of the Gallican Church, and especially of the Pragmatic Sanction, which he says "fust premiormont institué et estably par un d'iceulx [vos predecesseurs] si Catholique qu'il en cust le tiltre de Lodovicus Pius." We can bear witness that the same confusion between St. Louis and the Emperor Lewis the Pious has been made in later times, but we should hardly have looked for such a blunder from the judicious and renowned monarch so worshipped by Bishop Snowden.

We will end with a domestic touch. In Letter XVIII. the Electress Elizabeth, not yet Queen of Bohemia, writes to her father, we know not why, in French; but she has at one point to fall back on her native tongue. She writes to ask that her mother and brother will be good enough "de lever au bastesme le petit *black babie* que j'ay eu dernierement." Mr. Gardiner quotes Mr. Green for Elizabeth's use of the same phrase *black babie* for her first child also, and he adds "? = 'black doll.'" Mr. Gardiner is certainly right in his suggestion, for the word "baby" meant "doll," at least as late as Addison's time.

OLD KENSINGTON.*

THIS is the longest story Miss Thackeray has as yet published; it is in many respects the most interesting; it is certainly that which gives us the highest impression of the richness and power of her genius. Those who know her other novels will hardly need to be told that the interest of this one does not lie mainly in the plot or the narrative. Of plot, as one used the word in those old days when secrets were hinted at and the reader's expectations were wrought up till a point arrived at which everything was disclosed and explained, and everybody's future lot was definitely settled—of plot in this sense there is comparatively little. Few events of consequence happen; and even those minor incidents without which no tale can move seem to us introduced not so much because they determine the fate of the personages as for the sake of revealing their characters and modes of feeling. Every occurrence in one's life has of course both aspects; the difference between the novel of plot and the novel of character lies in the prominence given to one or the other. Now in Miss Thackeray's hands the events and their results on the outer life of the personages are almost swept out of sight and forgotten in the feeling with which the whole is suffused, and which gives us an interest in them altogether above the novel-reader's commonplace curiosity "to know how it all ended." In the dreamy, half-hopeful, half-regretful effect it produces, her book seems like a piece of plaintive music, which for its chords has the ever-varying lights and shadows of human feeling, and those colours of the sky and clouds which she brings before us as the background to every scene. The story is indeed exquisitely tender and harmonious; but along with its dreaminess there is a curiously keen power of observation, and of throwing out striking reflections upon character and society. All novelists, one might almost say all writers of a really high order, must of course combine imagination and reflection; but many, and those sometimes the greatest, are not successful in blending these two elements, but either disconnect their musings and speculations from the thread of the story, or allow it to appear that they have constructed the story to illustrate some view or moral lesson or psychological theory, and have seen their characters in its light. Miss Thackeray's art is more perfect in nothing than in this, that her reflections and comments seem always to arise naturally from the words and deeds of her personages, rather than to have themselves suggested to her the latter. In fact, there is no better way of testing for one's self the presence or absence of the true dramatic faculty than by inquiring what is the process which is followed in constructing an imaginary character. If one possesses that faculty, one begins by getting an idea—how it is hard to describe—of the person as a whole, conceives of him as living, and feels somehow what he might be expected to say and do under particular circumstances, just as we feel about the people we meet in the world and have a chance of studying. One may then, if one pleases, go on to moralize upon motives, and spin theories about human action generally, without necessarily destroying the illusion. But if the theory comes first, and the thoughts and acts of the character are afterwards invented to suit it, the conception will want life; and the reflections themselves will lose half their point, because we perceive that they are the framework upon which the whole has been constructed. The dicta and musings which we find in *Old Kensington* are so apposite where they are placed, that they suffer seriously by being extracted. Nevertheless we must venture to select a few:—

> A great many people seem to miss their vocations because their bodies do not happen to fit their souls. This is one of the advantages of middle age; people have got used to their bodies and to their faults; they know how to use them, to spare them, and they do not expect too much.

> "How funny to see so many books!" said Zoe, who was a very stupid girl (clever people generally make the same remarks as stupid ones, only they are in different words).

> Let us do justice to the reluctant prayers that people offer up. They are not the less true because they are half-hearted, and because those who pray would sometimes gladly be spared an answer to their petitions.

> "God bless you," he said, deserting his post with a prayer, as people do sometimes.

> She had but little experience, and coldness of heart comes more often from ignorance than from want of kindness or will to sympathize. Sometimes the fire of adversity warms a cold heart, and then the story is not all sorrowful. The saddest story is that of some ice-bound souls whom the very fires of adversity cannot reach.

> Thoughts seem occasionally to have a life of their own—a life independent—sometimes they are even stronger than the thinkers, and draw them relentlessly along. They seize hold of outward circumstances with their strong grip. How strangely a dominant thought sometimes runs through a whole epoch of life!

> It was a dinner party just like any other. They are pretty festivals on the whole, though we affect to decry them . . . . It is fortunate, perhaps, that other people are not silent always because we are sad. With all its objections—I have read this in some other book—there is a bracing atmosphere in society, a Spartan-like determination to leave cares at home, and to try to forget all the ills and woes and rubs to which we are subject, and to think only of the present and the neighbours fate has assigned for the time. Little by little, Dolly felt happier and more reassured. Where everything was so commonplace and unquestioning, it seemed as if tragedy could not exist. Comedy seems much more real at times than tragedy. Three or four tragedies befall us in the course of our existence, and a hundred daily comedies pass before our eyes.

> Helpless as Philippa was, her helplessness always leant in the direction in which she wished to go; and in some mysterious fashion she seemed to get on as well as other stronger people. Some young officer in a complimentary copy of verses had once likened her to a lily. If so, it was a water-lily that she resembled most, with its beautiful pale head drifting on the water, while underneath was a long limp straggling stalk firmly rooted. Only those who had tried to influence her knew of its existence.

The story has, we think, suffered, as several of Miss Thackeray's stories have suffered, by being published in a magazine, and therefore, we may probably assume, written by fits and starts, and under some pressure. It is unequal; there are places where the writing becomes comparatively careless; and we can hardly doubt that by the expenditure of a little more pains the narrative might have been better bound together, and the figures set upon the canvas more clearly, instead of being allowed to drop in or turn up in a way which is apt to be confusing. But when we come to the individual characters, we have nothing but admiration for the skill, the grace, the delicacy, the subtle insight with which they are painted. The heroine, whose right it is to be first mentioned, is a very charming and lifelike conception—lifelike just because one perceives that there were points and sides in which she was not attractive, but perhaps a little repellent. She is not in the least like Maggie Tulliver in the *Mill on the Floss*; but the study of the development of her character from childhood into youth and womanhood, the preservation of its distinctive features under the changes which love and sorrow and the knowledge of good and evil bring with them, is one which deserves to be placed beside the similar study of Maggie's growth in that wonderful work of a wonderful genius. Next to its intense truthfulness, the keynote of Dolly's character is its imaginativeness, shown in a keen susceptibility to the influences of external nature. Few English writers, and perhaps no English novelists, have shown a more admirable power of describing what we may call the sentiment of nature—that fancied sympathy for human passion of sunshine and shadows, clouds, trees, and streams, which is the way in which poetical temperaments express the impression that all these things make on them in moments of high-strung feeling. It is indeed only such temperaments that experience such impressions, as it is only sensitive people that are strongly affected by the

* *Old Kensington.* By Miss Thackeray. London: Smith, Elder, & Co. 1873.

presence or the moods of other human beings whom they feel to be in some way either congenial or chilling; and one knows abundance of men, and women too, who, like Robert Henley in this story, set down a susceptibility to either class of influences as mere weakness or childishness or affectation. The latter form of susceptibility is no doubt far commoner than the former; but the former is so real and interesting where one meets it, that it deserves all the care and refined art which Miss Thackeray has (some may think too frequently) bestowed upon it here, and which has given occasion to some of her most charming sketches of scenery. The college garden at Cambridge, the evening scene on the Thames at Kingston, the description of St. Paul's Churchyard on the day when Henley and Dolly go to service in the Cathedral, are not only wonderfully vivid as pictures, but are skilfully used to bring out the contrast between the girl whose emotions were stirred in a way she did not understand by the beauty around her, and the obtuse energetic man to whom she had engaged herself in a sort of dream, and whom she then clothed with all the bright colours of her own fancy. Henley is perhaps the most finished and successful study of a prig in modern fiction; and he shows very forcibly what a terrible thing priggishness may be when it lies deep down in the soul, and is not, as sometimes happens, a mere affair of manner, the result of education or circumstances. The essence of his priggishness consists in a want of subtlety and insight, a fault which may be called as much intellectual as moral (to use the common division), but which poisons his whole nature. In many points of view he is a worthy person; he has good principles, a sense of duty, a firm will, a superiority to the more vulgar pleasures, a disposition to admire and be attracted by what is really beautiful, even a sort of unselfish capacity for affection. But he has no power of understanding a sensitive and impressionable nature like Dolly's; and just as little of knowing and judging himself. We do not mean to say that a man may not be both conceited and self-conscious, for conceit can take an infinity of shapes; but in Henley it is in great measure the want of self-consciousness that leaves him at the mercy of his conceit, and makes him the dupe and slave of a number of wooden formulas which he calls his principles. Most people are liable to mean thoughts and impulses; but self-conscious people, unfortunate as their condition is in other respects, have at least the advantage of knowing when these impulses are mean, and preventing them from taking effect in acts. This is what Henley wants; the absence of fine discernment makes him mistake bare selfishness for adherence to principle, and renders the sense of duty which he all the while possesses and fancies himself to be obeying, almost worse than useless.

The secondary characters are not less admirable, and even those who merely pass across the stage, like Squire Auley and Colonel Witherington, or whose voices are heard from behind the scenes, like Admiral Palmer, have a sharp individuality that witnesses to the wealth of dramatic faculty in the mind that produced them. Lady Sarah Francis is quite new to us; nor can anything be more delicate than the way in which her somewhat grim exterior, her suspiciousness, her habits of parsimony, are so touched as to increase, instead of weakening, the sympathy we feel for her. Philippa, the heroine's mother, might have been drawn by Mr. Thackeray himself; and it may be said (as somebody said of Mr. Wilberforce's one sarcastic speech) that it is the strongest proof of the authoress's kindliness of nature that, possessing such a power of satire as she displays in this instance, she should so seldom exert it. The Morgan household are all very real, down to stupid, good-natured Zoe, with a happily suggested family likeness behind their contrasts; and the influence which bringing up in such a household would have upon the development of a character like Rhoda's is one of the most thoughtfully handled things in the book, though, as it is merely hinted at, the point might easily be missed. Rhoda herself we are not sure that we understand; but, seeing that there are some female characters which men never do understand, we dare say this is as it should be.

When we began writing, we meant to reproach Miss Thackeray with publishing her stories by instalments—a plan which, whatever it may be to the reader, is usually a disadvantage to the writer. But reading *Old Kensington* through a second time has given us so much pleasure that we don't wish to delay the beginning of another similar enjoyment a moment longer than is necessary. No work more clear and true and pure, more full of tenderness and grace, and of that insight which nothing but a keen sympathy with every phase of joy and sorrow can give, is produced among us than that by which she sustains the honours of her father's name.

SLAVE-CATCHING IN THE INDIAN OCEAN.*

CAPTAIN COLOMB has written a book which contains much useful evidence as to the Eastern slave-trade, and which at the same time is really entertaining. Captain Colomb writes well, though he is perhaps a little too anxious to be facetious in the opening pages; he is a shrewd observer of men and things; and the views which he expresses, though not calculated for the palate of the general public, deserve a more serious answer than they are likely to receive. We will first describe his opportunities for observation, and then briefly consider his conclusions.

Captain Colomb was appointed to the command of the *Dryad* in 1868, with orders to take part in the suppression of the Eastern slave-trade. He was, as he tells us, in a state of mind not very unusual with naval officers. He knew next to nothing as to the nature of the trade upon which he was to operate; and had to trust to picking up information on the scene of action. On the other hand, he had a code of elaborate regulations as to the mode of dealing with slave-dealers when caught, which, as we are rather led to infer, had been drawn up by officials not much better acquainted with the peculiarities of the trade than Captain Colomb himself. Besides this, he had for his further guidance, or his further perplexity, the text of a number of treaties between England and the various Powers which are more or less interested in the slave-trade. Captain Colomb was thus in the position familiar to British officers; he was to be at once energetic and strictly legal; if he was afraid of responsibility, he could not do his duty effectually; and if he did his duty effectually, he would very probably get into a scrape. He seems to have accepted his position in the best spirit, and, notwithstanding treaties and rules of international law, to have succeeded in inflicting a good deal of injury upon the slave-traders. The general nature of his operations on the principal scene of action is easily described. Lying in wait with his ship behind a headland of the Arabian coast, upon the summit of which a signal station had been erected, he was near the main stream of the slave-trading commerce. Whenever a "dhow" appeared, boats were in readiness to rush out upon the unsuspecting native, and, in case of need, the *Dryad* could get up steam and join in the chase. The dhow being captured, Captain Colomb proceeded to hold a court. Was the dhow engaged in the slave-trade or not? The instructions said that that question was to be answered by the presence or absence of certain symptoms, which had apparently been catalogued from the experience of the American slave-trade. As a matter of fact, the fatal signs—such, for example, as a number of shackles and handcuffs—were generally absent from the Arab slaver, whilst others were equally characteristic of the vessel engaged in legal trade. If, again, the dhow was condemned, the proper course was to forward her to a port of adjudicature. The nearest port of adjudicature was several hundred miles off, and the dhows are a kind of ship in which no English officer would trust a prize-crew. Thus, to obey the regulations literally would involve a very long absence from the station for the sake of condemning a single prize. Practically the course adopted was much simpler. One dhow, for example, contained a fat little nigger boy. If that boy were merely a domestic slave of the captain, his presence was unobjectionable. If he were an article of export, the dhow was a slaver. By the help of an Arab interpreter, a long cross-examination of the captain, the crew, and the nigger, led, after two days' discussion, to the conclusion that the boy had in fact been kidnapped at Zanzibar. The dhow was therefore sent to the bottom, and the crew allowed to find their own way home. As, in fact, all Arab traders have slaves with them, and the slaves are generally contented, or, at least, stolidly indifferent, it requires no little legal acuteness to discover whether the slaves are articles of merchandise or part of the legitimate crew. However, some rough and ready means of approximation to the truth was generally discovered; though it may be doubted whether the justice of the proceedings commended itself to the Arab mind. At length, however, Captain Colomb had the luck to come upon two or three genuine slavers, full of black articles of commerce to the brim. When the English flag appeared, they generally made straight for the shore; the dhow was destroyed in the surf, and as much as possible of the cargo was saved and marched off into the interior. Once away from the shore, English officers have of course no right to interfere with them. Captain Colomb's operations resulted in the release of 175 slaves in the course of a month's cruising. His description of their manners and customs when on board is graphic, if not complimentary. According to him, they were little better than dumb animals; accepting their change of fate with stolid indifference, and not showing the smallest sign of surprise at the novel sight of a man-of-war, or of the ponderous engines working close beside them. It does not appear that the slaves captured by Captain Colomb were suffering from ill-treatment. In the case of the largest capture which he made he describes the rescued cargo as consisting of "plump, well fed, healthy-looking negroes." Occasionally indeed there is great suffering; and crews of famished skeletons may be found crammed into an insufficient space. Captain Colomb, however, seems to be of opinion that, as a rule, the slaves and their masters fare pretty much alike, and that the sufferings are due rather to the want of foresight characteristic of the Arabs in general than to any cruelty in the traders.

And this brings us to Captain Colomb's conclusions upon the slave-trade in general. He does not, as will have been already inferred, take by any means an Exeter Hall view of the question. He entirely disbelieves in the pathetic black, forced from home and all its joys, and claiming to be a man and a brother. The black is, in his opinion, an apathetic and utterly stupid creature, who makes, on the whole, a decided advance in civilization by transportation to Arabia or Persia. Our notions of slavery are chiefly derived from the case of slaves said to have been worked to death on a West Indian plantation, in days when it was cheaper to import new hands than to grow them in the country. In the East domestic slavery is by no means degrading for the negro. Captain Colomb indeed admits that the Zanzibar slave-market is a disgusting sight; for it is disgusting to see men reduced to the level of cattle; but he witnessed none of the barbarities or indecencies said to be practised there. The word slavery, in fact, includes many different conditions. In Zanzibar there is no distinction in words between slavery and free service, and no difference in the modes of working and living between the

---

two classes. The slave may compel a cruel master to sell him. He need only give five days' labour in a week. He can own property, and very frequently invests his little savings in purchasing other slaves. He cannot be sold, except in extreme cases of ill-conduct, or separated from his family. And all these regulations exist, not merely in theory, but in practice. Thus, according to Captain Colomb, slavery in this mitigated form is on the whole beneficial in the stage of social development actually in existence; and our abolitionists allow themselves to be excited by the name, without taking the trouble to examine into the circumstances which it implies. In short, Eastern slavery is not slavery in the Western sense. But, then, it will be asked, what do you say to the slave-trade? The unanimous opinion of all travellers is that the slave-trade is one of the main causes of demoralization amongst the negroes of the interior. Captain Colomb's reply deserves notice; but it must be added that this is the part of the case on which he speaks with the least authority. His own experience was necessarily limited to the coast, and he only argues about the interior slave-trade from sources open to everybody. He argues, however, with some vigour that the slave-trade has been made responsible for many evils which it does not really produce. The statements generally made as to the loss of life incurred in bringing caravans from the interior rest on most unsatisfactory evidence. The depopulation of the country attributed by Livingstone and others to the slave-trade is really due, as he seeks to prove from their own pages, to famines in bad seasons. The slave-trader is generally said to be hostile to more legitimate commerce. The real fact is that he combines both branches of trade. The same man deals in ivory or in slaves according to circumstances; and ivory is the most profitable of the two. The trader, therefore, would not encourage a war which would be fatal to the most productive part of his trading in order to stimulate the production of slaves. War, indeed, is produced as much by the legitimate variety of commerce as by its rival; for a native tribe will attack another to plunder it of its ivory as well as to steal its men.

The argument strikes us as very questionable when compared with the more direct accounts of the proceedings of slave-traders in the interior; and it would apparently lead to some rather startling conclusions. If slavery is really a mode of improving the African, if the slave-trade is desirable as a means of carrying commerce into the interior, then it would appear that we should rather encourage than exterminate the practice. Captain Colomb appears to think, indeed, that if we could hermetically seal the whole coast to the slave-traders, we should have conferred no benefit upon the tribes of the interior. They would continue to fight and to make slaves just as freely as before, and the only difference would be that the negroes would be spared a journey across the sea. He would be, if anything, more barbarously treated in making articles for export than if he were exported himself; and the net result of our operations would be as futile as most spasmodic benevolence. It would, however, be entirely unfair to represent this as Captain Colomb's last word on the subject. Undoubtedly he diverges from the ordinary view of the British abolitionist, but it is to take what, in his opinion, is a wider and not a less humane view of the subject. Slavery and the slave-trade, he says, are not the cause of all the evils of African society, but rather a symptom. Civilization there is at a low ebb, and slavery is a natural incident to civilization in that stage. Our treatment is defective because, whilst applying a vigorous corrective to the symptoms, we do not endeavour to eradicate the disease. Our burnings of dhows and emancipating of slaves—who are generally all the worse for our interference—rather hamper the trade, but they do not help to introduce a better state of things; both our victims the Arabs, and their victims the negroes, are utterly unable to appreciate our motives, and the only result is a slight alteration in the path of commerce. What, then, is to be done? If the British public would permit it, the right thing would be to form some English settlements on the East Coast, to treat the negroes there with the good vigorous discipline which has made the Kroomen really effective sailors on board of our men-of-war, and to raise up a generation capable of acting as missionaries of religion and of commerce amongst their own countrymen. The process would take some generations to carry out effectually; but in that way a real beginning might be made towards a genuine process of civilization. What is the chance that the British public will adopt Captain Colomb's view?

THE MILITARY STRENGTH OF RUSSIA.*

TIMES are indeed strangely altered since it was the fashion to repeat Napoleon's saying that Europe must become "Republican or Cossack," with a strong emphasis on the latter as the more probable alternative. The Crimean War, though its results are naturally depreciated by the party which would prefer peace at any price to the results of any war whatever, at least did the European world a marvellous service in helping nations to understand what was the true nature of the gigantic machine of despotism of which so many nations had stood in unreasonable awe. For then was it first made generally known that there is a vast difference between commanding the implicit obedience of seventy millions of subjects distributed over a huge territory, and bringing their scattered forces into action at a definite point. It is true indeed that the Russian arms had come with a certain lustre out of the old war against Napoleon. Cathcart, the only English military writer on the great campaigns of 1813 who knew his subject scientifically, declared plainly that the soldiers of none of the many nations engaged bore the fatigues of marching with the same endurance and discipline as the Russians, and that their cavalry especially was a marvellous display of military power. On the other hand it should be remembered, when studying this subject critically, that the Russians of 1813 and 1814 enjoyed the special prestige justly due to their country for its successful defence against the conqueror of the rest of the Continent, and that diplomacy was deeply interested in magnifying both the strength and the exertions of the contingent which served under Alexander against Napoleon up to his first overthrow and abdication. The gratitude of nations too, though not very enduring, is by no means always an illusory notion; and we, whose military prowess stood justly high in the world's opinion at the time of that great event, need not be surprised at the admiration bestowed on the constant advance of the Russian standards from the ruins of Moscow to the walls of Paris.

Gratitude, however, may fade, while fear remains. More than forty years had passed by without the appearance of Russian soldiers in contest with any foe more civilized than the Turk. The world knew of their performances only from the constant records of successful struggles against the Mahometan nations that bordered their vast Empire on every side but the West; and so far as the history of these wars was heard, it was well calculated to maintain the reputation won by Russia in the second decade of the century, and to inspire the belief that her power was hardly less great for attack than for defence. Then came the sudden intervention of Prince Paskievitch with the garrison of Poland on the flank of the Hungarian contest. Görgey, and his comrades of the revolutionary armies, already outmatched in their contest with Austrian power, were willing to inflict a last humiliation on the sovereignty against which they had rebelled by at once laying down their arms to this new opponent, who had crossed the Hungarian frontier with his well-drilled and apparently resistless battalions. Bloodless and easy as the Russian triumph was, it had a singular effect in confirming the traditional belief in the military strength of the great Empire, which was thus able, as it were, to terminate her neighbour's difficulties by a mere demonstration. And thus it came about naturally that when England unexpectedly found herself forced, five years later, into a contest with the power so long spoken of as colossal, she entered on it, despite the vapouring of Mr. Cobden about the superior strength our commerce must give us, with a certain feeling of awe, as though engaged with an adversary furnished with military resources which no one could exactly pretend to measure.

The events of 1854-55 undeceived the world very thoroughly. The failures of Russia before the Danube fortresses—defended rather by the moral power of fanaticism well directed than by genuine material means—first shook her reputation. Then came the defeat of the Alma, a defeat suffered on her own chosen battle-field, boastfully occupied in full assurance of certain victory over the inexperienced invaders. When to this succeeded the long defence of Sebastopol, with its varying incidents of endurance on either side, the great fact shone out, that with all the courage to attempt, the Russian generals failed in the skill or power to make, a successful diversion. The check of Balaclava was followed by the bloody defeat of Inkermann, and the disastrous repulse at the Tchernaya; and the great leaguer slowly but steadily went on to its appointed end. Despite the genius and courage of the technical part of the defence, the huge fortress fell; and the very length of the resistance, with its despairing close by voluntary abandonment, proved conclusively to the world—to Russia no less than to other nations—that with the army open to succour, an entrenched line skilfully prepared and provided with the vastest material that fortress ever held, the defence had failed simply because the boasted strength of the Empire was so little capable of concentration, or of application to a particular point of its own frontier, that it was unable to maintain an equal front with forces brought from the most distant parts of Europe, better supported as they were from their far-off bases at Woolwich and Marseilles. The prestige of the Muscovite was effectually crushed. How much deeper would it have sunk had the world known what has but very recently been made public in the *Military Magazine* of St. Petersburg, that the wisest and oldest of the servants of the new Czar, the very same Paskievitch whose appearance in the Hungarian field six years before had so startled Europe, spent almost his last breath in adjuring his country to make peace whilst she had still one friend left in Prussia; for "I dread," he said in the plainest terms, "a new invasion of Russia by Europe conducted more prudently than that of Napoleon."

But if Russia was humbled by the events of 1855, the lesson of adversity was not lost on her rulers. From that time she has set herself steadily in the path of moral and material progress by which alone the whole means of great empires can be made subservient to the needs of war. Her people have been set free from serfdom. Her provinces are now bound together by the network of railways the want of which made her unable effectively to succour Prince Gortchakoff when overborne by the Allies. Her power has risen again steadily year by year, until we behold her once more reaching threateningly forward into Central Europe, at the very same time that she prepares to push

Die Heeresmacht Russlands. Berlin: Duncker.

her conquests into the heart of Asia. It is the strongest testimony to the revival of her power that the new Empire of Germany is making use of the millions wrested from France to throw a girdle of first-class fortresses along her eastern frontier; whilst the whole internal policy of Austria towards the motley population of trans-Leithania is guided by the desire of watching against the expected aggression from the side of Muscovy. Emperors may meet in brotherhood, and guards of honour may receive fraternal greetings; but the truth remains, as all know who see beneath the surface, that the soldier-caste of Germany are looking forward with scarcely disguised eagerness, and the politicians of Austria with ill-concealed dread, to the hour which shall see the national forces of one or both face to face with the legions of Russia. Not that the conditions of the struggle of 1807 and 1812 between West and East can be again repeated. For, whilst Russia has advanced, her neighbours have not stood still. And it ought never to be forgotten in any attempt to forecast the wars of the future, that those very appliances of civilization on which the advocates of peace once founded their faith, the boasted improvements in the art of communication which were to have bound mankind together in a brotherhood of nations, have proved not a whit less available for war than for commerce. Nay, comparing the results of recent history, it is by no means safe to assert that facilities for the aggrandizement of commerce have increased more rapidly since railroads and telegraphs covered the face of Europe than facilities for making war on a terrible and effective scale. One single main railroad through Poland and Lithuania would have strengthened Napoleon in 1812 more than a second half-million of soldiers. Doubtless some feeling that this was so weighed on the mind of Prince Paskievitch when, towards the close of the contest round Sebastopol, he gave the advice already mentioned. And it is very certain that no strategist worthy of the name would regard an attack on Russia as barred by the same difficulties which ruined alike Charles XII. and the mightier warrior who followed his footsteps towards Moscow with a greater force than monarch ever put into the field until armed Germany moved as one man to avenge his oppression on the inheritor of his name and Empire.

The problem of Russian strength has occupied many minds among the military students who abound in the councils of the great Continental military Powers. The Austrian War Office has devoted a special volume to it, recently translated by our own Topographical Department. And Prussia has a work of her own, published indeed anonymously, but attributed by general consent to the same able essayist who wrote for Count Moltke his History of the War of 1866. The former is a remarkably complete, though dry, account of the existing military organization of Russia, but it fails altogether to give any insight into the moral power which is to wield this, or to point out in any lively manner the peculiarities of breeding or discipline which have made the Russian serf in his half-emancipated state of soldier at times so formidable and enduring a combatant, at others so helpless a machine. Neither, indeed, does the Prussian writer of *Die Heeresmacht Russlands* enter philosophically into this matter. But he does put plainly before his readers the essential effects of the post-Crimean reforms on Russian organization, and the differences between the present military system and that of his own monarchy, as well as its improvements on that which existed under the Emperor Nicholas. The changes made since that great drill-master of the Muscovite serfs and terror of European diplomatists passed away, the victim of his own broken-down projects of aggrandizement, may be summarized shortly as follows.

Until a few years since the Russian forces consisted of two great sections, the Active army and the Reserve. The latter comprised the same description of passed soldiers as form the German Landwehr, and were not called out except for war. If war occurred, the reserve battalion of each regiment, which was maintained for the purpose, was designed suddenly to be enlarged to three, corresponding nearly to the three active battalions kept up normally in the regiment. These additional battalions were to be filled up with reserve men, and officered by transfers from the others, with a large supplement of new commissions. It is speaking mildly of such a system to say, with the Prussian writer, that mobilization under these conditions would amount to "a general upsetting of all proper conditions of command." The theory was no doubt effectually settled by the events of 1855. Since that time the so-called Reserve Army has disappeared from the Russian organization; the number of active divisions has been largely increased; and although (as we may add on our own authority) a number of trained soldiers are constantly kept for economy's sake on furlough, the cadres of the real forces are immensely augmented. The paper total is indeed less than that of ante-Crimean days, when the so-called Reserve of 290,000 men, if ever embodied, being added to the Active force of 360,000, would have given an effective of 650,000, as against the 584,000 now on the rolls. But the latter the Prussian writer believes to be vastly more efficient for any warlike purpose, and we have no doubt that this view is correct. Both these statements exclude immense rolls of non-combatants, as well as the numerous local corps maintained exclusively for garrison or training objects, and not available for the field. These, if added, would swell the Russian army to nearly the million at which it has been popularly estimated.

Of the organization by which the military mass is controlled, and the peculiar characteristics of this, as compared with that of Germany, no space remains to us to speak to-day. For the same reason we must reserve all mention of the reforms recently proposed by the Commission, and understood to be adopted in the Imperial Council, though so strongly opposed by the Minister, General Miliutin, as to threaten, according to latest reports, his actual resignation of his charge.

LA FEMME DE CLAUDE.[*]

IN London, less theatrical than Paris, when a play has failed, it soon glides out of the memory, and no more is heard about it. Such is not the case in the French capital. There, if the dramatist whose work has proved unfortunate has attained a certain degree of eminence, and more especially if he is held to represent some shade of public opinion, he has a chance of getting more fame by failure than by success, and may fairly say, like Mawworm, without a tinge of hypocrisy, that he likes to be persecuted. His play, withdrawn from the boards, is nevertheless published, and its publication provides him with an opportunity for adorning it with an elaborate preface, in which he can attack his foes and propound his theories, with a full assurance that the book will be extensively read. In some cases, of the two parts of which the book is composed, the preface and the play, the former is the more attractive; and we are inclined to suspect that among the students of French manners who have invested four francs in the purchase of the very goodly volume which contains the last dramatic emanation from the brain of M. Alexandre Dumas fils, the majority of those who go steadily through *La Femme de Claude* are stimulated so to do less by the pleasure derived from the play itself than by a desire to obtain the proper standpoint for the enjoyment of the preface.

La Femme de Claude, announced long before, was ultimately brought out at the Gymnase in the middle of January last. The event was anticipated with an eagerness to which, where the drama is concerned, nothing in England can be compared; the excitement that is invariably caused in Paris by a *première représentation* having been heightened in this particular case by the knowledge that the play would illustrate the doctrine already preached by its author in the pamphlet *L'Homme-Femme*, which had been published in the previous summer, and had made a noise such as no writer of essays on social science can hope to produce who does not wield his pen with the verve and utter freedom from restraint which pertain to the younger Dumas. Even those courageous ladies for whom it is a pleasant recreation to study the details of Contagious Disease might light upon pages in *L'Homme-Femme* which they would consider rather strong.

The purport of the book, as many of our readers will remember, is however sternly moral, to a degree that would have won the applause of an old Puritan governor of New England. With such horror does M. Dumas regard female frailty that, in his opinion, a worthy man wedded to a woman who has deceived him, and who cannot possibly be recalled to the path of virtue, has only one course to pursue. This course is indicated in the counsel he would give to his son, if he were fortunate enough to have one. Speaking of the incorrigible lady, he says:—

> Ce n'est pas la femme, ce n'est pas même une femme; elle n'est pas dans la conception divine, elle est purement animale; c'est la guenon du pays de Nod, c'est la femelle de Caïn; tue-la.

Since last June the concluding words of the above passage have almost become a party cry, and if we regarded the remarks made in some of the Parisian journals as a fair index of French opinion, we should be forced to believe that the question, how a faithless wife ought to be treated, lately divided society into two hostile camps—one headed by M. Dumas, with the terrible "Tue-la" on his banner, the other by M. Émile de Girardin and M. H. d'Ideville, who preached the duty of pardon. It is no mere supposition that the coming *Femme de Claude* was intended to illustrate the doctrine of *L'Homme-Femme*, the author having made in the second page of his pamphlet a declaration to that effect. The French public fully knew what they had a right to anticipate:—

> Il va sans dire [says M. Dumas in the pamphlet] qu'il s'agit d'un Claude moderne, conscient, chrétien, et non du Claude historique et imbécile qui fait ou plutôt qui laisse tuer sa femme par Narcisse. Quant à la femme, c'est l'éternelle Messaline, après comme avant le Christ.

By some of the French journals great pains were taken to describe the aspect of the *salle* of the Gymnase on the 16th of last January. The two opposite opinions on the grand theme were fully represented, and the angels of justice and of mercy were both present in the shape of M. Alexandre Dumas and M. Émile de Girardin.

With all possible brevity we perform the necessary task of giving some notion of the plot of *La Femme de Claude*. The action of the piece is supposed to take place in one of the French provinces since the termination of the late war. Claude Ruper, disappointed in his hopes of domestic happiness, in consequence of the utter wickedness of his wife Césarine, who indulges in the two opposite bad habits of eloping with some newly found lover and coming back when least wanted, has devoted all his energies to the invention of an extraordinary cannon, which will enable its owner to destroy any foes, however great their numerical superiority, and may consequently lead to the resuscitation of his country. His companions are Antonin, a young friend, who is a partner in his studies, and shows his proficiency by the minor invention of a double-barrelled musket, which can however do extraordinary things; an old Jew, named Daniel, whose

[*] *La Femme de Claude, pièce en trois actes, précédée d'une préface.* Par Alexandre Dumas fils. Paris: Lévy Frères. 1873.

sole object it is to discover the eleven lost tribes of *Ephraïm (sic)*; and Daniel's daughter Rachel, a somewhat dreamy young lady, who worships him with that sort of love which people are accustomed to call platonic. At the commencement of the play Césarine unexpectedly makes her appearance at Claude's abode, having lived several weeks with a lover, under the pretext of a visit to her grandmother, with the full determination of obtaining a pardon from her husband, who, taught by a long and bitter experience that her life is one uninterrupted course of evil, has ceased to regard her even with indignation; and who, discovering that his friend and pupil Antonin is smitten by her indubitable charms, contents himself with warning the youth in the kindest manner not to waste his affections on a creature so miserably worthless. Another visitor is M. Cantagnac, ostensibly a retired notary, who talks with the accent proper to Marseilles, and has been attracted to the house by an advertisement, in which Claude, hard pressed for money in consequence of his devotion to work hitherto unprofitable, has offered his landed estate for sale. He has heard of the cannon, and would rather advance a large sum, on the understanding that he is to receive one-fourth of the profits that may result from the invention, than purchase Claude's estate. The offer is refused, as Claude will have no partner in his glory, and, the offer of sale being renewed, M. Cantagnac is left to talk business with Madame Rupel, whose consent to the operation is legally necessary. No sooner is the supposed notary left alone with Césarine than he drops his southern accent, and, without any attempt at circumlocution, bluntly asks her what price she will take to betray the secret of her husband's invention. He is the agent of an anonymous society, with an unlimited capital, which by purchasing the ideas of others resolves to become master of the world, and Claude's cannon is just one of the articles which the society would like to possess. As Césarine does not jump at the offer of money, Cantagnac explains that refusal on her part will be dangerous; and he calmly recounts to her all the infamy of her past life, including the birth of a child before her marriage with Claude. The implied threat of exposure she meets with a smile, informing her kind biographer that her husband already knows and has condoned all the facts he has enumerated; but presently he comes to a fact which Claude does not know—namely, to a dark deed perpetrated on a certain 1st of September, which seems to have been the destruction before birth of a lawful child, and, as Macheath would say, her courage is out. She is in the power of Cantagnac, and she will do all she can to betray her husband, it being understood, however, that in the event of her success she will receive some little remuneration, not as yet defined.

The second act makes us acquainted with those mysterious persons the Jew Daniel and his daughter, who, as the former assures us, are about to set out on a voyage which may possibly comprise China, the Salt Lake, and the Desert of Sahara; the zeal of the old gentleman in looking out for the lost tribes not being accompanied by the slightest notion of their whereabouts. Rebecca's motive for accompanying her father is clearly her anxiety to leave the house of the man she dreamily loves now that his wife has returned. The Parisian public do not seem to have exactly understood the utility of this Hebrew maiden, but to have regarded her somewhat as a bore. They will know better now that the preface is published. She serves to impress upon the mind one great defect in the matrimonial law of France. If good Claude could have obtained a divorce, he might have taken amiable Rebecca for a wife in the place of abominable Césarine; but now the union must be deferred until the two pure souls shall meet after death in the region of bliss. In the meanwhile Césarine, feeling no kind of repentance, vainly seeks to obtain a reconciliation with her imperturbable husband, who is not moved till she darkly hints that his obstinacy may cause the sacrifice of those whom he loves. He now tells her that, where she only is concerned, she may do whatever she likes, but that if she interferes with his invention, which is to benefit humanity in general and France in particular, or with any of his private friends, he will certainly kill her. It is especially Antonin that he has in view; for he knows, as we have said, that this young man is smitten. The value of the youth, in the eyes of Césarine, is simply this—that he keeps the key of the coffer in which Claude's plans are contained.

The whole action of the piece is comprised within the limit of a single day. Claude has promised to accompany his Hebrew friends to the nearest station, and during his absence his coffer is to be ransacked by Césarine in the interest of Cantagnac. Césarine has secretly entrusted Antonin with a round sum of money, the gift of another admirer, and it is deposited by him in the coffer for safe custody. When he is left alone with the designing lady, he reluctantly consents to elope with her, and, as ready cash is required for that, opens the lid of the box. She takes immediate advantage of her opportunity to seize on Claude's papers, and would throw them from the window to Cantagnac, who is waiting outside. In this deed of villany, however, Antonin will not be a partner, but, struggling desperately with Césarine, he endeavours to obtain the restitution of the papers, when the contest and the piece are suddenly brought to an end by Claude, who, warned by a female servant, unexpectedly appears, and, crying "Voleuse!" shoots his wife dead with Antonin's musket. Antonin is fully prepared to receive the contents of the other barrel; but Claude simply throws down the weapon, and kindly says, "Et toi, viens travailler"; whereupon the youth kneels to his benefactor as the curtain falls.

The play did not greatly please, and its run at the Gymnase was not of long duration, bringing more repute to Madlle. Desclée, who represented Césarine, than to M. Alexandre Dumas. But, if its own life was not merry as well as short, it was a fruitful cause of merriment in others; and seldom has a more diverting *jeu d'esprit* appeared in *Le Figaro* than the report of Claude's trial for the death of his wife, at which all the *dramatis personæ* appeared as witnesses, and which resulted in the condemnation of Claude, though his punishment was made exceedingly light on the ground of unquestionably extenuating circumstances.

The various attacks upon *Claude*, viewed in relation to *L'Homme-Femme*, were based on two distinct kinds. On the one hand it was contended that a gentleman who shot his wife, not as an adulteress, but as a "voleuse," did not in any way illustrate the practical force of the precept "Tue-la" as laid down in the pamphlet. On the other hand it was asserted that "Tue-la" itself was a mischievous mandate, and that zeal for the seventh commandment need not lead to the recommendation of an infraction of the sixth. There are laws against murder, and those laws ought to be respected. Foremost among the assailants of Claude was M. Cuvillier-Fleury, of the *Journal des Débats*, who is likewise a member of the Academy, and the letter written to him by M. Dumas constitutes the preface to the printed drama. One of the passages in the article to which the letter refers is certainly somewhat strong. Not content with forbidding (the expression is "Je vous défends de la tuer) M. Dumas to kill an erring wife, he thus questions his right to step forth as a moral teacher:—

A-t-il une longue expérience de la morale qu'il professe? A-t-il fait l'épreuve sérieuse des leçons qu'il donne? A-t-il droit ou crédit dans l'ordre philosophique, le crédit du prédicateur public, du législateur à mandat, du magistrat sur son siége, de tous ceux en un mot qui ont reçu de la société mission de l'édifier, de régler sa vie et d'apprécier ses actes? A-t il on a-t-il non un tel crédit?

These questions, which, to say the least of them, are not very discreet, inasmuch as they imply a denial of the right of everybody who does not belong to certain privileged sections of the community to express an opinion on any social subject whatever, M. Dumas very properly answers in the negative, adding that if he is without a right he means to take one, and giving his reason why:—

Pourquoi? Je vais vous le dire. Parce que, comme dit tout bonnement le proverbe, l'habit ne fait pas le moine. Il ne s'agit donc pas d'avoir reçu de la société mission de faire tels ou tels actes; ce n'est qu'une fonction cela; il s'agit d'avoir reçu de sa conscience ordre de faire telle ou telle action. . .

Referring to the case of Voltaire and Calas, he adds:—

Ce jour-là, ce sont les juges et les prêtres qui ont été des imbéciles, ou des misérables; c'est l'homme de lettres, sans mandat et sans siége, qui a fait fonction effective de prêtre et de juge.

At the onset M. Dumas certainly has the best of it; he is no doubt right when he asserts that his adversary, as the champion of law as it stands, is merely advocating a human institution, the value of which every one has a right to discuss; and when, unhappily, M. Cuvillier-Fleury assigns to La Fontaine a quotation which belongs to Voltaire, the little slip, though it has nothing to do with the main argument, affords M. Dumas an opportunity of correcting the mistake, and thus putting the foe, in his Academical capacity, in a somewhat funny position.

These are but trifles. The challenge of M. Cuvillier-Fleury elicits from M. Dumas a discourse of the most varied character, including an autobiography of his early youth, when he was the boon companion of his father, saw a great deal of "fast" life, and mingled in very questionable female society. He studied love as the chief agent in society, and as love generally is the leading motive in a modern drama, he thought the theatre was the place most fitted to his teachings. An exceedingly droll description of the plot of Corneille's *Cid*, too long to cite here, illustrates the predominance of love upon the stage, holding up the adored Chimène to universal execration. M. Dumas complains, not without reason, that, however he treats his pet subject, nobody is satisfied. When, in his *Dame aux Camélias*, he preached pardon to a Magdalen, he was accused of rehabilitating courtesans; now that he refuses pardon to Césarine, he is looked upon as the advocate of murder. No wonder that he considers himself hardly used.

In the case before us he cannot be accused of erring on the side of mercy, and he seems to have been urged to take up his present strong position by an Apocalyptic vision. He saw a Beast, with seven heads, clad in purple and scarlet, thus combining in one the two figures described by St. John in the Revelation (c. xvii.), and devouring all sorts of miserable victims:—

Au-dessus de chacun des sept diadèmes, au milieu de toutes sortes de mots de blasphème, flamboyait ce mot, plus gros que tous les autres: Prostitution. Or cette Bête n'était autre qu'une incarnation nouvelle de la femme, décidée de faire sa révolution à son tour. Après des millions d'années d'esclavage et d'impuissance, malgré les légendes du théâtre, cette victime de l'honneur avait voulu avoir raison de lui, et croyant briser les liens de l'esclavage en brisant ceux de la pudeur, elle s'était dressée tout à coup, armée de toutes ses beautés, de toutes ses ruses, de toutes ses faiblesses apparentes.

This Beast, the incarnation of "social evil," became particularly mischievous in France after the termination of the last war. Finding the country in a very disorderly condition, perceiving the people more ignorant, more divided, more enfeebled than ever, and regaled by the smell of powder, the roar of cannon, the miasma of death, she gathered new courage; and just when the Frenchman ought to have been most serious, she told him that, having behaved well and suffered much, he now ought to abandon himself to pleasure, of which she is the representative. The poor Frenchman hesitated,

and pointed to a wall on which the German had chalked the words, "Cinq milliards de dettes." This difficulty was solved at once. The Beast showed him a Hebrew capitalist, who on another wall chalked up, "Quarante-deux milliards de crédit." France was richer and better off than at any period of her life; and the fools, whose number, according to the statistics of M. Dumas, may be valued as equal to nine-tenths of the population, resolved to make up for lost time. So they worshipped the Beast with renewed vigour, and some of them married her.

The Beast, if we may trust M. Dumas, had a powerful ally, a man of iron will, who dwelt on the other side of the Rhine, and who, watching her triumph with pleasure, rubbed his hands, and said to his nominal master, "Your Majesty may now look towards the East; there is nothing more to fear from the West; *on y meurt*." Things having gone thus far, M. Dumas thought the time had arrived when the Beast ought to be killed; and Claude, who, in spite of his unlucky marriage, belonged to the best tenth of the population, was appointed to show the best way in which the difficult operation might be performed. In brief, Claude is France, Césarine is the Beast, and Cantagnac is—who M. Dumas will not precisely say. His insinuated explanation is given in his own words:—

Pourquoi ne t'ai-je pas dit tout de suite à quelle nation appartient cet homme (Cantagnac), c'était bien plus simple, au théâtre surtout, où l'on n'a pas de temps à perdre? Parce que je ne pouvais pas te le dire. Tu ne sais donc pas que nous sommes abaissés et déchus à ce point que nos actes eux-mêmes sont sous la censure de cet anonyme que tu n'as pas reconnu et dont tu devrais toujours sentir l'odeur dans l'air que tu respires. Tu ne te rappelles donc pas que l'an dernier, il nous a fallu retirer de notre exposition de peintures, avant même qu'elle fût ouverte, deux tableaux qui auraient pu lui déplaire, et, s'il y eût eu dans ma pièce le moindre mot qui le désignât positivement, il aurait exigé de nos gouvernants apparents qu'ils défendissent la représentation de cette pièce.

It seems then that the enemies of the dramatist did not know what they were attacking. While they thought Claude was a very cruel man to kill his wife, they little suspected that the object of M. Dumas was to inspire the Gaul with a patriotic hatred of the Teuton.

NEWMARKET AND ARABIA.*

WE are somewhat provoked with this book. It contains, no doubt, a good deal of truth; it comes just at the time when some such book is needed, and it abounds with valuable suggestions; but it is so onesided in its views, and so overloaded with exaggerations on behalf of a favourite theory, that it will probably do more harm than good.

There is a story told of some apathetic guest at Eaton who drove Lord Westminster's stud-groom into a frenzy of astonishment and disgust. When the immortal Touchstone was paraded for inspection, he listlessly asked, "Is he thoroughbred?" This question, had it come from Captain Upton, so far from being a slight, must have been looked upon as the highest compliment he could pay, seeing that, according to him, no thoroughbred horse exists now, or ever has existed, among our English racers; hence the bare possibilities implied in such an inquiry would at once have set Touchstone in a class by himself. But even that ambiguous compliment would not have been offered. For Captain Upton there is but one thoroughbred horse in the world, his unchanged and unchangeable Arab; any small portion of good blood to be found here is owing, almost entirely, to a single imported stallion, the well-known Darley Arabian. Now we ourselves are rather fanatics in the same direction; but our fanaticism, measured against his, is as a Sabbath day's journey compared with a voyage round the world. We are ready to believe a good deal in favour of the old English studs, and their Desert forefathers; but Captain Upton's creed is quite beyond us. For instance, we do not believe that, when the Ark grounded on Ararat, seven perfect Arabs stepped gracefully down over the dripping rocks, and made their way at once to Yemen. We do not realize the fact that Peleg and Joktan rode about the Wilderness on progenitors of the Darley Arabian. Nor do we think it discreet to twist Scripture into a catena of whimsical proofs all tending to show that the said Darley Arabian is in every respect superior to the Byerley Turk or the Godolphin Barb. Our opinion is a very different one. We look upon the word "thoroughbred" as merely a conventional term, and are satisfied that, if our running horses are not thoroughbred, neither, according to Captain Upton's ideal interpretation of the phrase, are the high-blooded coursers of the great Anezzah itself. From the naturalist's point of view we do not mean to dogmatize. Still, if our author were to ask Professor Owen or Professor Huxley whether a breed of horses consisting of bays, browns, chestnuts, blacks, greys, and whites, is more likely to be a primæval and homogeneous, or a composite and manufactured, race, we think we know what answer he would get. In the second place, looking at history, the first high-bred horses we meet with were not Arabs, but White Cilicians.

Whether the white variety, common enough in Arabia, may not inherit some of their blood, is, we think, a fair question, though we cannot answer it. So superior were they to all the other breeds then known, that they were accepted from that province by the Persian monarchs in lieu of all other tribute. It was out of their number that the sacred horses were selected to draw the chariot of the Sun. It was of them that Herodotus speaks when he describes the earliest recorded international race, and says, *αἱ δὲ κράτισται τῶν Θεττάλων ἱλίκουτο πολὺ ἀπὸ τῶν Μήδων*—a statement which our modern Turf reporters would probably paraphrase somewhat after this fashion:—"The representatives of the Persian stable made strong running from end to end, and polished off the cracks of Thessaly before they had accomplished half the distance." Now at this time all the available resources of that vast empire were swept together, as by some huge drag-net, into one place. No production, even of the remotest and most barbarous region, likely to be of use in the campaign, was left uncalled for or unexacted by the Great King. Still, Peleg and Joktan notwithstanding, the Arab contingent of Xerxes's army brought no horses into the field, but came mounted upon camels. What was the end of these White Cilicians? Could any remnants of the old stock be hunted up now? Were they ever known to and valued by the Romans? We rather fancy not. Cicero, proconsul there once, and a very sulky proconsul too, was not lucky enough to be born in Yorkshire. Had he been, he would have made it his business, and his pleasure also, to find out all about them. Unfortunately for us, however, instead of attending to really important matters, he would think and talk about nothing but himself and the ephemeral politics of Rome. Besides this, he knew nothing about action, except indeed that inferior branch of it which is connected with the Forum only, and not with the Turf. Mr. Disraeli, indeed, in one of his novels (the wondrous tale of *Alroy*, if we are not mistaken) affirms that the finest horse in the world is not the Arab, but the White Anatolian; where he fell in with these splendid animals he does not say—we suppose in the peerless stables of his friend Sidonia. If so, what a point he missed in *Coningsby!* How grandly it would have sounded if, after Sidonia's victory, he had chosen to reply, when asked about the pedigree of his mare, "Daughter of the Star":—"No, she is not an Arab, she is a White Cilician, one of the last descendants of that once Imperial race. The founders of that subdivision of our hereditary stud were presented to my ancestor by Artaxerxes Mnemon for lending him a million of staters (he happened luckily to have them about him) under circumstances of some delicacy, and that too when all the other Persian capitalists pleaded poverty, having a notion that the Royal recollection, so wonderful in other respects, just fell short of infallibility where such trifling personal debts were concerned." However this may be, we hope that the Committee now sitting will have Mr. Disraeli before them, to tell us all he knows about these White Anatolians; for, setting Cilicians aside, we have a long-standing prejudice in favour of our White Turks—Place's White Turk, the D'Arcy White Turk, and so on. We are sorry to lose entirely the white and grey horses that once, in very early times, constituted the majority of our runners; they are now altogether obliterated from the stud-book. And yet, unless we deceive ourselves, they often showed a stoutness and endurance peculiar to themselves and well worth preserving.

We fear that Captain Upton will hardly believe his eyes when he finds our opinion to be that not only the above-named White Cilicians, but also the North African horses, or Barbs, came of a more ancient stock than their Arabian cousins. The frequent victories obtained at the Olympic games by the rulers of Cyrene were owing, we fancy, to the superior stamina of their Barbs, matched as they were against half-bred animals from Laconia and Thessaly. When Sophocles invents a race, and an accident in it (something of the kind had probably happened shortly before), to account for the imaginary death of Orestes, the Libyan coursers of Cyrene are in front till the disaster happens. At any rate, for some of the finest odes of Pindar, notably for the Fourth Pythian, we are indebted to the Barbary horse. This Barbary horse, long after Pindar, long after Hannibal and Massinissa—with their impetuous onsets of Numidian cavalry—seems to have maintained his reputation. In a note on Lucian's Dialogue "Nigrinus" there is introduced a curious document, referring perhaps to the Hippodrome of Constantinople; we will, at any rate, assume it to do so. It seems imperfect; and Gronovius, who cites it from Jacobus Sponius, a learned antiquary of the seventeenth century, does not (it was unnecessary for his purpose that he should) enter into any explanations, nor does he give any date. In it, however, as far as we can make out, a certain Calidus, who was, like Hannibal, "a very pretty fellow in his day" and, we will not doubt, an honest and a distinguished member of the Golden Horn Jockey Club, preserves for the benefit of posterity a correct card of all his winning horses. Now a large majority of these are marked off as Africans; occasionally a Spanish, a Thessalian, a Gallic runner, interrupts the long catalogue of Barbs. It is, however, but occasionally. Africans, Africans, Africans—Cyrenæans, and so forth—almost monopolize the list; and, what is remarkable, not a single Arab is to be found in a bead-roll of seventy-one names. We admit that by itself this negative evidence is scarcely conclusive: yet surely, as far as it goes, it tends to fortify the arguments and support the opinions of those who, like Youatt, maintain on other grounds that the horse is not indigenous in Arabia, but of comparatively recent introduction. The modern Turfite may perhaps like to know what designations obtained in the stud of his Roman predecessors, and thus to reproduce before his imagination the bellowing of the Constantinople Palmers when they offered (as no doubt they would offer, even if the last Palæologus were arming himself in despair for his last battle, and the barbarians thundering at their gates) to lay 100 to 40 "agen anything" bar

---

* *Newmarket and Arabia: an Examination of the Descent of Racers and Coursers.* By Roger D. Upton, Captain late 9th Royal Lancers. London: Henry S. King & Co. 1873.

one. The old Patrician—whether he be of the green faction or the blue—names his horses well. Advola (the Flyer-in), an African; Sagittarius (the Archer), an African; Æther, an African; Pugio (Poniard), an African; Sica (Dagger), an African, are among the most conspicuous performers. The first three of these names seem more appropriate to speed, the last two, Dagger and Poniard, suggest a pun—but our better angel intervenes, and we blot it out. Under the blot, however, the word "Stickers" is still just visible, and there we leave it. Speaking seriously, however, we suppose it would be admitted generally that the true Arab, whatever his origin, is now, upon the whole, superior to the Barbs. And it is with horses of the nineteenth century that we have to deal, not with horses of the Book of Genesis. It is, therefore, to be wished that men like Captain Upton, who know a great deal about this matter, and whose opinions deserve respect, should confine their enthusiasm within reasonable limits. It is, *pace* Captain Upton, beyond all question that our English breed of running horses is the fastest in the world. No Arab ever seen in England can compete (for a single race or so we mean) with a good specimen of the English racehorse, notwithstanding that an immense amount of weight is, or was, conceded to him; but whether he is not superior to his European kinsman in endurance, in constitutional power, in soundness, in the ability to work on without giving way through hunger and thirst, and in a vigour kept up to extreme old age, is quite another matter. We think that a rule *nisi* should be granted against Favonius, Cremorne, and the other horses in possession, upon these points. Nor, as far as practical measures are concerned, is there much difference of opinion between Captain Upton and ourselves. Having but little confidence either in the Government or the Jockey Club, we would fain hope that some of our great landed proprietors may take the matter into their own hands, and give the experiment of breeding from pure Arabs a full and fair trial. They must, however, turn their backs resolutely on the existing Turf, forego all hopes of immediate gain, and race, if race they must, among themselves, for nominal prizes and marks of honour—for a wreath of wild olive, so to speak, such as Hiero and Arcesilaus sent their horses across the sea to contend for without counting the cost. They must also give their minds and their money towards procuring the finest and most genuine specimens of the breed; and this, we believe, is not impossible. The superstition of the Arabs against unlucky marks which have nothing to do with the real merits of the horse may stand their friend, even if the Bedouins decline to sell their own favourites in open markets.

We would, however, go further than Captain Upton. There are many other breeds of horses besides his darling Arab breed whose qualities we should like to see settled by careful experiment. Notably there are the breeds of Turkestan, so famous for the iron hardness of their hoofs and feet; the horses of Dongola, if they still exist, as described by Bruce; an almost unknown breed, differing from the Arab, and yet apparently of high blood, that is found in Soudan; a chestnut variety of the Persian horse, greatly esteemed by the Russians; and so on. Such experiments, in a few years, would settle once for all whether it will be better to confine ourselves to a single breed because, upon the whole, it is the best, or whether we should not also encourage a mixed race, in the hope of securing special advantages and avoiding special defects. For we need hardly tell Captain Upton that his extreme enthusiasm about the shape and make of the Arab is by no means universal. Many good judges of a horse declare that he is low before, not sure-footed, and with a shoulder almost always heavy, upright, and bad. Captain Upton would probably reply that they have never seen a true Arab, and know nothing about the matter. *Non nostrum est tantas componere lites.* We have dealt thus far with only one half of Captain Upton's subject, but we hope to return to his work on a future occasion.

CYLLENE.*

MR. SNEYD deserves credit for the not inconsiderable labour which he must have devoted to the production of this book. It would be an exaggeration to say that the labour has been entirely successful; but it is no exaggeration to say that there is nothing in these pages which the author need be ashamed of, though it may be that some years hence he will find that, when he proposed to himself to construct an English novel founded on "the victorious march of the Emperor Constantine, the battle of the Milvian Bridge, the fall of Paganism, and the establishment of Christianity as the State religion of Rome," he attempted a task beyond not only his, but almost any living writer's, powers. The late Lord Lytton, in the fulness of his strength, made an effort in the *Last Days of Pompeii* to reproduce the life of eighteen hundred years ago; and in the recently published drama of *Hannibal* a scholar of eminence has, with considerable vigour, attempted to breathe life into the dry bones of one of the most dramatic episodes in Roman history. But it may be questioned if either of these authors has really succeeded. Innumerable readers, no doubt, have yielded to the fascination of Lord Lytton's writing, and have followed in imagination the varying fortunes of Glaucus and Ione, the development of the story of the blind girl Nydia, the hideous life and death of Arbaces the priest of Isis; and they have been carried away by the dramatic skill with which the author has described one of the most terrible physical catastrophes known to history. But most scholars have condemned the book; and, not perhaps unjustly, have sneered at the superficial treatment of subjects dear to them, and with which they are as familiar as with events going on around them at the present day. On the other hand, a few scholars have read with interest and have commended Mr. Nichol's poem, admitting its rigid adherence to the classical type, its scholarlike excellence, and the careful rendering of the character of the great Carthaginian. But the poem has taken no hold of the popular imagination. Mr. Trollope's most commonplace novel has probably been read by more than double the number of people who have even heard of Mr. Nichol's *Hannibal*. And this is the difficulty which any author has to meet who tries to reproduce in fiction the life of classical times. If he is popular, scholars will condemn him; and if he is admired by the scholar world, he will fail to be popular. Antagonism between the learned and the popular ear is almost inevitable. If you speak to the initiated, the uninitiated do not understand you, and will not take the trouble to make you out; and if you speak to the latter, the former will call you Philistine, and will pass you by with careless contempt.

Mr. Sneyd cannot, we fear, be congratulated on having steered his course successfully between these two opposing forces. It may be that he has fallen a victim to both. Looked at critically, the book will please neither one side nor the other. It is too much of an historical prize essay to satisfy the public, and too much of a sentimental nineteenth-century love story to satisfy the scholars. Young ladies will shrink from the historical details of the symposium at Baiæ, and the horrors of the Flavian Amphitheatre. Young gentlemen will think the style Johnsonian, and the tone monotonous. They will prefer to read history, if they read it at all, in Gibbon. His epigrams are more amusing than Mr. Sneyd's very best writing. The obscure Latin of his notes is more enticing and not less accurate than the dogmatic English of Mr. Sneyd's. And there is a fine sense of doing something to improve yourself attaching to a real book of history which can never attach to the pages of a novel. Scholars, on the other hand, will pick holes in the classical allusions and explanations and in the historical grouping (and they will find no great difficulty in doing either), and they will characterize the book as both inaccurate and undignified. And both sides will come away with the idea that they have been reading "cram," and probably they will not be far wrong in such a supposition. The author must have spent many days in compiling all the information which he has brought together in these pages. "I have," he says, "in every instance drawn my inspirations from the fountain-head, especially from the colloquial Latin writers, the post-Augustan classics, the panegyrists, and ecclesiastical historians." Perhaps he might have spent his time more profitably. He could not well have spent it more conscientiously. Such assiduity in the compilation of a two-volume novel ought to have its reward. And perhaps the pleasure of living in imagination with Cyllene, and Cethegus, and Claudian, and the faithful Alcon, and of attempting to people again the wooded shores of Surrentum, or the villa at Aricia, or the town house at Rome with the darlings of his imagination, may have been a reward sufficient for the author, and he will be comparatively careless of the effect which his work will have. He is probably young, as this is his first work, and he will not consider the time as wasted. Ninety-nine men out of a hundred who rush abroad after taking their degrees and spend months in Italy, and months in Egypt, or it may be, further away from home, come back again with nothing but vague impressions of having been a long way from England, of having seen and done a great many things the recollections of which are flitting about confusedly in their minds, and of having generally enjoyed themselves. Mr. Sneyd has probably got all that, and a great deal more. If he has not done much good by writing this book, he certainly has done no harm. And if, as we suppose, he has really enjoyed the writing of it, he may have the full benefit of the reflection that, if he might have done more with his time than he has done, ninety-nine men out of a hundred under similar conditions would have done much less.

The outline of the story is simple, but the filling in is, not to use a stronger expression, intricate. Cyllene, the beautiful daughter of Cethegus—a well drawn type of the Roman stoic of the post-Augustan age, consistent in his life and his self-inflicted death, and dignified in his funeral obsequies—is beloved by Claudian, a centurion in the confidence, and afterwards in the service, of the Emperor Constantine. He has the misfortune (during the earlier part of the book) to be a Christian; but, irrespectively of that, Cyllene returns his affection, and they spend some happy days together among the olive groves of Surrentum with the approbation of Cethegus. But Numerian, prefect of the Prætorians, a man of influence with Maxentius, also loves Cyllene, and he has never yet been thwarted in any of his fancies. With such a keynote it is not difficult to fill in the music. The different stages of the story run on like the scenes of an opera, and most of the "situations" are more suggestive of the libretto of an opera than of a staid and respectable classical novel. Claudian is an early Christian, and deports himself accordingly. Numerian is cruel, treacherous, and unscrupulous, a Pagan of the worst days of paganism. Claudian is arrested among the olive groves of Surrentum, at Numerian's instigation, and condemned as a Christian. With many others of his sect his sentence is to fight himself to death with trained gladiators in the amphitheatre. To all appearance he succeeds in carrying out this sentence under Cyllene's loving eyes, and he disappears until the end of the last volume. Cyllene is still safe from Numerian under the protection of her

* *Cyllene; or, the Fall of Paganism.* By Henry Sneyd, M.A. London: Longmans. 1873.

father, and he accordingly is the next victim. A citation on a charge of conspiracy is served upon him at Aricia. He knows that his fate is sealed, and therefore, like a noble Roman as he was, he prefers euthanasia. A favourite mastiff and a faithful slave are still in the way, but after they are both despatched Numerian sees no obstacle to his success. He had overlooked the Catacombs, to which Cyllene had fled, and Christianity, which had received her into its bosom. By the blackest treachery he is on the point of overcoming even these difficulties, when the battle of the Milvian Bridge comes off somewhat unexpectedly, and, like the statue in the opera, puts an effectual check on Numerian's designs. He falls fighting along with his Prætorians on the banks of the Tiber, and Claudian appears victorious at the head of a "maniple," or some other division, of the army of Constantine. Poetical justice is thus satisfied. In this life even the Christians succeed to happiness, and the pagans are confounded. After all their troubles by earth, air, fire, and water, Claudian and Cyllene are united, and settle down to domestic life by "the blue waters of the Bosphorus," very much as a true-hearted hero and a persecuted heroine of the middle classes would have settled down about the time of Pamela in a semi-detached villa at Twickenham or Putney.

From this sketch of the story it is manifest that no objection can be taken to the character of the book. It is propriety itself. And, as young men and young maidens write nowadays, that is no small recommendation. But there is a good deal more to say in favour of it. The characters of both Cyllene and her father are carefully and successfully drawn. The scenes at Surrentum and at the country house at Aricia are graceful and full of feeling. The writing, though pompous in some places, is always clear, and, so far as we have noticed, accurate. But what is perhaps the highest merit of the book is the honest and simple religious tone that runs through it without disfiguring it by either cant or folly. "In the undercurrent," the author says, "which flows through the book, expression is given to the hope—vain perchance—which found a place in the breasts of such pagans as Cicero and Seneca, that the day may yet come when creeds shall cease to divide men with the strict line of demarcation which now exists." It is as pleasing as it is rare at the present time to meet with this spirit, or indeed with any spirit of reverence, in a young University man's first efforts, either in prose or verse. For, in those latter days, when childish philosophies, impracticable theories, and spurious religions take possession of youthful minds—when æstheticism is exalted into a holy revelation, and sensuality into a form of divine worship—the utmost that modest believers in Christianity can look for in the works of favourite authors is a decent covering thrown over the bones of what it is the fashion to regard as a kindly superstition.

NOTICE.

We beg leave to state that we decline to return rejected communications; and to this rule we can make no exception.

The SATURDAY REVIEW *is duly registered for transmission abroad.*

The publication of the SATURDAY REVIEW *takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.*

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 915, MAY 10, 1873:

The Imperial Meeting at St. Petersburg.
Mr. Stansfeld's Proposals. Bath and Gloucester Elections.
French Prospects. Sir Charles Dilke's Motion. Judicial Peerages.
The Debate on the Permissive Bill. Debtors and Charity.
Andrews v. Salt.

Alphonso's Wish.
Fellowships and Liberal Education. The *Times* and the Artists.
City Churches. Couriers for Vienna. Asylum Management. The Grocers Again.
Religious Affairs in Germany. The Royal Academy.
Hamlet at the Crystal Palace.

Dr. Mansel. The Palms of Memory.
The Fortescue Papers. Old Kensington.
Slave-Catching in the Indian Ocean. The Military Strength of Russia.
La Femme de Claude. Newmarket and Arabia.
Cyllene.

CONTENTS OF No. 914, MAY 3, 1873:

Mr. Smith's Motion—M. Barodet's Victory—Women Voters—Progress of Revolution in Spain—The Judicature Bill—The Emperor's Will—Irish Railways—The Vienna Exhibition—The Liberation Society.

Ages of Man—Nature-Worship—Letters to Young People—The Sanitary Digest—The Coral-Fishers of Capri—Mr. Macready—Mr. O'Keeffe on Ultramontanism—The Royal Academy—The Two Thousand Guineas.

Alexander von Humboldt—Dixon's Two Queens—Etruscan Inscriptions—Squire Bichester's Whim—Symonds's Records of the Rocks—Hughes's Memoir of a Brother—May—French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

CRYSTAL PALACE.—PARTICULAR ATTRACTIONS.
THIS DAY and NEXT WEEK.
Saturday (May 10).—First Grand Summer Concert, at 3.
Monday.—Shakspeare's "Hamlet," at 2.30.
Tuesday.—Opera, "Don Giovanni," at 3.
Wednesday.—"Hamlet," at 2.30.
Thursday.—Opera.
Saturday.—Great Flower Show.
The Fine Arts Courts and Collections, including the Picture Gallery (the Works on Sale), the Technological and Natural History Collections, all the various illustrations of Art, Science, and Nature, and the Gardens and Park always open.
Admission, Monday to Friday, 1s.; Saturday (May 10), 5s.; Saturday (May 17), 7s. 6d.; or by Ticket purchased before the day, 5s. Guinea Season Ticket free.

ALEXANDRA PALACE will be OPENED on

SATURDAY, MAY 24.

SIR MICHAEL COSTA will conduct a GRAND CONCERT.

INTERNATIONAL FLOWER SHOW commences May 24.

ALEXANDRA PALACE and PARK, MUSWELL HILL, N.

THE SOCIETY of PAINTERS in WATER-COLOURS.—The SIXTY-NINTH ANNUAL EXHIBITION is now OPEN, 5 Pall Mall East, from Nine till Seven. Admittance, 1s. Catalogue, 6d.
ALFRED D. FRIPP, *Secretary.*

INSTITUTE of PAINTERS in WATER-COLOURS.—The THIRTY-NINTH ANNUAL EXHIBITION is now OPEN. Gallery, 53 Pall Mall. Admission, 1s.
JAMES FAHEY, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Triumph of Christianity," "Christian Martyrs," "Francesca da Rimini," "Neophyte," "Andromeda," &c., at the DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

PICTURES in the LOUVRE GALLERY.—ON VIEW, a Collection of fine AUTOTYPE PRINTS from the principal *chefs-d'œuvre* in this celebrated Collection.—AUTOTYPE GRAND FINE ART GALLERY, 36 Rathbone Place (Next door to Winsor & Newton's).

ROYAL LITERARY FUND.—The EIGHTY-FOURTH ANNIVERSARY DINNER of the Corporation will take place in Freemasons' Hall, on Wednesday, May 28.
The Right Hon. W. E. GLADSTONE, M.P., in the Chair.
First List of Stewards.

The Earl of Aberdeen.
His Grace the Duke of Argyll, K.T.

Bankers.

LONDON AND WESTMINSTER BANK, and their Branches.
THE BIRMINGHAM BANKING COMPANY, Limited, Birmingham.
THE MANCHESTER AND COUNTY BANK, Limited, Manchester.

Solicitor.

JOHN HOLMES, Esq., 31 Clement's Lane, London.

OFFICES—INNS OF COURT HOTEL, HOLBORN, LONDON.

ABRIDGED PROSPECTUS.

This Company is formed to purchase the important property known as the INNS OF COURT HOTEL, Holborn, with the option of acquiring the unfinished building connected therewith in Lincoln's Inn Fields, in close proximity to the new Palace of Justice, now in course of erection.

This great Hotel has recently undergone extensive alterations, and now compares most favourably with any first-class hotel in London.

It is a matter of public notoriety that, by order of the Court of Chancery, the entire property was sold last year for less than one-third its cost.

Preliminary arrangements have been entered into to acquire, for the sum of £30,000, a lease of the Hotel for a term of 30 years, at a ground-rent of £1,350 per annum. The furniture, fixtures, fittings, and other effects, upon which about £20,000 has been expended, are to be taken upon payment of the sum of £10,000, or at a valuation, at the Company's option. The Company will also have the right of acquiring the unfinished building, fronting Lincoln's Inn, communicating with the Hotel, upon terms equally advantageous.

It will be remembered that the Langham Hotel was purchased by a Joint-Stock Company for about half its original cost, under circumstances somewhat similar. The last dividend paid to the proprietors in that undertaking was at the rate of 15 per cent., besides funds also additions to the reserved funds.

The Directors invite careful consideration and investigation of this undertaking, believing as they do that, with prudent and vigilant management, a sound and profitable investment is offered, based upon substantial and improving property.

The Contract, with Copies of the Memorandum and Articles of Association, and of the Certificates as to value of Messrs. LOCKWOOD & MAWSON, and Mr. WYNNARD THOMAS STEWARD, of the firm of HUNT & STEWARD, may be seen at the Offices of the Solicitor.

Full Prospectus and Forms of Application may be obtained of the Manager, Mr. ROSSALL, at the Hotel; of the Directors or Solicitors.

THE AGRA BANK, Limited.—Established in 1833. CAPITAL, £1,000,000.

HEAD OFFICE—NICHOLAS LANE, LOMBARD STREET, LONDON.

BRANCHES in Edinburgh, Calcutta, Bombay, Madras, Kurrachee, Agra, Lahore, Shanghai, Hong Kong.

Current Accounts are kept at the Head Office on the Partnership terms with London Bankers, and Interest allowed when the Credit Balance does not fall below £100.

Deposits received for fixed periods on the following terms, viz.:

At 5 per cent. per ann., subject to 12 months' Notice of Withdrawal.
For shorter periods Deposits will be received on terms to be agreed upon.

Bills issued at the current exchange of the day on any of the Branches of the Bank, free of extra charge; and Approved Bills purchased or sent for collection.

Sales and Purchases effected in British and Foreign Securities, in East India Stock and Loans, and the safe custody of the same undertaken.

Interest drawn, and Army, Navy, and Civil Pay and Pensions realized.

Every other description of Banking Business and Money Agency, British and Indian, transacted.

J. THOMSON, *Chairman.*

THE STANDARD LIFE ASSURANCE COMPANY.

The Forty-seventh Annual General Meeting of the Company was held at Edinburgh on April 29, 1873.

Results communicated to the Report.

Amount proposed for Assurance during the Year 1872 (2,353 proposals)	£1,126,666 3 4
Amount of Assurances accepted during the Year 1872 (1,985 policies)	1,140,153 19 0
Annual Premiums on New Policies during the Year 1872	40,460 13 2
Claims by Death during the Year 1872, exclusive of bonus additions	238,249 16 9
Amount of Assurances accepted during the last Five Years	5,627,563 1 1
Sum sting Assurances at 15th November, 1872 (of which £283,419 11s. is re-assured with other Offices)	17,944,634 8 2
Revenue, upwards of Seven Hundred Thousand Pounds per annum.	
Assets, upwards of Four Millions sterling.	

The STANDARD LIFE ASSURANCE COMPANY was established at Edinburgh in 1825. The Acts of Parliament, 2nd and 3rd Geo. IV. (cap. 67, and 9th and 10th Vict., cap. 73, also 32nd and 33rd Vict., cap. 27, have been granted for the purpose of its constitution and for the regulation of its affairs. It has been conducted with much success, and that result may be attributed not only to the extensive and influential connexions of the Company, but more particularly to the liberality of its dealings, and to the constant attention paid by the Directors to the adoption of improvements and facilities in connexion with the contract of life assurance.

BONUS ADDITIONS TO POLICIES.

The Company have divided Profits on eight occasions, in 1835, 1840, 1845, 1850, 1856, 1860, 1865, and 1870, when very large additions were made to Policies.

The next division of Profits will be made in 1875.

WILL. THOS. THOMSON, *Manager.*
H. JONES WILLIAMS, *General Secretary for England.*

THE

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 916, Vol. 35. May 17, 1873. [Registered for Transmission abroad.] Price 6d.

ITALY.

ITALY, like England, has lately had a Ministerial crisis, and the Italian, like the English crisis, has ended in the same Ministry returning to office because no other Ministry was prepared to take its place. The origin of the Italian difficulty was not what would have seemed at first sight an adequate one. There was no grand debate, no array of Ministerial and Opposition forces, no canvassing in the country of a point of public interest. Those who made the Ministry fall had no conception of what they were doing; and the Ministry certainly appears to have been to blame for not calling attention beforehand to what it thought to be the importance of the issue. Still the issue was of very considerable importance, and the firmness shown by the Government, and especially by the MINISTER of FINANCE, whose department the vote concerned, is likely to have a very wholesome effect. The MINISTER of MARINE had recommended that a sum of six millions of francs should be expended on the arsenal of Taranto. As usual, the proposal was referred to a Committee, and the Committee did not think that the expenditure was nearly large enough for the object in view, and advised that twenty-three, instead of six millions, should be devoted to the arsenal. The Bill, as modified by the Committee, came before the Chamber, and the clauses granting the sum, as increased by the Committee, were voted without any formal division being taken. Only one of the Ministry was in the House, no serious remonstrance was made, and although those who voted the money knew they were voting more than the Government thought it wise to ask for, they had no reason to apprehend that any serious question of Ministerial policy was involved. After the vote of the sum had been taken, and before the remaining clauses came under discussion, Signor SELLA, the Finance Minister, rushed into the House and stated that the Ministry regarded the course taken by the Chamber as so fatal a blow to the Government that it must ask for an adjournment in order to consider its position, and the next day the Ministers placed their resignation in the hands of the KING. It was in vain that some of those who had joined in defeating the Ministry protested that they had no wish to defeat it, and only had voted as they had done because they considered that the question before them was one which every Ministry would naturally regard as an open one. But the MINISTER of FINANCE insisted on resigning, and he is so incontestably the ablest and most influential man in the Ministry that his colleagues had no choice but to leave office if he left it. What he urged was that Italy above all things must assure its financial position, and that he had been working out a policy for years by which the finances of the country were gradually being placed on a sound footing. It was fatal to such a policy, if the Chamber took on itself to spend seventeen millions more than he could find money for, while it invariably threw every possible obstacle in his way if he proposed new taxes. There can be no doubt that he was right. The sum in question was not very large. The expenditure of the twenty-three millions was to be spread over ten years, so that the Committee had only pledged him to find about 80,000*l.* sterling a year. But every halfpenny has to be watched with the most jealous vigilance if a country like Italy, with so many burdens to bear and so many obstacles to overcome, is ever to see the day when the accustomed deficit will disappear. The Chamber must support the Government in adhering to the paths of rigid economy, or Italy will never be solvent; and SELLA was, no doubt, quite right in saying that he could not regard even 80,000*l.* a year as a trifle, and that to cast the necessity of finding it on him would derange all his plans. It was quite worth a Ministerial crisis in order to have it solemnly recorded that the Chamber must not interfere in the direction of extravagance if it wished to uphold the national credit. Where, according to English notions, we should have thought the Minister erred, was not in attaching so great an importance to the vote, but in letting the vote be taken in his absence, and without any attempt beforehand to explain to the deputies the real gravity of the step they were taking.

The cause of the resignation of the Ministry appeared to many observers so inadequate that they conceived it to have had a deeper design than was suffered to show itself. The great Bill of the Session—the Religious Corporations Bill—was on the eve of coming on for discussion; and it was known that a large portion, and probably the majority, of the deputies was opposed to it on the ground that it did not deal with those corporations in a sufficiently sweeping and wholesale manner. It was suspected that the Ministry went out of office on an insignificant question of finance in order that either they might escape from the disagreeable task of having to press on a measure the success of which was doubtful, or that, if they resumed office, they might be able to bargain that they should be supported in their Religious Corporations Bill. As a matter of fact, all the statesmen to whom the KING applied to form a Ministry replied that no change of Ministry was really possible, as the suspense in which the public was being kept as to the fate of the Bill was creating a dangerous agitation, and no other Bill than that of the Ministry which had just resigned could be prepared without great loss of time. Signor LANZA, too, the President of the Ministry, whose part in the Government of which he is the nominal chief is to watch the combinations of friends and enemies, and to fill in a dignified manner the post of a Parliamentary Whip, had interviews, before he would resume office, with many persons as to whose course in regard to the Religious Corporations Bill he was in doubt. Although, therefore, the earnestness with which SELLA protested against interference with his financial policy is too much in harmony with his character and antecedents to make the suspicion admissible that he was feigning or exaggerating in order to serve a remote purpose, it is apparently true that the crisis has been very useful to the Ministry in smoothing the way for the progress of their great measure. The Government has all along set itself to frame a Bill with regard to the Religious Corporations which, without departing from the recognised doctrines of Italian statesmanship, should yet make it possible to avoid an open breach with the POPE and the Papal party. Their original proposals were referred to a Committee which judged them too vacillating and timid, and amended them so as to make them more vigorous and decisive, and so as to embody in them incontestably the three fundamental tenets of Italian Liberals as regards such bodies—that the State shall judge which of them, as subserving no object of public utility, shall be dissolved; that their buildings shall be subject to expropriation for public purposes; and that they shall cease to hold lands, an equivalent in the funds being given them. The Government has subsequently adopted the recommendations of the Committee, and virtually it is the Bill of the Committee that the Chamber has now under discussion. But the Bill is avowedly moulded on the assumption that the position of the POPE in Rome is to be accepted to some degree as an exceptional one, so that privileges shall be allowed to religious corporations in Rome which would not be permitted to exist in any other Italian town. The Minister for Foreign Affairs, Visconti VENOSTA, in introducing the Bill, stated with perfect frankness the views of the Government on this head. Italy, he urged, must recognize the cosmopolitan character of the POPE's government, and must leave him the necessary machinery of his rule. The Government thought it quite right to take the buildings of the Orders when necessary, and to resume Italian land from their administration; but it could not refuse to acknowledge

that the Generals of these Orders were the instruments through which a vast spiritual dominion was worked, and they thought that the POPE, if he was not to be driven into exile, must find in Rome the means of carrying on his government. The Minister was also able to add an argument which he hoped might catch the fancy of his hearers. The heads of the clerical party, he observed, while they carried on their spiritual government from Rome, became naturally absorbed in the management of a vast variety of business outside Italy, and had not much leisure for hampering and thwarting the Italian Government. But if it became impossible for them to find the machinery of government in Rome, they would devote their energies to carrying on a much more active warfare against the new order of things in Italy, and it would give them a great advantage to start with if they could show that they had a distinct grievance, and had been violently prevented from doing in the sphere of spiritual affairs what the interests of the Church required.

The tactics or the arguments of the Ministry have produced a considerable impression, and the prospects of their Bill are now said to be much brighter than they were. They have also received some kind of help from two very different quarters. The POPE appears to be anxious not to push his quarrel too far, and is more conciliatory than usual at a time when, if he were as profuse in execrations as has been his habit, he might easily make the passing of a Bill impossible which, bad as he must think it, is a great deal better than the measure which, if the present Italian Government were defeated, would be sure to be substituted for it. On the other hand, the Chamber has been alarmed and disgusted by the violence of a foolish mob which gathered together in order to protest against the Bill as far too favourable to the priests, and which, after driving a statesman so well known as MINGHETTI to seek refuge in a barrack, had to be dispersed by the troops, not without loss of life. Deputies who have been inclined to sympathize with the popular feeling in favour of a stronger measure will be inclined to learn from this practical lesson that mobs are not the best judges of what ought to be done to solve the critical and complicated questions which the new relations of Italy and the Papacy force on the attention of statesmen. It is satisfactory to find that the Government showed itself both calm and firm, and that it inspired full confidence that order would be maintained. A similar demonstration was, indeed, prohibited at Naples without any opposition, and in several instances the Government has recently shown that it can uphold the law as between the priests and their enemies, and can make both parties respect it. The Bishop of MANTUA, for example, has lately been sentenced to be imprisoned and fined for preaching a sermon calculated, in the language of Italian law, to bring the institutions of the country into contempt, and to stir up the hatred of one class against another. On the other hand, a few days ago there was a pilgrimage to Caravaggio, attended by sixty thousand persons and headed by seven bishops, which was conducted without the slightest disturbance of the peace—a state of things which fervent Catholics in many French towns may regard with honest envy. A Government which can both punish priests and protect them is exactly what the Italians want, and the respect it awakens must make it easier for their Bill to pass. Nor has the good fortune which seems always to befriend Italian Ministries been wanting at this crisis to the present Government. At a moment when there must be many Italians who are not quite sure whether they ought to go so far as is proposed in restricting the power of the Church, a band of French pilgrims under the leadership of a Viscount DAMAS has thought fit to wait on the POPE and assure him that, if things go on well, France will soon be down on Italy, rescue Rome from the grasp of sacrilegious men, and give the POPE his own again. The POPE was very guarded in his reply, and took care to say nothing that could make the Italians think he was looking for the advent of these new Cru-aders. But the mischief was done, and although the organs of Italian opinion said very truly that there was no great reason to fear lest France should go to war in such a cause, yet they appealed naturally enough to the sentiments of national independence, and patriotism will make waverers resolve that they will not hesitate under the threats of foreigners to help in fulfilling the wishes of Italy.

MR. STANSFELD ON BOUNDARIES.

MR. STANSFELD'S Committee will not find the readjustment of local boundaries an easy task. As Mr. CROSS reminded the House, modern divisions have been made with an express regard to practical convenience. The shape of the country, the direction and character of roads and railways, and many other circumstances, must be taken into consideration in the formation of a Union, and the accidental connexion for purposes of relief of parishes situated in different counties has been found, as might have been expected, entirely unobjectionable. Mr. STANSFELD prudently shrinks from altering the boundaries of counties for political purposes, which seem to consist exclusively in the return of members to Parliament. As all large counties have long since been subdivided into electoral districts, the unity which Mr. STANSFELD proposes to retain will be entirely imaginary or nominal. The administrative county will be merely an aggregation of parishes or Unions, without a recognized name, and without traditional associations. The substitution of departments for the old French provinces was a part of the revolutionary policy of breaking off all connexion with the past. As the year was to date from the establishment of the Republic, and as weights and measures were remodelled under new and barbarous names, it was perfectly consistent to transform Normandy and Gascony into a certain number of administrative districts. No change could be more disagreeable to English feeling than the abolition of the existing division of the kingdom into counties; but the experiment must be tried if the scheme of Local Government which Mr. STANSFELD apparently intends to frame is adopted by Parliament. Mr. GOSCHEN'S Bill of 1871 provided local governing bodies to be constituted on an ascending scale by a double or threefold system of election from parishes to counties. If the project is revived, it will evidently be indispensable to include the constituent parts within the boundaries of the county or department. Mr. STANSFELD proposes to make a single rate, to be afterwards distributed according to certain rules between the larger and smaller administrative districts. There may be much advantage in a uniform valuation for all purposes of local and general taxation; and if England were a new country ready to be cut into squares like the more modern States of the American Union, it would be unwise to invent anomalies, or to allow one boundary to overlap another; but as long as the counties have any practical existence, an artificial symmetry can only be obtained by arbitrary disregard of practical expediency.

The withdrawal from the Justices assembled in Quarter Sessions of their financial functions has long been foreseen. They are more liberal, better informed, and altogether more competent to their duties than their probable successors, but they have the merit or the misfortune of not having been elected. As the principal inhabitants of counties, the magistrates on the whole virtually represent property and intelligence; and experience shows that in questions of expenditure they incline rather to parsimony than to extravagance; but county financial Boards may probably be more popular, and all parties have at different times countenanced a change which perhaps none of them heartily approve. The County Board of the future must represent all the parishes and Unions within the limits of its jurisdiction; and consequently new counties must be created for the purpose. The opposite process of cutting up Unions which extend into more than one county would in many cases cause grave inconvenience. It is for the most part indispensable that the elected Guardians should frequent the same market town, so that they may combine the discharge of their official duties with the transaction of their private business. In a few instances the boundaries of Unions may require re-arrangement; but wherever an alteration is necessary, it is not likely to promote the coincidence of boundaries which Mr. STANSFELD thinks desirable. It may on the whole be assumed that the Committee will approve the proposal to form new administrative counties; but it may be doubted whether the House of Commons will sanction the innovation. Every county is proud of itself and of its history; and its inhabitants will feel that it has no longer a reason for existence when it has nothing to do but to return one or more sets of members to Parliament. The Guardians of Unions will in all probability form the constituency which is to elect the County Board; nor is it easy to devise a better provincial constitution if the local government is to have a representative character. The change is not absolutely necessary as a condition of uniformity of taxation. The county rate is at present levied with the poor rate, and where a Union extends into more than one county, no difficulty is found in appropriating to their proper destination the contributions of the various parishes. In general it may be said that the readjustment of boundaries is required, not for the correction of practical abuses, but as a step to the

establishment of a new system of local government. If Parliament should eventually determine on maintaining the actual limits of counties, Mr. STANSFELD or his successor will be compelled to devise some different scheme of local administration.

If all other difficulties are overcome, the Committee, whatever ability and industry it may exhibit, must necessarily delegate to others the most important part of its work. It is only by local inquiry that the most convenient boundaries can be even approximately determined. Administrative districts marked out on an ordnance map would be probably more anomalous than the historical counties which they are to supersede. Ambitious nations have sometimes selected mountains, and sometimes rivers, as natural boundaries, according to their own interests, and they have the excuse that both one barrier and the other may, according to circumstances, really form a practical line of separation. In a low country a large river crossed by bridges only at infrequent intervals sometimes divides the inhabitants of either bank from one another for all ordinary purposes of society and business, although they may by accident be politically united in the same country. In hill countries, on the other hand, although streams may be difficult of passage, each river basin holds a single community, while valleys at moderate distances from one another have no connexion by practicable roads. Some counties are for many miles divided by rivers, while for all kinds of traffic the dwellers on both sides use the same common road. In modern times railways have in numerous cases surmounted natural obstacles of mountain and river, bringing together communities which had been distant from time immemorial. It is probably rather with a view to the avoidance of opposition than from sanguine belief in the competence of a Parliamentary Committee, that the Government has delegated to others a task which it could have itself performed more efficiently. The reports of Commissioners instructed to collect information on the spot must necessarily be the foundation of any scheme for the readjustment of boundaries. When Parliament had determined on adopting the principle of the Municipal Corporations Bill, Commissioners were sent to fix the boundaries of every borough to the best of their judgment. The same course will inevitably be adopted in the demarcation of new counties, when Parliament has authorized the change. Mr. STANSFELD scarcely seems to appreciate the difficulty of creating new counties overlapping the boundaries of the old. He had, it is true, only a choice of embarrassments, for the House of Commons would almost certainly have rejected a proposal for the abolition of the ancient division into counties; but the same end will be gradually attained if new administrative districts of similar magnitude are created. If local government is to be uniform, the commission of the peace must be issued with respect to the new districts rather than to the existing counties; yet it will be awkward to create lord-lieutenants of nameless aggregations of parishes.

MR. O'KEEFFE AND THE HOUSE OF COMMONS.

BY a very small majority the House of Commons has decided to allow the discussion on the treatment of Mr. O'KEEFFE by the National Board to be postponed until the members of the Board whose conduct has been impugned have had an opportunity of defending themselves before a Select Committee. Mr. BOUVERIE, towards the end of last Session, when the vote for National Education in Ireland was proposed, took the opportunity of moving what amounted to a direct vote of censure on the Commissioners, and he only withdrew it because Mr. GLADSTONE, who gave him plainly to understand that he also thought the Commissioners to blame, appealed to him not to prejudge the matter before the Commissioners had had time to reconsider their course of action. The Commissioners took time to reconsider it, and resolved to persevere. They had dismissed Mr. O'KEEFFE from the managership of the Callan schools, and, as they held that they had rightly dismissed him, they declined to rescind their vote. Mr. BOUVERIE accordingly gave notice early this Session that he would again bring forward his vote of censure on the Commissioners; but he was induced to adjourn it until the documents bearing on the question had been printed and placed in possession of members. These documents have now been printed, and Mr. BOUVERIE's motion was coming on for discussion next Tuesday, when suddenly the Government interposed, and on Thursday night asked that, in accordance with a request of those Commissioners whose votes had determined the action of the Board, a Select Committee might be appointed to hear what these Commissioners had got to say. The Government supported the appeal of the Commissioners on the ground that men ought not to be condemned unheard. It was precisely, as Mr. CARDWELL pointed out, for not hearing Mr. O'KEEFFE before they condemned him that it was proposed to censure the Commissioners, and it would be highly inconsistent if the House subjected them to the very treatment which the House is asked to censure them for having applied to Mr. O'KEEFFE. When a Government proposes that men shall be heard before being condemned, very strong influences make the House ready to concur. To refuse is at once to defeat the Government and to incur the reproach of acting unjustly. The House accordingly assented to the proposal of Lord HARTINGTON on Thursday night, but it did so very reluctantly. Nor is this reluctance at all inexplicable. It is very easy to see how the course pursued by the Commissioners threatens to rob the House of its power of pronouncing its opinion on any point of public interest where the conduct and character of individuals are concerned. If the facts are obscure or contested, it may be necessary that a Select Committee should investigate them; but here there is no doubt at all about the facts. The Board has been for a whole year engaged on the case, and everything bearing on it has been elicited and put into print, and any member who chooses may read all that there is to be said about it. What the Commissioners say they fear is lest their motives should be misunderstood. Nothing can be clearer than the general reasoning on which they proceeded, and the only question is whether it was right or wrong. What they now ask is that the hands of the House shall be tied until thirteen Irish gentlemen have had an opportunity of explaining their motives to a Select Committee. The concession of their request may easily, unless care be taken, establish a very dangerous precedent. Persons whose conduct is to be impugned in the House of Commons can wait until a day or two before what they have reason to fear will be an adverse vote is taken, and then claim to have the case stand over until they have explained to five members in a committee-room, not what they have done, but why they think what they have done is right. As it happens, the Commissioners have explained all their motives over and over again, in every possible sort of way. More especially Chief Baron PIGOTT has recently issued a pamphlet explaining and enforcing the views of the Commissioners attacked in a perfectly exhaustive manner. If the Commissioners wish to explain their motives to the Select Committee, they cannot do better than each read the CHIEF BARON'S pamphlet to their afflicted hearers. It certainly seems a manœuvre of which the House may be reasonably apprehensive, that men on whom a vote of censure stands for immediate discussion should manage to avert the blow until the substance of a pamphlet, which any one might get through in half an hour, has been gone through thirteen times in a room upstairs.

The Commissioners seem to be afraid of having the judgment of the House pronounced on their conduct, and it is natural therefore to suspect that their case is weaker than they would willingly allow. The Government, too, is certainly not very strongly prepossessed in their favour. Mr. GLADSTONE last Session had not a word to say in their defence, and on Thursday he gave no reason to suppose that his opinion was changed; while Lord HARTINGTON and Mr. CARDWELL, the only Ministers who took part in the debate, carefully abstained from any expression which could be taken as signifying that in their opinion the Commissioners had acted rightly. But the Commissioners seem really to have a very fair case. In the first place, there is no pretence whatever for saying that the question was one between subserviency to Ultramontanism and Protestant or Catholic independence. The final action of the Board was determined by a majority of eleven against seven. Of the eleven who constituted the majority, five were Protestants, and among the Catholics was the CHIEF BARON, who has always been one of the staunchest supporters of the Queen's Colleges in opposition to the hierarchy of his Church. The only real point in issue is whether, when the Board received a certificate from the Roman Catholic Bishop of OSSORY to the effect that Mr. O'KEEFFE was suspended, they were right in treating this certificate as conclusive, and in refusing to recognize Mr. O'KEEFFE as parish priest of Callan until the suspension was removed. It is said that they ought to have deferred action until they had heard what Mr. O'KEEFFE had to say on the matter, and that they should have imitated the course taken by the Poor Law Board, which removed Mr. O'KEEFFE from the chaplaincy of the workhouse in consequence of his suspension, but did not do so until they had communicated with him. The Poor Law Board, however, did not do anything more than allow

Mr. O'Keeffe an opportunity of showing, if he could, that the certificate of his Bishop was not a genuine document. They entirely declined to allow him to go into any further question, and removed him from his chaplaincy long before the National Board removed him from his managership. But the National Board did really as much for Mr. O'Keeffe as the Poor Law Board did; for they informed him that he was removed from the managership because a certificate of his suspension had been received from his Bishop, and if this certificate had not been really given by the Bishop, Mr. O'Keeffe would at once have said so. What those who complain of the action of the Board mean by saying that Mr. O'Keeffe ought to have been heard before he was condemned is, that he ought to have been allowed an opportunity of showing that he had not been properly suspended. To this the Board reply that it has been their invariable practice, established repeatedly by precedents, to accept the certificate of the ecclesiastical superior of the manager as final, and they have acted on this principle in dealing with Presbyterians as well as with Catholics. If they did not do so, they would have, it is said, to try the propriety of the course taken on each occasion by the heads of each religious body. They would have to pronounce judgment on cardinals and bishops, and elders, and assemblies, and, to say nothing of their having no adequate machinery for such a task, they could not carry on the system of mixed education at all if they thus made themselves the arbiters of strife between different members of a community. It is true that a priest or a Presbyterian minister may have been unjustly suspended according to the rules of his own religious body, or that those rules may be, in the eyes of outsiders, unfair and oppressive. But the Board have, as they urge, no mission to inquire into this injustice, and have only to think how they can carry on their practical work; and for this practical work an adherence to the rule that the certificate of the proper ecclesiastical superior that a priest or clergyman or minister has been suspended must be taken as conclusive proof, and the Board can no longer deal with the suspended person on the footing which he occupied before the fact of his suspension was notified to them.

If the Board had on this occasion departed from their rule, and examined into the facts, they would, it is said, have discovered two things which ought to have prevented them from seeing in Mr. O'Keeffe's suspension a reason for summarily removing him from the managership. In the first place, they would have found out that he was suspended because he had brought an action in a court of law against a brother priest, which is contrary to the regulations of the Papacy, and that he was going to litigate in every possible form permitted by the law in order to get an opinion from lay judges that this was not a proper ground for suspending him. In the next place, they would have discovered that he had not been suspended by the proper authority—his own Bishop—but by Cardinal Cullen, who, as an archbishop, has only appellate, not primary jurisdiction, and who obtained special authority from Rome to deal with the case by virtue of a rescript the authority of which is, it is said, void in Ireland under a statute of Elizabeth. If they had discovered these points, what, unless they still persisted in removing Mr. O'Keeffe, could they have done? They could have taken one of two courses. They could have themselves pronounced judgment on one or both of the very difficult legal questions suggested by the facts elicited—the question whether an agreement not to sue in a court of law is legally binding on a priest, and the question whether the statute of Elizabeth is still in force, and, if so, whether its operation affected the validity of the suspension. It is this course that Dr. Ball, when speaking on Thursday, blamed the Board for not taking. He said that the Board should have allowed Mr. O'Keeffe to show that, though his Bishop certified that he had been suspended, yet he had not been suspended by his Bishop, but by a person who had no authority to suspend him except by virtue of a Papal rescript; and that the Board on hearing this should have perceived that the use of such a rescript touched the Royal supremacy, and have allowed it no force, and reinstated Mr. O'Keeffe in his managership. The duty of the Board was, accordingly, to decide a difficult legal question without argument, and to decide it in the sense which Dr. Ball thinks the right one. Or, secondly, the Board might have refused to make any legal decision itself, but might have taken cognisance of the intention of Mr. O'Keeffe to raise these points before the proper legal tribunals, and might have continued him in his managership until the courts of law had pronounced against him. If so, the rule of the Board ought to be that, if they receive a certificate of suspension, and the person suspended informs them that he intends to test in a court of law whether he has been properly suspended, they ought to treat him as not suspended, and to continue him as a duly qualified manager of schools until the House of Lords has pronounced him in the wrong, or until he has been brought to confess that he cannot afford to take his case to the House of Lords. This is to state the theory in an extreme shape, but it is useful sometimes to see what theories come to if they are pushed as far as they will go. Let us, however, admit that there is much to be said both for the Board adopting such a rule and against it. On the one hand, there is something, to say the least, uncomfortable in allowing a Board administering Parliamentary funds to prejudge the issue against a man who is combating what may be ecclesiastical tyranny, and to cut off his money until the law has pronounced for him. On the other hand, there is the great practical difficulty of carrying on mixed education if a Board treats as not suspended a person whom the heads of his religious community treat as suspended, and if they let this state of things go on as long as this person can find funds for litigation. Justice may be on the one side and expediency on the other; but even if the House of Commons, which, as it has to grant the money, may decide how it shall be spent, should decide that the Board ought to be governed by a new rule, there seems no occasion for censuring the Board for having in this case adhered to a different rule. The rule to which they adhered was one of long standing, it had hitherto been applied to Catholics and Protestants alike without complaint, and the Board honestly believed that it was a wise rule in itself and perfectly defensible, if due regard was had to the circumstances under which national education is carried on in Ireland.

RUSSIAN POLICY IN ASIA.

THE authorized commentary on a recent debate in the House of Commons which has been published in the Moscow and St. Petersburg papers amounts to an official repudiation of the understanding which was established three months ago between the English and Russian Governments. There was from the first reason to fear that the parties to the negotiation might hereafter attach different meanings to the terms of the agreement. Lord Clarendon's original project of a neutral zone had been abandoned in the course of the discussion; and it was finally settled that Russia should not interfere by influence or by force in the affairs of Afghanistan. A difficulty which had arisen in determining the frontiers of Afghanistan was removed by Prince Gortchakoff's courteous admission that the English Government had greater facilities than his own for acquiring accurate information on the geography and politics of the remote frontier districts; and he added that the Governor-General of Turkestan had abstained from sending officers of his own to ascertain the facts, because he wished neither to excite unfounded expectations among the natives nor to cause uneasiness to the Indian authorities. At the close of his despatch the Russian Chancellor expressed a confidence that the paramount influence of England over Afghanistan would be used to prevent the Ameer from committing any encroachments on his neighbours. Lord Granville may possibly have had good reasons for allowing the correspondence to close without any reply to Prince Gortchakoff's suggestion; but he cannot have failed to understand that the pith of the communication lay in the postscript, which involved two pregnant assumptions. Future Russian Ministers would be entitled to refer to the unanswered despatch as a proof both that England was responsible for the proceedings of the Afghan Government, and that the right of Russia to annex any territory beyond the stipulated limits was tacitly recognized. If the present Ameer or his successor had made an expedition beyond the frontier of Badakshan, the Russian Government would have preferred remonstrances in London; and, in default of satisfaction, it would have claimed the right to disregard the agreement of 1873, and to follow the Afghans, if it were deemed expedient, into their own territory. On the other hand, any English protest against annexations in Central Asia would have been answered by a reference to the terms of Prince Gortchakoff's despatch. Although it is scarcely probable that the further progress of Russian arms will depend on written undertakings, it is impossible to deny that the recent correspondence justifies the reputation of Russian statesmen for diplomatic adroitness. The neutrality of Lord Clarendon's zone was gradually changed into an English protectorate which implied a corresponding liability for the acts of a really independent potentate.

In answer to criticisms on the correspondence, Mr. GLADSTONE explained to the House of Commons that the supposed guarantee of the good conduct of the AMEER was entirely imaginary. Lord GRANVILLE's language was perfectly consistent with the authorized version of his meaning; but it was difficult to understand what consideration had, according to Mr. GLADSTONE's explanation, been given to Russia for any concession which might be thought to have been obtained. Foreign statesmen professed, and probably felt, a not wholly complimentary surprise when the present Lord DERBY explained away the Luxemburg guarantee into an obligation which could in no conceivable event become binding. A similar effect seems to have been produced by Mr. GLADSTONE's impetuous burst of caution; or, more probably, the Russian Government gladly found an excuse for breaking a compact which had already caused dissatisfaction to a powerful party in the country. From the time of the mission of Count SCHOUVALOFF, journals which are supposed to express the opinions of some of the Ministers had repeatedly announced that the EMPEROR had merely communicated to the English Government his present intentions, without binding himself by any engagement to a foreign Power. The distinct promise that Khiva should be evacuated as soon as the object of the expedition was accomplished was especially unpalatable to the advocates of the extension of the Empire; nor could it be denied that circumstances might perhaps render the fulfilment of the promise either impossible or highly inexpedient. It mattered little for the present whether the results of the negotiations had hampered the policy of Russia on the frontier of Afghanistan, but the more warlike party has obtained a victory in the rupture or disavowal of an engagement which must stand or fall as a whole. On the pretext that Mr. GLADSTONE has disclaimed on behalf of his Government all responsibility for the acts of the Ameer of CABUL, the organ of the Russian Foreign Office announces that the whole arrangement has become void; and consequently the Russian Government will henceforth claim for itself entire freedom of action in dealing with Khiva when the impending conquest is completed. The official writer affects entire satisfaction with the interpretation which has, according to his contention, been placed by the English Minister on the agreement or understanding. If the settlement effected by Lord GRANVILLE and Count SCHOUVALOFF had any value, it was perhaps indiscreet to sacrifice by an unnecessarily hasty repudiation of responsibility any advantage which had been obtained; but Mr. GLADSTONE has yet to learn that excessive timidity is sometimes equivalent to rashness. When questions are asked about the purport of a despatch or correspondence, judicious Ministers follow the example of lawyers by referring curious inquirers to the document itself. No bad consequences could have resulted from an evasion of the demand for explanation of an agreement which might easily have been described as perfectly free from ambiguity.

The best course which can be adopted is to accept in earnest the polite irony of the Russian official writer. There is little advantage in attempting to determine by previous agreements a policy which will inevitably be regulated by motives of interest or ambition. If Russia at any time desires to enter Afghanistan at the risk of provoking a collision with England, the experiment will be tried whether the SCHOUVALOFF engagement is regarded as valid or as void. A menacing movement in the direction of Herat or of Cabul would be a sufficient cause of war, although no obligation to abstain from aggression had been previously incurred. The correspondence, even if it were held to constitute a binding contract, provided no sufficient security against the dangers which are held on competent authority to be most formidable. While Lord GRANVILLE only asked for an understanding that Khiva should not be permanently annexed, and that the frontier of Afghanistan should not be crossed, Indian civilians and military officers agree that the course of a possible invasion would be through Persia, and not by way of the Afghan passes. Mr. EASTWICK censured the conduct of diplomatic intercourse with the Court of Teheran more severely than the alleged laxity of the Government in not interfering with the Russian conquests in Central Asia. Russian journalists have some excuse for their complaint that the tone of the debate in the House of Commons was suspicious and unfriendly. It is not to be expected that the sanguine theories of Mr. GRANT DUFF and Sir C. WINGFIELD should be accepted as a set-off against the warnings of Mr. EASTWICK. There is, in truth, a certain inconvenience in the public discussion of international relations. The popular clamour against secret diplomacy might be not less profitably directed against Parliamentary debates on delicate questions of policy. In the happy phrase first used by Mr. GLADSTONE, though it has been erroneously attributed to other statesmen, English politicians live in a glass house where all their operations are visible to the world. The unpleasant impression which is frequently produced by American candour renders intelligible the annoyance which is created in foreign countries by the plain speaking of English members of Parliament. In the present instance the effect of the late debate may be useful, although Mr. EASTWICK and Mr. GLADSTONE have between them succeeded in rendering Lord GRANVILLE's well-intended labours altogether abortive.

It is desirable that an ambitious Power should receive ample notice of the contingent resistance which may be provoked by aggression. It has been with perfect truth a hundred times repeated that the Crimean War was rendered possible by the deferential reticence of Lord ABERDEEN's Government. The Russians are not likely to be deterred by direct menace from the prosecution of their designs; but it is no discredit to the proudest Government to abstain from tempting a definite and unnecessary risk. If a rupture can be postponed for a few years, it is not improbable that it may be altogether averted. The absurd commercial theories which largely affect the policy of Russia are not destined to enjoy a long existence; and when it is found as easy to trade with neighbours as with subjects, it may be hoped that Emperors and Ministers will not make war for the childish pleasure of altering the colour of provinces and boundary lines on the map. The expansion of the Indian Empire has for several years been suspended; and probably it is finally closed. Russia, in turn, may hereafter learn to be satisfied with the undisputed possession of a large fraction of the whole surface of the earth.

M. THIERS AND THE RIGHT.

THE French Assembly will meet on Monday under the influence of a seemingly general impression that the majority are about to make a decisive effort to get the control of public affairs into their own hands. Impressions of this kind are not always justified by the result. The framers of Reports and the framers of Resolutions are not necessarily the same persons, and the intentions attributed to the Right may only be what a few ingenious and uninformed members of the party think ought to be their intentions. Still there is a greater stir among the extreme Conservatives than has yet been seen, and the [illegible] from their point of view is certainly serious [illegible] to cause them real alarm. An interval of four months is all that separates them from the departure of the German army, and upon the departure of the German army the Assembly will be compelled either to confess that its trust has been fully performed, or to charge itself with new trusts, the assumption of which may postpone dissolution for another year. The Right have probably made up their minds that anything would be better than the first of these alternatives. The elections of the 27th of April and the 11th of May leave no room for doubt as to the composition of a new Assembly, supposing one to be elected this autumn. The present majority would reappear as a very small minority; the present minority would reappear as a majority disposed, no doubt, to support M. THIERS, but only on the condition of his giving his policy a much more decided bias in the direction of the Left. It would be something gained, therefore, if a general election could be averted, even for a year; but unfortunately for the Right this remedy is only capable of an imperfect application. Sound Conservative principles do not make men immortal; and, essential as it is for a deputy of the Right to live when the seat he vacates is certain to be filled by a man of opposite opinions, deaths go on just the same. Before very long the character of the Assembly will be entirely changed—more changed, in fact, than it would have been if there had been a dissolution in the autumn of last year. At that time the reactionary tendencies of the Right had not been fully gauged, and many candidates who would now have no chance of re-election might then have satisfied their constituents. Now it is no longer doubtful what the Right would like to do if they had the power, and will perhaps try to do even without having the power. In the partial elections which must be held from time to time, they will take care to return candidates of whose devotion to the Republic there can be no question. Consequently the Right find themselves in a strait between a dissolution, which means speedy extinction, and the continuance of the present Assembly, which means gradual

extinction. Out of this dilemma there is only one way of escape. It is to hurry on the necessary constitutional legislation while the existing Assembly can be trusted to deal with such subjects. The obstacle to this policy is M. THIERS, and all the various designs attributed to the Right agree in this, that they are directed to M. THIERS's removal. The newest of these is a scheme for driving M. THIERS into resignation by an open assumption of executive power on the part of the Assembly. According to this rumour, Marshal MACMAHON is to be invested with the supreme command of all the forces of the State—an invasion of the PRESIDENT's rights which, it is calculated, would inevitably lead to his retirement. Marshal MACMAHON would then associate with himself M. BUFFET and some other member of the Right. Under the direction of this triumvirate the Assembly would pass a law to restrict the suffrage, thereby depriving the next election of its worst terrors, while the way towards a Restoration would be smoothed by the appointment of the Duke of AUMALE as President of the Republic. It must be admitted that, if Marshal MACMAHON can be trusted to fall in with this plan, it has some elements of ingenuity. It is founded no doubt on the belief that the army is thoroughly Conservative and will be ready, if Marshal MACMAHON gives the order, to suppress the resistance which the Republican party would certainly offer. This resistance the Right probably reckon would be headed by Paris and Lyons, and would therefore be likely to take the shape of a revival of the Commune. At all events, it would be easy to represent it as doing so, and thus to secure for it the detestation of the rural Conservatives. Any attempt to excite the electors against the action of the Assembly which might be made by the moderate Republicans would be discredited beforehand by the identification of its authors with the extreme Radicals.

It is difficult not to believe that the politicians who built up this pleasing castle in the air are reckoning without either their Marshal or their army. There have often been rumours of some intervention of Marshal MACMAHON in political affairs, but they have usually been promptly silenced by his appearance in attendance on the PRESIDENT. It is possible of course that he may now have satisfied himself that M. THIERS's rule is hostile to the interests of France, and that he is prepared to atone for having so long supported him by taking an active part in his deposition. Even in this case the assumption that the army will obey him seems very hasty. Marshal MACMAHON is a popular commander no doubt, but he is not the only popular commander, and the names with which the few creditable incidents of the late war are associated are rather those of General CHANZY and General FAIDHERBE. Both of these officers would certainly oppose to the utmost any attempt to emp[illegible]my in support of a Government which, whatever m[illegible]he technical legality attaching to it, would have no bet[illegible]title to power than a successful *coup d'état*. Some little colour is given to the notion that the army would be at the disposal of the Assembly in the event of its undertaking a crusade against the PRESIDENT, by the hesitation which occasionally marks the PRESIDENT's own policy. If he is not afraid of the Right—and, apart from the army, he has certainly no cause to be afraid of it—why does he do so much to conciliate it, or rather why does he omit to do that which would secure him the unreserved good will of the Left? M. THIERS is not a slave of forms, and his deference to the authority of the Assembly would not of itself account for his acquiescence in its usurpation of a sovereignty which, after the departure of the Germans, will no longer belong to it except in name. A representative Chamber which arrogates to itself the supreme control of public affairs, while it refuses to give its constituents an opportunity of pronouncing whether it still represents them, is a contradiction in terms. The Assembly claims to govern France because it represents France, and its refusal to put its claim to the test of a general election is tantamount to an acknowledgment that it has ceased to represent France. There is no need for M. THIERS to dissolve it by force. All that he would have to do, in order to retain the undivided support of the Republican party, would be to proclaim that the country has always looked forward to the liberation of the territory as the term of the Assembly's existence, and that, as the present will no doubt be the last year of its labours, it is not expedient to bring in any constitutional measures except such as relate to the constitution of the executive power during the interval between one Assembly and another. It is true that a declaration of this kind might drive the Right to despair, but then what could even their despair effect against a President supported by the country and by the army? If M. THIERS is not sure about either of these, his conduct is intelligible enough. A monarchical reaction imposed upon the country by military force would as inevitably usher in civil war as a second Communist insurrection. Yet to defy this reaction would not serve M. THIERS's purpose, unless he were sustained in his resolution by that great body of neutral opinion which he has hitherto carried along with him. There is no reason to fear that this middle party will go over to the Right, but there is reason to fear that the recent elections at Paris and Lyons may have thrown it back into that inert and indifferent attitude which does perhaps more real harm to the country than active help given to the wrong side. If the monarchical party could command the support of the rural Conservatives, they would at least be in a position to ensure France a strong Government; if neither the Right nor the Government can command it, there is no present hope of escape from that violent oscillation between extremes which has been her political condition for so many years. The Message which M. THIERS will probably address to the Assembly within a day or two, or the speech by which his Message will be followed, may supply more certain indications as to the extent to which the PRESIDENT is influenced by either of the apprehensions which can alone account for any further hesitation in his policy.

MR. MILL.

THE interesting biographical notices of Mr. MILL which have appeared since his death confirm the general impression of his extraordinary abilities and attainments. Believers either in the hereditary transmission of intellectual faculties, or in the paramount efficacy of education, may alike find in Mr. MILL a proof or illustration of the soundness of their respective doctrines. The son of a laborious student, who was also an independent, if not an original, thinker, he was trained with elaborate consistency for the career in which he followed and excelled his father. The education of PITT by Lord CHATHAM for Parliamentary and official life affords a similar instance of the successful adaptation of natural gifts to a purpose deliberately chosen. In both cases the end would perhaps have been more satisfactorily attained if a wider scope had been left to circumstances and inclination. As PITT was born an orator, MILL would in any case have been an accomplished scholar, with a strong bias to moral and political speculation. The artificial training which would have converted an ordinary pupil into a narrow pedant accounts for the defects which seem to all but the most devoted admirers to have impaired the completeness of MILL's powerful and versatile intellect. It may be collected from the records of his early life that he never was a boy; and it may be confidently asserted that no cultivation which can be derived from parents or teachers supplies the want of early intercourse with equals. The republican atmosphere of school is more peculiarly indispensable to studious and thoughtful minds. If MILL had been turned early into a playground instead of preparing lessons for his father and corresponding with BENTHAM, he would have acquired unconsciously a kind of knowledge which he never afterwards learned from books or from solitary meditation. The opinions of a recluse on practical matters are rarely to be trusted; and through life Mr. MILL held himself apart from society. No man less deserved to be classed among BURKE's cold-blooded metaphysicians, for he had even an excessive tendency to be guided by sentiment and impulse; but BURKE's epithet was inaccurate as it was applied to the literary precursors of the French Revolution, and he would probably in the heat of controversy have included MILL in the same category with CONDORCET. Political metaphysicians or innovators, though they are not necessarily cold-blooded, are often deficient in the instinctive sympathy with human nature which is only to be learnt by early and unbroken familiarity with the living world. Enthusiasts for equality and fraternity who carefully shut their doors upon their supposed equals and their nominal brethren find it comparatively easy to preserve the gloss on their creed.

Mr. MILL's indirect influence on political and economic thought and practice has been greater than that of any of his contemporaries. Some of his most vigorous critics have been trained in his school, and nearly all the active and ambitious minds of the younger generation may be found among his professed disciples. The literary and philosophic merits or defects of his writings will long remain matter of controversy. His opponents contend that his logic is not purely scientific, that his political economy is tainted with socialism, and that he had not that subtle perception of metaphysical refinements which is almost as distinctive a faculty as an accurate musical ear. Whatever may be the final result of the discussion, it would be absurd to dispute his claim to the rank of a great intellectual leader. The adversaries and the victims of

VOLTAIRE proved to their own satisfaction that he was a second-rate poet, a superficial historian, and a mere smatterer in science; but it was nevertheless true that he enjoyed undisputed literary supremacy, and that he moulded the character of a nation. Mr. MILL, who was of a far more earnest and serious nature, if not the equal of VOLTAIRE in genius, has in a narrower sphere produced similar results. The greatness of a prophet or heresiarch is tested not so much by the language or substance of his doctrines as by the number and quality of the sect which he has founded. In his disregard for prejudice and tradition Mr. MILL generally inclined to revolutionary or extreme opinions; but fortunately he had the opportunity of acquiring large experience in one kind of practical business. As Mr. DISRAELI has acutely remarked, almost all men are conservative in their own special departments; and Mr. MILL, who had during a great part of his life been conversant with the details of Indian administration, steadily and powerfully opposed the transfer of the Government from the Company to the Crown. The evils which he anticipated from the change have happily not occurred, but the cautious prudence which attends special and minute knowledge contrasts strongly with Mr. MILL's ordinary impatience of theoretic anomalies. It is probable that his employment in the India Office saved him from being a bookworm, and checked his propensity to become an impracticable dreamer. On the other hand, it is not surprising that his acquaintance with Eastern systems of tenure induced him to favour a dangerous disturbance of English property in land.

Mr. MILL's numerous adherents and admirers naturally welcomed his late entrance into Parliamentary life; but his failure at his second election caused but little regret. His accuracy of reasoning and of expression, and his great literary reputation, commanded respectful attention in the House of Commons; and he was lucky in an early opportunity of exposing some economic fallacies into which landowners and farmers had excusably lapsed during the panic caused by the cattle plague. It soon appeared that Mr. MILL was not only a logical reasoner, but on certain subjects an obstinate fanatic. The serene philosopher, like his prototypes in the French Revolution, was sometimes ready to apologize for the excesses of the mob, though he was incapable of waiving his own convictions in deference to popular clamour. To the last Mr. MILL was an opponent of the Ballot; and he was one of the most zealous advocates of the representation of minorities. His disinterested sincerity was universally acknowledged, but the soundness of his judgment commanded less and less confidence as he took a more active part in political contests. The writer who had most extravagantly asserted the liberty of opinion was himself, on some occasions, the most intolerant of men. He broke off relations with early friends because they refused to concur in his passionate detestation of negro slavery; and he could never be persuaded that any other issue was involved in the American Civil War. He denounced the English supporters of the Confederate cause as promoters of slavery, although not one of their number would have admitted that his choice of a side was determined by any feeling of good will to the obnoxious institution. Mr. MILL's profound belief in the intellectual and political equality of the sexes was a delusion which would alone have diminished the confidence which might have been reposed in his authority. There was in truth something feminine in his own mental constitution which disturbed the calm balance of his judgment. As might have been expected from his nature and education, he was remarkably incapable of estimating the capacity and character of men. During his short occupation of a seat in the House of Commons he wantonly offended his party by recommending to a constituency a favourite nominee of his own, in terms of exaggerated eulogy, as a substitute for a veteran Liberal member. His selection happened to be not only injudicious but ridiculous; and his interference was universally regarded as officious and offensive.

The most serious blot on Mr. MILL's political reputation is the support which he gave to the subversive schemes of socialist agitators. While nearly all his other opinions were the result of his own study and reflection, he inherited from his father his mischievous crotchet of the inalienable title of the community to the land. For the existing rights of ownership he would have awarded full compensation; but he had persuaded himself that the gradual rise of value, or, as he called it, the unearned increment, ought to be appropriated by the State. If he had confined himself to oral or literary controversy on the subject he would have incurred no moral blame; but, in his eagerness to realize his aspiration, he allied himself with the revolutionary Clubs which, as he ought to have known, were bent on simple rapine and spoliation. Dissatisfied artisans and political malcontents at once recognized the difference between their new patron and the vulgar demagogues who had blindly appealed to selfish instincts. It was in the highest degree encouraging to find that the austere philosopher who scorned to humour the demand for secret voting could, by some mysterious process of reasoning, arrive at the same conclusion which had by a simpler process commended itself to the unsophisticated appetites of human nature. Mr. MILL was in want of a motive power which he hoped to find in the force of the multitude; and the Land and Labour League appreciated the advantage of having its own crude violence and cupidity translated into plausible propositions of a scientific form. The less enlightened members of the unnatural partnership are comparatively exempt from blame. The BRADLAUGHS and the ODGERS justly felt that Mr. MILL was promoting their objects, while they were only colourably or provisionally concurring with Mr. MILL. If their united efforts had succeeded, the triumphant reformers would have made no distinction between the property which represented remote or recent earnings and Mr. MILL's unearned increment. Some of his more judicious friends probably regret that his last public act was his appearance at a meeting at Exeter Hall, when he described the difference between himself and the promoters of universal plunder as merely a matter of detail. His example will tend to confirm the common belief that there is an intrinsic antagonism between theoretical and practical ability. A most successful, though not the soundest, teacher of the age, he failed in public life; but nevertheless the functions of thinking and acting will be found compatible whenever they are controlled by that inestimable faculty of wisdom which was wanting in Mr. MILL's mental and moral constitution.

THE LORD CHANCELLOR'S LAND BILL.

BY the general concurrence of competent opinion, the present system of land transfer has long been pronounced to be faulty and mischievous. It is costly, cumbrous, and troublesome, and, so far from tending to make property secure, it establishes a sort of chronic condition of doubt and insecurity. It has been condemned in the strongest way by successive Royal Commissions, and for many years past almost every Lord Chancellor has attempted, with more or less success, to legislate upon the subject. When we find men like Lord ST. LEONARDS, Lord WESTBURY, Lord CAIRNS, Lord HATHERLEY, and Lord SELBORNE all agreeing that the present state of the law is scandalous and indefensible, it may be regarded as a pretty safe conclusion that it really is so. As the law stands, an owner can hardly ever be sure that he has a perfectly good title to his land. If he can show a good title going back for sixty years he may go to bed with a quiet mind. The Court of Chancery will compel a purchaser to accept a title of this character, whether he likes it or not; but then, as Lord SELBORNE observed, a sixty years' title is a thing which almost everybody who sells land guards against being obliged to prove, and almost everybody who buys land is content to take a good deal less. Yet with less than sixty years' title nobody is quite safe, unless indeed there has been twenty years' clear possession. Every time the land comes into the market there must be a fresh investigation; the lawyers must go through everything again from the beginning, and, no matter how competent all the former sets of lawyers through whose hands the papers passed may have been, their confirmation of the title is regarded as worthless until it has gone through the hands of yet another set of lawyers, and has been the subject of another searching inquiry, and another long bill of costs. That Englishmen should down to this hour have submitted to such a system as this is rather an illustration of their patience than of their common sense. Landowners individually have suffered from it because the chronic uncertainty of title and recurring expense of investigations undoubtedly diminish the value of their property; and, on the other hand, the country has suffered because it has checked the natural freedom of commerce in regard to an important element of national wealth.

From time to time attempts have been made to simplify and facilitate the transfer of land. There have been Acts for shorter conveyances, and for the registration of titles, but for one reason or another these Acts have had very little practical effect. Conveyances are still about as long as they always have been, and very few owners have come forward to register

their titles. The common explanation of this is, that "it is "all the lawyers." It is assumed that they fatten on a cumbrous, costly, and uncertain system which places owners helplessly in their hands, and that they resist with all the influence of a powerful class every attempt to subvert their tyranny and to bring land within the ordinary conditions of merchandize. This explanation is perhaps partly true, but it is certainly not the whole truth. The Commissioners of 1868 were satisfied from the evidence they took that, as a rule, lawyers were shy of registration, not so much because they were afraid for their profits, as because they doubted whether it would really be safe and advantageous for their clients. Setting aside the professional interest in long papers and big fees, there is a sufficiently obvious explanation of the failure of Lord WESTBURY'S registration office. In order to get a title upon the register, an owner has to show that it is good enough to please the Court of Chancery—that is to say, good for sixty years back; and there are also other stringent and irksome conditions which have to be fulfilled. A very little reflection will show that the real difficulties of land transfer are due in a great measure to the nature of the property itself. In an old country like England, where land has passed from one family to another, and all sorts of obligations and interests are constantly growing up in connexion with it, it is necessarily difficult to say exactly what an owner's rights amount to when he has not the fee-simple absolutely to himself. In point of fact, a great deal of the land in the country may be said to be held by little knots of persons in conjunction, and the nominal owner is only one shareholder among many. The analogy between shares in a public company and the varied interests which exist in connexion with land is obviously imperfect; a share in a company is a specific and distinctly defined part of the whole property, whereas an interest in land is often of a contingent character, and cannot be sharply measured off in this way. Lord SELBORNE pointed out very truly that the reason why the transfer of land can be managed so easily in Australia is simply that there all titles date only, as it were, from the day before yesterday and not from generations back. It is impossible not to envy the ease and facility with which the Australians manage these transactions, but it would obviously be idle and unreasonable to legislate for England as if it were a fresh young colony just beginning life, and with no old records to bother it. It is certainly very awkward that in England the possession of land should be split up into such a great variety of interests; but, as the interests exist, they must be taken into account in analysing the ownership of property. The intricacy and confusion which now prevail are mainly due to the habits of the people, and though an alteration of the law might do a great deal to bring things into a new groove, and to simplify the system, any attempt to introduce violent and sweeping changes would be equally mischievous and impracticable. All that can be done is to help owners to shake themselves clear of old complications, and to place new transactions on such a footing as to prevent any further accumulation of perplexities and embarrassments.

It seems to us the great merit of Lord SELBORNE'S measure—for though there are two Bills they may be considered as parts of one measure—that he has seen the advantage of bringing over people to the new system rather by coaxing than by compulsion. The registration introduced by Lord WESTBURY is purely voluntary. Nobody need register unless he likes, and unfortunately it was omitted to offer any inducement to take this step. Only a sixty years' title, such as the Court of Chancery would compel a purchaser to accept, will be placed on the register; but there are not very many titles which can be carried so far back satisfactorily, and owners who possess such very excellent titles are apt to think that, with the Court of Chancery behind them, there is no need to trouble themselves about any further securities. All other classes of owners are excluded from registration; and the Commissioners of 1857 proved by anticipation that, on this ground alone, Lord WESTBURY'S Act would almost certainly break down. A judicial or quasi-judicial examination of title narrows the benefits of registration. The expense of the investigation shuts out small properties; and the trouble, expense, and fear of an adverse decision repel others. To submit a title to a scrutiny of this kind is to run the risk of waking all sorts of sleeping dogs, as well as putting on the scent more wakeful hounds. The number of covetous and ignorant men who fancy they have claims to other people's property, founded on vague tradition, or perhaps on nothing better than similarity of name, or, it may be, originating only in a highly imaginative cupidity, is almost incredible, and the manufacture of evidence in support of such claims is a common form of fraudulent ingenuity. Under these circumstances it is hardly surprising that English landowners should be especially alive to the unprofitableness of stirring up quiet things.

Lord SELBORNE has expanded Lord WESTBURY'S system, and softened down its hard conditions. There is to be registration for all owners who choose to ask for it. If an owner can show what is technically known as a "good holding title," according to which possession has been held for not less than twenty years under a conveyance for value made not less than twenty years back by some person claiming to be entitled to dispose of the fee-simple of the land, his title will be certified as absolute. If a title is not good enough to fall within this category, it may be certified as limited—that is to say, as good from the date of some conveyance for valuable consideration specified in the register; or a title may be registered, without being certified at all, just for what it is worth. The advantages of this plan to landowners are considerable. An owner who applies for an indefeasible title will find that he can obtain it on much less onerous terms than under the present law. It is not usually very difficult to prove a safe holding title, and when this has been proved and registered, the ease and economy of transfer will add to the value of the property. Registration with a limited certificate will also to some extent diminish the trouble and expense of transfer; while those who register without a certified title will at least gain the advantage of having time run in their favour from that date. And this advantage will be increased by Lord SELBORNE'S second Bill, substituting ten instead of twenty years as the period within which suits may be brought for the recovery of land or rent. A title which was registered without investigation or certificate would, if not attacked within ten years, be entitled to be made absolute. Before registration is granted, notice must be sent to all persons having claims upon the land, and the registrar may require the description of the land to be verified on oath by the applicant or by persons having full means of information. The applicant and his attorney must also take oath that they have made known to the registrar all deeds relating to the title of the lands, and all facts material to the title, and all charges, liens, incumbrances, &c., affecting the property, to the full extent of their respective knowledge and belief. Why the registrar should be authorised to dispense with such affidavit, if he chooses, we must say we fail to see, but that is the finish of the clause. As a further protection to persons interested in the land, they will be allowed to lodge a caveat with the registrar, claiming to be entitled to notice of any application that may be made for registration, and after such caveat has been lodged no registration of the land in question shall be made without due notice to the cautioner. In the case of applications for a certified title, the registrar may cause notice of the application to be given by advertisement, and after he has approved the title, his intention to register it must be notified by public advertisements and also by placards posted on the land, and by notices served on persons interested in the matter; and three months must then elapse, during which cause may be shown against the title, before it is finally registered.

When any land is registered, the record of the title is to be entered in a book called "The Land Register," with all the particulars concerning it, and the owner will then be entitled to receive a "land certificate," or transcript of the record, which shall be *primâ facie* evidence of the matters contained therein. If a charge is made on any land the charge will be entered on the Register, and the person in whose favour the charge is made can have a certificate of it; when the charge is satisfied, it will be written off. When land is transferred, the transferor must deliver up his "land certificate" to the registrar, who will cancel it, and issue a new certificate to the transferee. If only a part of an estate is sold, the transferor will receive a fresh certificate for the land he retains. The Register is to be open to inspection by any one who can show that he has an interest in an estate. For two years the registration of all titles will be purely voluntary, and it will continue to be voluntary except when land is sold. At the end of two years, if the fee-simple of any land is sold, the land must then come on the Register; and there will no doubt be some opposition to this proposal. It may appear at first sight that neither the seller who has found a purchaser, nor the purchaser who is satisfied with the title, has any reason to object to registration; but a man who might be willing to buy a faulty or doubtful title which he could keep out of sight would not be so ready to buy a title which he would have to publish to all the world. One of the most important parts of the Bill is that

relating to the judicial sale of land after the fashion of the Encumbered Estates Court; but this is rather an excrescence than a natural element of the scheme, and it would seem to be only prudent to postpone the experiment until it has been seen what sort of tribunal is to be entrusted with such large and serious powers.

REPUBLICANISM AT BIRMINGHAM.

IF Mr. BRADLAUGH'S advice to the Republican delegates who met at Birmingham last Sunday is honestly taken, future revolutions will be deprived of all their terrors. The object of the convention was to overthrow the English Monarchy and to set up a Republic in its stead, but Mr. BRADLAUGH was careful to explain that this object must be attained by strictly legal means. Queen VICTORIA is not to be hurled from her throne; she will not be expected even to abdicate until the Bill which puts the Crown into commission has received the Royal Assent. Mr. BRADLAUGH evidently lives in the distant future, for in his imagination a Republic means a Government which has its origin in the political education of the masses. As soon as the majority understand that they have political duties to perform as well as civil rights to enjoy, the constitutional transition will be effected as a matter of course. Every man will be so bent upon serving the State, that some expedient will have to be devised by which an opportunity of serving it will be found for every man. It will be admitted on all hands that Englishmen are still very far from being educated up to this point. Perhaps the nearest approach to Mr. BRADLAUGH'S model citizen is the young man who is cramming for a Civil Service Examination. He certainly wishes to serve the State, though his desire has not yet been found to involve any decided opinion on the comparative merits of Monarchy and Republicanism. The universal discharge of political duties is already exemplified in the jury system, but the victims of the sheriff's summons are generally in a frame of mind which would lead them to welcome a despotism, if it would exempt them from the obligation of aiding in the administration of justice. In some Continental countries the masses have been ready to undertake political duties, but their reading of their mission has usually involved the taking off of their neighbours' heads or the seizure of their neighbours' property. Neither of these processes is to find a place in Mr. BRADLAUGH'S visionary Republic until such time as it is authorised by statute. Arbitrary executions and arbitrary confiscations do not change their character by obtaining Parliamentary recognition, but it is something to know that Mr. BRADLAUGH intends to make sure of his majority before determining how to use it.

The older revolutionists have commonly defended an early recourse to violent measures on the plea that without them there is no getting the momentum necessary for the overthrow of established governments. Mr. BRADLAUGH claims to have discovered unsuspected virtues in rose-water as a revolutionary agent. It may be doubted, however, whether he has not underrated the difficulty of keeping his followers in training on so unsubstantial a diet. He summons them to an attack upon the English Monarchy, but he forbids them to use any means for their purpose except such as are allowed by law. The law forbids them to combine secretly, therefore there must be no secret combination. The law forbids them to use physical force, therefore the man who advocates physical force is either a traitor or a madman. The law will punish them for not protesting against seditious language uttered in their presence, therefore if any man says anything illegal at a Republican meeting, his hearers are at once to interrupt him with a formal statement that they do not share his sentiments. No sucking dove could put forth a milder programme than this; but it is open to the objection that the life of the Republican who carries it out will be harassed by innumerable scruples. What constitutes secret combination? Mr. BRADLAUGH says that where twelve men combine secretly, one will always be found to betray the rest. But what is a timid Republican to do who finds himself in a room with eleven others of the same way of thinking? Is he to call in the landlord or the policeman, and take him to witness that they are not combining secretly, or is he to insist, regardless of climate, that the meeting shall at once adjourn to Hyde Park or Trafalgar Square? If Mr. BRADLAUGH'S advice as to interrupting Republican speakers is strictly followed, there are likely to be more interruptions than speeches. Persons who cultivate the art of detecting illegal language are sure in time to become proficients in it, and many sentiments which would now be suffered to pass unchallenged may hereafter supply matter for repudiation. Mr. BRADLAUGH may be right when he says that, though there is only one step between the aim of the National Republican League and treason, that step is so clear that there is no danger of its being taken. But is he sure that under these circumstances any step at all will be taken? We are disposed to think that Republicans whose cardinal principles of action are the avoidance of secret combination and the repudiation of illegal language are likely to arrive at a profound conviction that their real strength is to sit still.

The truth is, that neither of the two main sources of Republican enthusiasm is very abundant in England. In France Republicanism is a passion which in its disregard of consequences passes the love of women. There are many Frenchmen who would rather be miserable under the worst of Republics than happy under the best of Monarchies. This is not a sentiment with which Englishmen have as a rule any sympathy. They are willing to get rid of institutions which have been proved to be mischievous, just as they might be ready to wear a wig if they were bald, though they are not willing to shave their heads because they think that they would look better if their hair were darker or lighter. It is to Englishmen of this type that Mr. BRIGHT has addressed the letter which was read at the Birmingham Convention. Forty years of continuous improvement in laws and administration have convinced him that it is in the power of Englishmen to make their Government thoroughly good without bringing upon their country the "troubles which are inseparable from "the uprooting of an ancient Monarchy." Of course this kind of teaching will not satisfy those to whom the form of government is as important as the substance. But it is likely to make more impression on those who only value the form for the sake of the substance than Mr. BRADLAUGH'S exhortations to overthrow the Monarchy by Parliamentary action. The National Republican League comes into existence with a pretentious list of reforms which it wishes to see effected, and it recommends its members to aim at founding a Republic as the surest means of accomplishing them. If Mr. BRADLAUGH proposed to obtain his Republic by action outside Parliament, this procedure would not from his own point of view be open to question. It is highly probable that a Parliament elected after a revolution would be more likely to establish universal suffrage, to give England, Scotland, Ireland, and India local Parliaments, to disregard supposed rights of private ownership in land, to abolish the House of Lords, and to do away with standing armies, than any Parliament which will be elected without a revolution. But Mr. BRADLAUGH proposes to obtain his Republic by the same means as those to which he looks to obtain all the other blessings already enumerated; and those of his supporters who value the Republic chiefly as a necessary preliminary to the attainment of this social millennium may be tempted to ask whether it would not be as easy to get the fruits of the Republic from a Monarchical Parliament as to get the Republic itself from a Monarchical Parliament. No doubt if Mr. BRIGHT'S description of the last forty years were inaccurate, if there had not been a steady course of improvement in laws and administration during that time, if the existence of the Monarchy were associated in the reason, or even in the fancy, of the people with a single unredressed grievance, if the troubles inseparable from the uprooting of an ancient Monarchy could be represented as the price which must be paid for the destruction of the abuses inseparable from the maintenance of an ancient Monarchy, the working classes would not reason in this way. They would be under the influence of the second cause of Republican enthusiasm—a sense of wrongs endured for which other forms of government provide no redress. But such a sense of wrong is impossible when, as Mr. BRADLAUGH admits, all that is necessary to the establishment of a Republic is that an Act of Parliament should be passed to establish it. The National Republican League is based on the declaration that in England all that a minority needs in order to get whatever it desires is the ability to convince their fellow-citizens that what it desires is expedient. A country of which this can be truly said has already secured all that is really valuable in Republican government.

EXTRAVAGANCE.

LORD DERBY the other day made some characteristically sensible remarks upon the importance of thrifty habits for all, but especially for the working classes. Speaking on so well-worn a topic, he could of course say nothing very new; but he suggested one or two curious problems. Englishmen, as he remarked, are distinguished amongst all the races of the earth by their extravagance, or are surpassed by their American cousins alone. He quoted some very pithy remarks of Defoe, who said

nearly the same thing more than a century and a half ago. Then as now, an Englishman could scarcely scramble through life upon an income which would enable a Dutchman to grow rich; and then as now it was the pleasant habit of a large number of our fellow-countrymen to fill their pockets with money and then to drink till the golden tide had ebbed. Lord Derby explained this phenomenon, or declined to explain it, by appealing to the permanence of national character. It is always a puzzling question how far national characteristics are inherited and how far they are merely the result of the permanence of certain conditions. Of course it saves a great deal of trouble to say that Englishmen waste their means because, as Dr. Watts put it, "it is their nature to"; and by that simple device to avoid all investigation of the political and social conditions by which the habit may have been fostered. There is indeed no reason to doubt that Frenchmen may inherit a tendency to hoard money as a dog inherits a tendency to bury bones; but, on the other hand, that inheritance is itself the result of the conditions under which previous generations of Frenchmen have lived; and by altering their circumstances we need not despair of producing an English breed with the same peculiarities. The labours of successive generations have developed special instincts in various breeds of domestic animals; and the saving instinct may be strengthened in the races which are at present most wasteful. Indeed it is probable that Englishmen are not so far from possessing this cardinal virtue of the political economists as we sometimes persuade ourselves. The Lowland Scot belongs to the same race with ourselves; and yet he is not generally considered to err on the side of extravagance. Some of the facts mentioned by Lord Derby prove upon what slight differences of position a great difference in the habitual conduct of life may depend. He was speaking on behalf of a very praiseworthy Society whose object it is to make known to the working classes the advantages offered by the Post Office Saving Banks. The fact that such institutions are at everybody's door must be pretty generally known; but the machinery has never been set in motion to an adequate degree. There is a helpless sluggishness in the human mind which prevents us from stooping to pick up a penny, though we are willing enough to hold out our hand. It has been found in certain Friendly Societies that the depositors prefer paying a shilling to a collector who calls at their houses rather than walk across a street to pay ninepence at the office. The principle is one with which we are familiar enough in everyday life. A man who has given an order to his bankers will cheerfully subscribe to a club for years; when, if he had to draw a cheque or to pay the money in hard cash, his zeal would have broken down after the first payment. The introduction of a single link completes the electric circle; and the removal of a trifling obstacle sets in action a whole set of forces which would otherwise remain in a state of complete inertness. The mere difference between declaring a regulation to be valid unless it is vetoed and declaring it to be valid as soon as it is approved seems often to be imperceptible; and yet in practice it often determines whether a law shall be dead or alive. This simple principle lies at the bottom of the theory of frugality, and suggests how small a change may sometimes be necessary to convert a wasteful into a saving people. On which side is the burden of proof? The claims of the public-house and the savings banks may be pretty equally balanced, and a slight difference in accessibility will make the whole difference in their popularity. The theory of advertising rests on the same principle. If the name of Smith occurs to the minds of a hundred people with ever so little greater facility than the name of Brown, that infinitesimal saving of trouble will determine them to go to Smith's shop. To make people do anything, you must save them the trouble of thinking. Mental exertion is the one thing to which nearly everybody has an ineradicable antipathy; and therefore, if you can make an ally of intellectual indolence, there is nothing which you may not hope to accomplish.

From another point of view, unluckily, this is the great obstacle in the way of preaching thrift. We are extravagant because we find it is so easy to act like our neighbours. The tendency is generally denounced as a proof of the moral slavishness of mankind. People complain, and with some apparent justice, of the tyranny of custom. An English curate has often a smaller income than an artisan or a coalminer; and yet custom orders him to wear a black hat and a frock-coat, to have a steady supply of white neckcloths, and to live up to a certain standard of external decency. Custom orders the struggling middle classes to give elaborately bad dinners, to live in separate houses instead of taking modest apartments, to send their children to schools whose only recommendation is in the high scale of charges, and generally to spend their income according to an arbitrary code of rules prescribed by the vague entity called society, instead of suiting their mode of life to their real wants. Moralists and novelists delight in expatiating upon the manifold evils which result, and they have of course no difficulty in showing that nine-tenths of the customary rules have very little to say for themselves in the court of pure reason. They infer that all the foolish extravagance of English life is due to the inherent snobbishness of our nature. The merchant apes the noble, and the shopkeeper apes the merchant; and the first notion of the poor man who has made a few shillings is to dress himself in the costume of the class just above him. We fully agree that the standard rate of living has been pitched too high in most ranks of society; and it is probable enough that that desire to imitate our betters of which snobbishness is the uglier side has been at the bottom of it. An English household, as compared with a household of the corresponding class in most Continental countries, is a model school in the art of throwing away money for an inadequate return. But when reformers propose a change, they have to deal not only with the spirit of snobbishness, but with the more powerful, if less offensive, spirit of general indolence. They invite us to break our chains; to plan a rational mode of living, and to carry it out in defiance of other people's opinions. Give up, they say, all the useless apparatus with which an English family surrounds itself, and be simple and independent. The doctrine is so excellent that we only wish it were easier to act on it; but these eager persons underrate the difficulty of putting it in practice. A certain social machinery is provided, costly and extravagant it may be, but yet with the surpassing merit that it is there. To provide the more reasonable machinery would require an amount of thought and trouble which nearly everybody dreads far more than the expense. You would prefer your children to go to schools where they would be taught something besides cricket, and would pay fees on a German scale of economy; then you must become an educational reformer yourself, and convert parents enough to start your new system. You wish for a house built on more rational principles; you must be your own architect, or, in other words, run a risk of going to a lunatic asylum. You wish to entertain your friends on more economical principles. The chances are that you save a very few pounds, and make your home unbearable. Simple meals are perhaps better than bad imitations of elaborate cookery; but unluckily simplicity both in food and dress is very apt to mean expense. You wish to improve your relations to your servants, and you discover that they prefer the conventional system, and that you have only made them more idle and discontented than before. Reformers in all these matters deserve every praise, and we earnestly desire their success; but reform in domestic economy, as in everything else, requires an amount of time, thought, and energy to which very few people are equal.

The real objection to living simply and cheaply is that one cannot afford it. A few geniuses can strike out new plans of life, but most men will find that more trouble is saved by falling in with the stream than by struggling against it. The more favourite method of economy, especially with the female mind, is that which is generally known as cheeseparing. Without descending to a lower platform, it is possible to effect something by minute attention to details. Money may of course be saved by substituting an omnibus for a cab, by retiring to the cheaper places in a theatre, and by all that painful system of minute attention which is irritating until it becomes a habit. Here, too, one must ask whether the game is worth the candle. To keep out of debt is not only the first of duties, but the most essential condition of happiness, and therefore no sacrifice which makes both ends meet should be grudged. But, though a person who pushes his economy to any further point may boast of setting a good example, he will scarcely find that he has consulted his own happiness. The strength of character which enables a man to retire to a hermitage and devote himself to intellectual studies on bread and water will bring its own reward; but the man who tries to divide his allegiance, to remain in the world without paying the world's price for it, will generally have little reward beyond the trifling satisfaction of a good conscience. In one sense it may almost be said that saving comes easier to the poor man than to his richer neighbour. If an appreciable fraction of your income goes in drink, you can save what is to you a considerable sum by improving in sobriety. The advantage, at least, is tangible, if the temptation to be surmounted is great. But the rich man who has succeeded by the exertion of much thought in putting his establishment on a more reasonable scale often finds that the advantage is rather shadowy and affects posterity more than himself. The chains with which we are bound are riveted upon us with terrible strength. Our bondage cannot be broken by a single good resolution, or a mere change of personal habits. Our families, our relatives, and our acquaintances combine to force us into the regular grooves. And undoubtedly many men who could do better things are forced to miserable hackwork for daily subsistence, and tempted to grow daily more commonplace, and plod more contentedly along the mill-horse round of existence. We would gladly welcome a deliverer, though we can see few signs of his appearance. Society grows more luxurious; and even our good qualities rather tend to increased energy in growing rich than to increased judgment in using wealth.

THE EARLY DAYS OF THE VIENNA EXHIBITION.

If the Vienna Exhibition continues to make fair progress, there seems a reasonable prospect of the arrangements being perfect by the closing day. Speaking seriously, it is most unfortunate from every point of view that everything should be so terribly behindhand. The execution is toiling slowly after the splendid conception, and can at the best only overtake it after those first impressions have been made which go for so much. If you set yourself laboriously to examine into things, you begin directly to appreciate all that they are meant to be. Only give the designers time, and their designs will doubtless realise themselves, although it is too probable that financially the lost ground will never be regained. But in the meantime the casual visitor finds himself utterly abroad in the general confusion. Even if he keeps himself to the great central buildings, as he naturally does, he only distinguishes vaguely the broad outlines which time is to fill in. And it is not merely that he passes blank spaces, or strays into empty cases, but

at every turn he is stopped by the stereotyped "verbotener Eingang," and requested by the civil Austrian police to keep moving along by the main thoroughfares. Three-fourths of the exhibitors, of all nations, are either sitting despondently with folded arms, waiting for precious boxes which it is impossible to trace, or else they are anxiously superintending the unpacking of cases that have just arrived, in the middle of the jostling crowd. Out of doors things are far worse. What ought to be thoroughfares for crowds of visitors are blocked by long trains of goods waiting their turn for delivery. Ponderous articles that are beyond injury from exposure to the execrable weather are left where they lie, till there shall be leisure to remove them to their places. There are monster cannon in steel and iron, and peals of bells in bronze, and trucks laden with blocks of coal and anthracite, and covered vans filled with statuary. The varied specimens of national architecture, from Turkish mosques to Swedish cottages, are only in course of erection or decoration. Gangs of workpeople have made themselves masters of the place, and, if they are working steadily, they are certainly working slowly. It might have been supposed that the grand Rotunda, the scene of the opening ceremony, would at least have been tolerably advanced. But the central Rotunda is by far the most backward part of the building. The temporary preparations for the opening day have been cleared away, and everything is beginning afresh. Crossing the Rotunda by what will be the grand thoroughfare of the Exhibition, it is barely possible to thread your way through the jumble of cases and the stands in course of erection. The central fountain has been stripped of the shrubs and flowers with which it was decked out on the first day, and is in slow process of preparation for its real purpose. There is no hurry about turning on the water within as long as so much is falling without. The very keepers of the various restaurants, who might have been supposed to have been spurred on by the keenest self-interest, considering the enormous prices they charge, are only beginning gradually to open their blazing establishments. As if to confound confusion, the weather has been frightful; rivulets flow down the centre of the walks, and lakes spread themselves everywhere over the ground; where no gravel has been laid down, the clay has been converted into stiff red slime; for the site of the Exhibition is naturally a swamp, and the building is erected Dutch-fashion upon piles. The only means of approaching it on the English side was to wade ankle deep, until the Commissioners had the consideration to throw pontoon bridges of plank across the dismal swamp.

The Imperial Commissioners who have taken charge of the arrangements are not to be held responsible for the horrible weather, although they might have made some better preparation against a contingency that was by no means improbable in an Austrian May. But so far as other things are concerned, and all allowances have been largely made, it must be confessed that they have trespassed considerably on the long-suffering of the world which they invited to Vienna for the first of the month. The fact is, that there has been extraordinary miscalculation from the first, and all throughout. Even had the show been one of ordinary dimensions, and had Austria been on a level with the most advanced countries in her means of communication and the excellence of her traffic arrangements, there was little enough time to do all that she had to do since she first went to the work in earnest in last June. But it is only recently that Austria has been betaking herself to commerce on a large scale; she has few seaports, and they are far removed from the capital, while Vienna lies on an insignificant stream, not on a great navigable river, or in the close vicinity of the ocean. Her communications are altogether out of keeping with her new aspirations and with the present excessive strain; the great railway to the west consists only of a single line. Then the citizens of Vienna are semi-Orientals in their easy manner of going about the everyday business of life. Even the stimulant of extraordinary wages will scarcely induce them to put on a spurt. Above all, the original scheme developed its proportions so rapidly that all the original calculations as to time must have been falsified. The first idea seems to have been to have made a commonplace Exhibition of it; probably a reproduction of its Western predecessors upon a considerably smaller scale. It was matter of great speculation whether the Exhibition mania had not pretty nearly exhausted itself, or whether countries that had won honours in London and Paris would submit to the trouble and expense of exhibiting so soon again in a remote inland capital. Whatever may have been the hopes of Baron Schwarz, the Chief of the Imperial Commission, the original estimates which he presented to the Reichsrath showed what his proposals were. The event showed that the world appreciated the exceptional advantages of the position of Vienna as an exhibiting centre. The West and the East were simultaneously incited to meet and compete in their respective productions. Trusting in the financial success of his comprehensive scheme, and relying on a prospective vote of indemnity, Baron Schwarz went altogether beyond his allotted tether; and the Reichsrath, in spite of itself, has been dragged along behind him, scattering florins broadcast, and compelled to endorse an expenditure at which economists shudder. Probably the Baron is right and the economists wrong. But it is obvious that in the meantime he has been expanding his ideas without due regard to the capacity of his country for carrying them out in detail, and that, in holding punctually to the day fixed for the opening, he has been deluding his victims with a mere shadow of the substance which they may hope to see if they only have patience.

There can be little doubt that the show will be worth the waiting for; that, in striking interest as well as in picturesqueness, the Exhibition of Vienna will eclipse all that have gone before. It is true that a good many exhibitors from the West, men who have made their reputations and won their medals and certificates elsewhere, are conspicuous by their absence. Yet there is scarcely a class that does not appear by leading representatives, and, as a rule, all that is sent is more or less excellent of its kind. England shows, or rather promises to show, very strongly. If a great many of the goods are not as yet forthcoming, they are all catalogued, and we may judge what they will be. In machinery, especially in agricultural machinery, for which there is a great and increasing market in the East, it would seem as if our manufacturers would more than sustain the credit of their country. Nothing is more significant than the number of leading partners of eminent firms who are gone to Vienna with the intention of making a long stay there, of explaining their patents and conducting their sales in person. So in the other industrial departments, and especially in that of the finer specimens of the ceramic art, where there are also many foreign competitors in the field, most of them more or less formidable. France, of course, has always excelled in this branch of manufacture; Austria has been making great strides in it of late, and exhibits very largely; while Germany, Portugal, Hungary, and the Eastern Kingdoms are all represented by their potters. To Englishmen at least few things in the Exhibition will be more curious than the display from India, which would appear to have been designed with a completeness that will leave little to desire. It is premature to pronounce upon the contents of the Colonies department, for as yet, with the exception of the Cape, little or nothing is forthcoming, but report speaks highly of what they are likely to be.

Some time ago, when writing on the prospects of the Exhibition, we dwelt on the characteristically picturesque element which we expected to find in it. Our anticipations have evidently been more than realized. It would seem as if the partially civilized nations which have been recently emerging from their jealous seclusion had determined upon a grand simultaneous effort to show what they are really capable of. Very fortunately they have taken time by the forelock, as if they were resolved to falsify all our ideas of Oriental apathy and sluggishness; and those which geographically lie the most remote are among the most forward of all in the Vienna showplace. So far as their preparations go, they have shown a financial profusion which contrasts strongly with our modest English Government grant of 6,000*l*. But, in fact, such sovereigns as the Sultan figure very much as private exhibitors. Still more does his great vassal the Khedive, who holds the better part of his land of Egypt in personal property. Egypt, although perhaps it is more nearly complete than any of the other countries in the West or East, still tantalizes the visitor provokingly behind the high screen of boards which it is forbidden to pass. But if you can contrive to pass over them, you get a glimpse of what looks like a complete epitome of Egyptian life and history from the days of the Pharaohs to our own. Japan, as becomes a country which has recently revolutionized all its institutions, shows herself far less exclusive. One is permitted free access to where the quaint and beautiful collection is growing daily, and the goods have been brought over under the charge of natives who understand the art of display as well as that of production; while the whole is under the direction of Japanese Commissioners who are familiar with more than one of the Western tongues. The Japanese, with their wonderful capacity for adaptation and imitation, wear the Western dress as if they had been born and bred in the manner of it, although there is no mistaking their features when you meet them. But there are other Orientals who are less pliant in their habits, and already the Viennese find some outlandish figures and quaint costumes to stare at. They will learn more about these strangers and their ways when they have opportunities of inspecting the interior of all these Oriental buildings, which as yet are hidden in scaffolding and accessible to nobody but the workpeople. But if the men of the East enjoy great advantages in the way of decoration, in the gorgeous stuffs of brilliant colours which they bring with them, those of the West show perhaps even greater taste in disposing of materials that lend themselves far less easily to artistic purposes. Art and taste have presided everywhere; for example, in those great agricultural halls where the produce of the Austrian provinces, and especially of Hungary, is displayed—corns and wines, and oils. The very implements of mining and husbandry are artistically disposed, and there is real art shown in the shapely simplicity of such displays as the great coal trophies. As to the courts of the fine arts proper, visitors as yet can only obtain admission to them by favour; and once within the barrier, you find that the pictures are for the most part but half hung. England has had a comparatively small space assigned to her, and exhibits but a comparatively small collection; fortunately, however, the quality of her specimens seems highly creditable, considering the difficulties under which she laboured in getting them together. France, on the other hand, with four times the space, and showing some of those celebrated works which are public property, will certainly have to cover the walls with a great deal that is decidedly inferior. But, in spite of some shortcomings of this kind, and of those wearisome delays which are almost inexcusable, it is scarcely possible to question the triumphant success of the Exhibition.

EMANUEL HOSPITAL.

BEYOND the City clique on one side, and the small knot on the other who have identified themselves with the Endowed Schools Commission, we fancy that there were not many members in the House of Commons on Tuesday night who felt very deeply moved about the immediate result of Mr. Crawford's motion on Emanuel Hospital. The party which he led was actuated by various motives besides a dispassionate preference for the scheme propounded by the City to that under which Lord Lyttelton's Commission proposes to recast Emanuel Hospital. The palpable disparity between Mr. Forster's comforting assurance—made four years since on the second reading of the Endowed Schools Bill, that, "It is not for the good schools that this Bill is framed; we cannot of course exempt such schools by name, for in that case there would be no end to endeavours to obtain it, but schools which are well managed need fear nothing from the operation of a Bill which is to introduce good management"—and the sayings and doings ever since of the Commissioners named by himself and under his own Bill, was persistently insisted on. Neither Mr. Hobhouse's assertion that "donors to public uses are less under the guidance of reason and conscience and more under the sway of baser passions than other men," explained by his boast that "the grasp of the dead hand should be shaken off absolutely and finally," nor Lord Lyttelton's cheerful remark that "the pious founder must go to the wall," was forgotten. The statement of the Commissioners, in their Report of 1872, repudiating the conclusion that they were "to leave a given governing body materially unaltered in its composition unless" they could "establish against it a case of abuse or breach of trust," was quoted as being in flagrant contradiction to the principle volunteered by the author both of the Bill and of their powers as defined in it, in consequence of which an opposition which might have been very troublesome was undoubtedly laid. Appeals were made to the encouragement of voluntary munificence which characterizes our whole English system, social and administrative, in contrast to the jealous restrictiveness which underlies the centralizing organization of other countries; and the practical loss which would attend the paralysis of the giving faculty under the operation of principles like those of Mr. Hobhouse was plainly urged. Under these feelings lay the intelligible rebellion of the more generous impulses of human nature against the hard and doctrinaire repudiation of purely eleemosynary education, under all circumstances, upon which the Commissioners seemed to rely with a faith which would not have been misplaced if their dogma had been a freshly revealed chapter of Holy Writ. Irrespectively of these demurrers, the conduct, not so much of the Commissioners as of the Government under which they were acting, was severely criticized for the indecorous precipitancy with which they sought to carry a scheme on which, in its character of a leading precedent, they themselves had set a value which it would not have naturally possessed, at a time when the conduct and policy of the Commission—not to say the question of its longer continuance—were under examination with the Government's own consent before a Committee of the House of Commons.

These various reasons were feebly combated by Mr. Gladstone and Mr. Forster. The former indeed began by acknowledging that "we ought to encourage the liberality of private foundation by showing a great and studious respect, of course within the limits of reason, for the wills and wishes of founders"; while the Vice-President did exemplary penance for that incontinence of tongue which he could neither deny nor explain away. But upon their side they urged with great force the wide scope and superior advantages which they attributed to the constitution for Emanuel Hospital proposed by the Commissioners, and they appealed to the considerable share in its governing body which the Commission had in its second and amended scheme reserved for the Corporation of London, while neither of them showed the slightest disinclination to search out the weak places in their adversaries' harness. The result was that, with the exceptions which we have already indicated, members voted in general accordance with the side of the House to which they belonged; and the trial of the Endowed Schools Commission, whether it is to result in their acquittal or their condemnation, stands adjourned. In fact, the decision as to Emanuel Hospital was, so to speak, *in personam* and not *in rem*. How the Commission may fare when the far more important case of the Birmingham School comes on for discussion remains to be seen, but the real debate will come when the Committee which is now sitting upon it has made its report, and when the Government proposes such a Bill as it may think wise to found upon the results of the inquiry.

The one remarkable event of the evening was the unexpected opportunity which the discussion afforded to Mr. Gladstone of again displaying his characteristic quality of reckless impetuosity. His position from his own point of view was that of defending a body of men whom he knew to be unpopular with many important and active sections, and who at this moment were on their trial for their general policy, before a Committee moved by his own authority, while he believed himself able to make a strong case in their behalf. The attacking party was that special *imperium in imperio* with which, alike from the venerable tradition of centuries and from a well-calculated consideration of its powers of helping or hampering the powers that be, every successive Prime Minister has been in the habit of maintaining relations of high politeness. At the present moment, too, one of Mr. Gladstone's most indispensable and respectable colleagues represents the constituency in which the Corporation of London is pre-eminently powerful; and his own seat is due to the forethought of an active alderman; while the case which the Corporation were supporting, whether or not a strong case, was one which it was neither dishonourable nor unreasonable on their part to press with peculiar assiduity. So every motive, both of personal interest and of official dignity, combined to make it the part of the Prime Minister, while demolishing the City scheme for reforming Emanuel Hospital, and while upholding the action of the Endowed School Commissioners to the utmost of his great powers, to do so with a studied respect for the position and the motives of the ancient corporation which had challenged the issue. But Mr. Gladstone was on Tuesday evening equal to his old self in those proud days when he burnt his ships, broke down his bridges, and crossed the Rubicon, when he took all human flesh and blood to his expansive bosom, or when he danced, tomahawk in hand, round the three-branched upas-tree. With a freakishness like that which he displayed on the spent Wednesday afternoon when he jumped up to prophesy the further debasement at no distant date of the recently lowered franchise, Mr. Gladstone selected this comparatively minor matter of Emanuel Hospital to declare war, in phrases of elaborate bitterness, against the Corporation of London, "gorged and almost bloated with charities," "the body which has enjoyed for thirty odd years the proud distinction of being the only unreformed corporation in the country." With all his genius, after his now forty years' experience of public life, and the sobering discipline of the highest office, Mr. Gladstone does not yet seem to have fully appreciated that the words of a Prime Minister can never be like those of any other man. This rolling vituperation may have been in his mouth only a piece of rhetorical gag, and all that he meant may have been to snub the City for an act of impertinent insubordination. But, as Mr. Forster took opportunity to say later in the debate, not without reference to his own unlucky promise about the good schools, "a clever speech generally hangs round a man's neck for the rest of his life like a mill-stone," so that when it is "thrown back upon him" he is "generally sorry that he made it." Whatever Mr. Gladstone may himself have meant, this notice to the Lord Mayor to quit will be as little forgotten in the caucus of advanced reformers as it will be in Guildhall and the Mansion House. We can only wonder at the recklessness of the Minister just returned to office on sufferance, who has voluntarily complicated the almost hopeless difficulties of the divided Liberal party by a gratuitous and unexpected attack on that one body which has always retained the secret of power by subordinating the discordant claims of any wider partisanship to the interests and the dignity of the Corporation of London.

MERCHANT SHIPS AND SEAMEN.

MR. PLIMSOLL, in moving the second reading of his Shipping Survey Bill, anathematized "the long, low, narrow, overloaded beasts of ships" against which his measure was directed, and the "scoundrels" of shipowners who sent them to sea; told a story of "a well-known shipowner" of Shields who had made his money in such a way that, when he died, the police had to guard his remains to the grave, on account of the multitude of women and children who followed to pelt the hearse with mud; and called upon the House of Commons to pass the Bill with acclamation. It is evident that Mr. Plimsoll's peculiar style of advocacy is better suited for the platform than for a legislative assembly, and, after a round of indignation meetings, he is naturally disappointed that the House of Commons did not instantly pass his Bill with three cheers for the author. On Wednesday night Mr. Plimsoll attended a meeting at Birmingham, and complained that his Bill had been "talked out," which is no doubt true, in the sense that the debate on it was not concluded at the hour when the House of Commons is, by an old rule, compelled to rise on Wednesday. But Mr. Plimsoll forgot to mention that he did most of the talking himself. It was late in the afternoon when he rose, and it is absurd to suppose that the statements he made could be allowed to pass without reply. Mr. Plimsoll has had months and months of agitation, has published a book, delivered innumerable speeches, and attacked the shipowners in every possible way, and now he considers it monstrously unfair that a single shipowner should venture to defend his class, and to warn the House against passing what he believes to be a mischievous and dangerous measure. Mr. Plimsoll is perhaps a vigorous agitator, but he is a very poor statesman. Even if his Bill were a sound practical measure, the fact that a Commission is now inquiring into the subject, and will soon report, would be a very good reason for not passing it just at present; but it is not a sound practical measure. It is crude and imperfect, and it is doubtful whether it could ever be worked. Mr. Plimsoll himself has admitted that the Bill would have to be recast in Committee—in other words, that the House would have to construct a Bill for itself. The President of the Board of Trade has introduced a short measure for the purpose of giving greater stringency to inspections by officers of that department; and the shipowners, now that they know that the eyes of the country are upon them, and that further legislation is impending, may be expected, for their own sakes, to be very careful what sort of vessels they send to sea during the next few months. Next year the House of Commons will have the ad-

vantage of a great body of valuable and authoritative evidence to guide its deliberations.

It would appear that the effect of Mr. Plimsoll's agitation has been somewhat weakened by the discovery that there are two sides to the story, and there is perhaps some danger of a reaction the other way. On the whole, it is rather an advantage to the Devil to be painted blacker than he is, since people comparing the original with the portrait are apt to fancy that after all he is scarcely black—only a sort of slate-grey. Mr. Plimsoll has apparently not the faintest conception of what is evidence and what is not; all is grist that comes to his mill; and he has undoubtedly injured his case by mixing up all sorts of wild and improbable stories with real facts. There is, however, abundant evidence to show that the mercantile marine is in a very unsatisfactory state. A return, for example, has just been issued of cases in which ships have been surveyed on the requisition of seamen which contains some highly suggestive information. There is a report by the Harbour-master of Holyhead on the case of the steamship *Orontes*. Eight seamen of the vessel refused duty on the ground that she was unseaworthy. The Court held that the *Orontes* was not unseaworthy, but that "the forecastle, where the sailors forming that portion of the crew were put to live, was leaking and quite unfit for its duties when the ship left Liverpool," and that "on the passage the clothing and bedding of the men became wet, and their life [was] rendered miserable." The Court also expressed the opinion that great carelessness had been shown in the entry of the crew, some having come on board as the ship was undocking without even a shift of clothing. "These men were found to be incompetent for their duties"; but the Court thought that the "remedy taken to make them competent was quite an unjustifiable one." It is not difficult to agree with this opinion when we learn that the remedy took the form of "harsh treatment, beating, and knocking down, added to abusive language." The Court went so far as to suggest that "such a course was to be deprecated"; and then the judgment winds up abruptly thus—"The Court, taking all these circumstances into consideration, sentences each prisoner to one day's imprisonment." It must be observed that the men had presumably already been in prison while the survey was being made, that "two of them had marks on their faces of severe ill-usage," and that, although the ship was pronounced to be not unseaworthy, the forecastle was shown to be quite unfit for the reception of the men. When we turn to the surveyor's report, we find that it relates apparently, not to the condition of the vessel as she came in, but to her condition after she had been patched up with vulcanized india-rubber plugs and other things. We have only to put ourselves in the place of the seamen, and to imagine how we should feel if we were sent to prison for refusing to go in a ship which was declared to be "quite unfit" to receive us, and in which our lives would be made miserable by continual drenching. There is a clause of the Merchant Shipping Act of 1867 by which it is an offence to have insufficient and improper accommodation in the forecastle of a ship. Here is another case, the particulars of which are given in a letter from the Board of Trade to the Home Office. The *Elizabeth Knowles*, on a voyage from Liverpool to Monte Video, was found to be leaking considerably, and put into Milford. Four seamen refused to go on board again, and, on the report of a retired harbour-master that the ship was seaworthy, they were committed to prison. The vessel left one crew in prison and went to sea with a fresh crew, but had, on the very night of the day she started, to put back with three feet of water in her hold. Upon this the men in prison appealed to the Board of Trade, and the Board ordered a survey by one of their own officers. From the surveyor's report it "was clear that the vessel was quite unfit for sea," and the first crew was released from prison. Yet, in spite of these successive warnings, the ship put to sea a third time and had for the third time to turn back. This case led to a circular from the Home Office warning magistrates not to trust to the opinions of retired harbour-masters and people of that sort, but to call in one of the Board of Trade surveyors. In March last two men of the *Sir Robert Mc Donnell* were sentenced to ten weeks' imprisonment for refusing to proceed to sea in her. When examined by a surveyor, the ship was found to be leaky and unseaworthy, "water being distinctly heard running into her." The Home Office thereupon ordered the release of the men. It would appear that a good deal of the work of the Home Office consists in releasing seamen who have been imprisoned by the local magistrates for objecting to be drowned, and that seamen are also liable to be locked up for refusing to go to sea in a ship "quite unfit" for their reception, and in which their lives would be made "miserable." It is not perhaps surprising that there should be a strong impression on the part of the men that the chances are rather against them if they appeal to the law, no matter how strong their case may be.

We will take one or two other cases from this return. In September seven seamen of the *Petrel* lodged a complaint as to the unseaworthiness of that vessel. The Collector of Customs at Poole reported that the vessel came in much too deep "even for a coaster," which is no doubt saying a good deal. She had a house on deck of unusual size, which in a heavy sea would most likely be carried away, or the vessel would be lost. The surveyor generally confirmed this report, adding that eight men were berthed in the forecastle where there was room for only five. One of the crew gave the following account of his experiences on board this ship:—"Water flowed into the forecastle, and washed all over ourselves and bedding. The first day we got out of the Downs we had to put all our bedding round the funnel of the steamer to dry them. We could not sit at our meals, as the water came pouring down on the top of us. The water used to drive over the deck and flow into the engine-room, so that the hands could not stand above or below deck. We had no close bulwarks, only stanchions and rods, so that a man could easily pass through between one rod and the other." The result of the case was that the crew were paid off, the magistrates declining to make any order. Clause 10 of the Merchant Shipping Act (1871) directs that an unseaworthy ship shall be detained. In November the *Eleanor* was declared unseaworthy, and the charge against the crew dismissed. The surveyor thus described the vessel:—Making three-eighths of an inch of water in one hour and a quarter in smooth water; in the hold "timbers rotten and also ceiling," two iron knees broken; locking knees to whole beams generally bad, some of the beams bad too; leakage fore and aft under waterways; some timbers rotten, and so on. He adds, "This vessel is, I believe, thirty-four years old, not classed; has been sold as a wrecked vessel on one occasion at least." On the 30th of January seven of the crew of the *Huntress*, of Glasgow, refused to go to sea in her. She was surveyed and declared unseaworthy, but immediately sailed out under Bremen colours. She was examined by two surveyors, who reported that she was leaky and worn in parts, with "the topgallant forecastle departed from the ship's side"; and on a subsequent inspection they found "signs of extensive decay." Some of the reports in this Return also illustrate the differences of opinion which are apt to arise between surveyors as to the state of a ship.

An official report on the supply of British seamen by Mr. Gray and Mr. Hamilton of the Board of Trade also deserves attention. After careful inquiry, those gentlemen came to the conclusion that the British seaman, "though he might be better, has not grown worse," and that there is no lack of men for the requirements of the trade. It is true that inferior men often go to sea as "half-marrows," and that there is a considerable proportion of foreigners in our mercantile marine; but, "if it were an evil from a shipowner's point of view that 'half-marrows' and other such persons go to sea at low wages, and that foreigners serve on board British ships, and if those evils required remedy, they would be remedied by attracting better men and British subjects, by offering better wages." Seamen in the British merchant service, on the whole, receive higher wages than seamen in any other merchant service, with perhaps the exception of that of the United States; but the wages of skilled workmen and labourers on shore are higher still. There is only one way of meeting this competition, and that is by offering greater inducements to men to go to sea than to remain on land. The influence of wages is shown clearly enough in the tendency which has been observed of good seamen and bad seamen to get together in separate groups. The good seamen, we are told, get into ships affording constant employment and making regular voyages, where they get healthy accommodation, good food, and good wages; the worse seamen, on the other hand, get together in ships of an inferior class. The medical inspection of seamen is a question which certainly deserves consideration. Under the present law this examination can be made, provided that the men agree to submit to it, and that the owner is willing to pay for it; but practically the provision is a dead letter. The consequence is that men are often shipped in an utterly unsound condition, and are put out at foreign ports sick and destitute. Dr. Patterson, the Superintending Surgeon of the British Seamen's Hospital at Constantinople, remarks that, "since the introduction of screw-steamers into the Levant, Danube, and Black Sea trades, men are landed at hospital suffering from severe forms of chronic disease and broken-down constitution." "The majority are shipped in a diseased state, and many of them barely reach Constantinople alive; old and broken-down drunkards, men far advanced in consumption, and old men far beyond the period of active service seem to be indiscriminately shipped." As the country has to pay large sums for the medical and hospital expenses of distressed British seamen abroad, and for their maintenance and conveyance home, shipowners might not unreasonably be required to ascertain before shipping their crews that they are fairly sound. Mr. Gray and Mr. Hamilton suggest that shipowners should be compelled to pay for diseased sailors left abroad, unless they could show that they were medically examined and pronounced to be in sound condition before leaving the United Kingdom.

THE VISITATION OF THE CHAPTER OF LINCOLN.

THE visitation of an English cathedral church by its Bishop is an event which has been in late times, though not altogether unknown, yet strangely and lamentably rare. It is indeed strange that it should be so, that the Bishop should be less at home in his own church than in any other in his diocese, that the church which draws its whole rank and importance from containing the Bishop's official place, whose name and distinctive character come wholly from its being the seat of his *cathedra*, should be the church of all others where his authority is most unwillingly admitted, and where his presence and ministrations are, to say the least, not welcomed as they commonly are in the other churches of his diocese. But, whatever may be the cause, it is certain that, for a long time past, on the one hand the Chapters have thrown aside their proper diocesan position

and diocesan duties, and on the other hand the Bishops have seldom interfered with any authority as to anything that has gone on within the walls of the cathedral church. No policy could be more shortsighted on the part of the capitular bodies. We who wish to preserve, and therefore to reform, them know that their only chance of preservation is by showing themselves to be really useful institutions with a definite work before them. If they persist in cleaving to the character of sinecurists, dignified perhaps and ornamental, but with no intelligible duties to discharge, they are certainly doomed. Their fate lies in their own hands. Those Chapters which obstinately persist in treating the mother church of the diocese as if it were the private chapel of four or five clergymen, in shutting out as far as they can the Bishop on the one hand and his flock on the other, in thwarting every effort of zeal from whichever side it comes, in seizing on every paltry excuse to stop the round of services which it is to be supposed that they look on as a burden, are simply pulling down their house about their own heads. Only perhaps it is all one to them if it is pulled down. The house may fall and others may weep at its fall; it will be enough for its present inhabitants if the sacredness of vested interests allows them to slumber on somewhere or other for the rest of their days. Such however, we are happy to say, is not the spirit of all capitular bodies; and we may look on the searching visitation which the present Bishop of Lincoln has just begun at his cathedral church as something which bids fair to be the beginning of a better state of things. The Bishop's right to visit, not only when called in to settle any dispute, but by his inherent authority as Ordinary, cannot be reasonably doubted. That matter was set at rest six hundred years back by the great Robert Grosseteste, and for five hundred years after his time the Bishops of Lincoln went on visiting, oftener or more rarely, according to circumstances or according to the amount of their zeal. If we rightly understand Bishop Wordsworth, no visitation has been held since 1751; but he at any rate seems determined to clear off the arrears of sixscore years in good earnest. He began by reprinting and circulating the Statutes of the Church, a document important both in a practical and in an antiquarian point of view, and which we may perhaps some day find occasion to notice in another part of our columns. On the 29th April the Visitation itself began: the Bishop was received in due form by a great majority of the dignitaries and other members of the Chapter—a body which, in the ancient church of Lincoln, numbers no less than fifty-six members. Few, if any, had ever before seen such gathering of canons residentiary and non-residentiary filling their proper stalls in choir and chapter-house. The Bishop delivered a charge to the members of the Chapter and all other members, clerical and lay, of the church of Lincoln, and put forth a set of Visitation Articles, the answers to which are of course not yet forthcoming.

The documents which have been put forth by the Bishop of Lincoln are chiefly remarkable inasmuch as they show how much may be done in an old-foundation church by simply carrying out the statutes by which its members are bound, without asking for anything to be done by Act of Parliament. To make an old-foundation church what it ought to be, there is really very little to be done except for every member of it to do his plain duty instead of shirking it. Of course this only applies to old-foundation churches; the constitution of the new foundations is so lame and imperfect that they do need some external power to reform them after the pattern of the old. Thomas of York, Remigius of Lincoln, and Robert of Wells have shown themselves more practical legislators, even for the nineteenth century, than King Henry the Eighth. It is plain to any one who looks at the Statutes and at the charge and Visitation Articles put forth by the Bishop that there is really very little needed to bring back the good state in the church of Lincoln, except for each of its members to set diligently to work in his own vocation and ministry to carry out the purposes for which he was put there. It is just the difference between an old foundation and a new, that in the old foundation there is practical work ready cut out for the chief members of the body, for those whom it is desirable to keep in constant residence on the spot. In fact, our only difficulty in speaking of Bishop Wordsworth's charge is that the points which he insists on are the same points which we ourselves have insisted on over and over again, whenever we have spoken about these matters. But then they are points which cannot fail to be perfectly obvious to every one who gives any measure of serious thought to questions of this kind. The Bishop of Lincoln has clearly gone to the root of the matter; he puts forth his scheme of reform in the form of a few simple and practical suggestions, all of which can be carried out without any change in the law as it stands. Indeed, as the province of Canterbury has already a Provincial Dean and a Provincial Precentor, it might not be amiss to add a Provincial Chancellor in the person of Bishop Wordsworth, in order that he may have the opportunity of instructing his Metropolitan in the nature and objects of a cathedral church, and of explaining to him the difference between an old and a new foundation.

The chief points on which the Bishop insisted will thus almost be taken for granted beforehand. They amount simply to the getting rid of those abuses which have made our cathedral system a byword; abuses which few attempt to defend except those who profit by them, and which they seldom try to defend, except by the easy, though often practically effective, argument of silence. Men who hold offices are to do the duties of their offices, and therefore, as a matter of course, they are to live at the place which is the main centre of their duties. Bishop Wordsworth sums up the great evils of the present state of things in the two emphatic words "pluralities and non-residence." He has no sympathies, such as his Metropolitan has, for the shameless abuse by which "residence" is construed to mean nine months' absence, and that even in the case of dignitaries who have special and constant duties. Bishop Wordsworth does not, like the Archbishop, think it an advantage to have the chief places of his church employed to increase the incomes of Professors and others whose duties lie somewhere else. He wishes the dignitaries of the church of Lincoln to be working members of the church of Lincoln. He will not abide—at Lincoln happily he is not called upon to abide—a Precentor or a Chancellor, having constant duties on the spot, but who thinks that those duties are discharged by staying away three-fourths of his time. The contemptible argument which we have heard in pluralist mouths, that they must heap to themselves preferment elsewhere, because their incomes—incomes far above the average of clerical incomes—are so small, the Bishop does not stoop to answer. But he shows that the shameless practice of nine months' absence is in many cases a mere evasion of the Act of Parliament on which those who practise it profess to rely. The clause which requires a residence of "three months at least" is meant to enforce that amount of residence in certain new foundation churches where the term of residence had been cut down to something shorter still. It is not meant to release those who, either by local statute or by the manifest requirements of their office, are bound to a longer term from the discharge of their plain duty. For the modern idea of "the canon in residence"—the meagre representative of forty or fifty brethren whose sudden sickness, promotion, or death often leaves the church without any capitular member, and whose idle caprice sometimes leaves it without any divine service at all—the successor of Robert Grosseteste has as little respect as Robert Grosseteste himself.

On the other hand, while Bishop Wordsworth insists thus strongly on the necessity of dignitaries and other residentiaries really residing and doing their duties, he insists no less strongly on the necessity of restoring the non-residentiary canons, those who are not bound to residence on the spot, and whose duties are not constant but only occasional, to their proper place as members of the Chapter. He shows, what no one but a member of a residentiary oligarchy could ever have doubted, that the non-residentiary canons are just as much canons, just as much members of the Chapter, just as much entitled to have a voice in its affairs, as the narrow body who commonly shut them out of their rights. He exposes the modern vulgarism by which the name "canon" is confined to residentiary members—he might have given a passing kick to the further vulgarism of calling them Canon Snooks and Canon Tomkins—and that of "prebendary" to the non-residentiary members. He shows that every prebendary is a canon, and that every canon is, or ought to be, a prebendary. He pithily insists that the ancient formula by which every canon alike, residentiary or non-residentiary, is admitted to "a stall in the choir and a voice in the chapter-house," shall again be a reality. On this subject we have often wondered at the change of mind which at a certain stage of their lives must come over many of those who have practical experience of the matter. The residentiary canon has in many places—in some churches in all cases—once been a non-residentiary. It is to be supposed that, when he was a non-residentiary, he did not approve of being shut out of his rights; yet, when he becomes a residentiary, he seldom shows any zeal to restore those rights to those who are still left out in the cold. When and how does the change come upon him? When and how does he become convinced of the beauties of oligarchy? Most Oxford men will remember the old state of things at Brasenose, when a few of the senior Fellows exercised all the authority and received incomes many times as great as those of the rest of their brethren. It was wonderful to trace the change of opinion in the mind of a Fellow of Brasenose as he advanced step by step in seniority. At his first election he was bitter against the wickedness of oligarchy, and held without doubt that the incomes and authority of all the Fellows of the college ought to be equal. But gradually a new light used to dawn upon him. When he had got up a few steps, he began to think that the case was not quite so clear as he had once thought it, that there really might be something to be said on the other side. When he found himself, as the technical phrase was, "on Pisgah," when he saw the promised land as something near into which one more step would bring him, he thought that the arguments in favour of the seniority system were far stronger than those against it. Once a senior, he had no longer any doubt upon the matter, and looked on all who would disturb him in the enjoyment of his oligarchic paradise as pestilent innovators. The change here was remarkable, still it was less remarkable because it was gradual. The convert had plenty of time; he did nothing in a hurry, he did not throw off the convictions of a life in a moment. But there are no such breaks and stages in the case of a non-residentiary canon who suddenly finds himself changed into a residentiary, one thereby bound to defend all the abuses which he has hitherto spoken against. How is this sudden change brought about? It cannot be by virtue of any ceremony conveying special enlightenment, as the alleged change in St. Thomas of Canterbury was said to have been brought by the grace of his consecration, or as some have held that the past sins of kings are wiped out by the holy oil of Rheims or elsewhere. For the canon, residentiary or non-residentiary, is, as being admitted to a new office, installed with religious ceremonies at his first appointment; but when the non-residentiary is simply called into residence, he is not admitted to any new office, and therefore

no religious ceremony takes place. We might conceive that the installation of a precentor might endow him with special powers of singing, or that the installation of a chancellor might endow him with special powers of instruction. But there is no installation of a residentiary as such which can clothe him with the gift of believing that he ought to keep his former brethren out of the chapter-house, or which can give him such new views of the use of language as to believe that residence means an absence of nine months. How then does this remarkable change come about? What is the exact process of conviction, intellectual or moral? All that we can do is to ask some of our residentiary friends to favour the world with their confessions.

On one point only, and that not a point of principle, could we have wished the Bishop of Lincoln's address to be other than what it is. We cannot conceive why he should have gone out of his way to object to calling Lincoln Minster Lincoln Minster. Now few things are more offensive to our ears than the modern affectation of dragging in the awkward modern substantive "cathedral" in all times and places. The church whose full style is, of course, the Cathedral Church of St. Mary in Lincoln, has for ages been known in common speech as Lincoln Minster. We can see no reason why it should not go on being so called. The Bishop says that it is not a minster because it never was a monastery, and that so to call it confounds the distinction between regular and secular churches. Undoubtedly, as far as etymology goes, a minster means a monastery, and most certainly the church of Lincoln never was a monastery. But then, according to etymology, a monastery ought to mean a place where a man lives all by himself, whereas for thirteen hundred years or more it has meant a place where a particular class of men live in common. For a thousand years or more the words *monasterium*, *münster*, *minster*, *moutier* have, besides their original sense of monastery, come to have the secondary meaning of any great church—in some places any church at all—whether monastic or not. In the case of the English, French, and German words this secondary sense has quite driven out the primary. No one would call a monastery as such a *minster*, *münster*, or *moutier*. In fact, both in England and in Germany, the name is most commonly applied to churches which, like York, Lincoln, and Southwell, like Strasburg, Basel, and Zürich, never were monastic. The word is fully established by the usage of ages, and it is convenient as a name to distinguish great churches with a foundation, whether cathedral, collegiate, or conventual, from those which are simply parochial. As a technicality of antiquarian description it cannot be dispensed with. To talk of "Lincoln Cathedral," though the fashion is coming in, is really much the same as to talk of "Southwell collegiate"—in French, if they say "la cathédrale," they say also "la collégiale" and "l'abbatiale." The word "minster" takes in all; but of course it always means the fabric of the church itself, not the foundation or the subordinate buildings.

THE WEST COAST OF AFRICA.

TO the majority of Englishmen our West African possessions are only associated in a dim sort of manner with ivory, gold dust, palm oil, slaves, the King of Dahomey and his "customs." Some who have indulged in discursive reading may bethink them of Governor Wall, who flogged a soldier to death and was hanged in consequence, and of "L. E. L.," whose melancholy fate is still within the memory of contemporary history. Other conscientious devourers of the daily papers may remember that every now and then an African mail has brought intelligence concerning the quarrels of two rural potentates called Ja Ja and Oko Jumbo. We doubt much whether there are many, even among educated people, who could tell the names, or even the approximate positions, of our settlements on the West Coast of Africa. One reason may be that nobody goes there who can help doing so, and that very few who do go return. Yet our West African settlements are important in more ways than one. It is undoubted that they exercise a civilising influence on the savage races which surround them; and if we abandoned them to-morrow, it would not be easy to prevent the revival of the slave-trade. As regards commerce also they ought to excite our interest, the value of the imports and exports being about a million and twelve hundred thousand pounds sterling respectively. Attention is now specially directed to Cape Coast Castle, on account of the invasion of that settlement by the Ashantees, who, having won a victory over some tribes nominally under our protection, were at the date of the despatch of the last mail within six hours' march of the seat of government.

The most northerly, and at the same time the oldest, of all our settlements on the coast is the Gambia, which is called after the river of that name. This river falls into the Atlantic a little to the south of Cape Verde, and, by means of it, intercourse with the interior of Africa, to a distance of several hundred miles, is carried on. The capital is Bathurst, situated on an island near the mouth of the river. This is a mere trading settlement, with scarcely any territory attached to it. Originally formed in 1588 by a Company which received a charter from Queen Elizabeth, the staple of its commerce long consisted in slaves. Proceeding to the South, we come to Sierra Leone, the seat of the Governor of all the West African settlements, and situated 8° 30′ north of the Equator. This colony was ceded to the British in 1787, and comprises a considerable amount of territory.

Between Sierra Leone and the Equator is a tract of Upper Guinea, known as the Gold Coast. Its capital is Cape Coast Castle, and it is the scene of the present disturbances. The colony comprises several minor settlements, of which Anna and Elmina—recently ceded by the Dutch—are the chief. It was founded by the African Company in 1750, under authority of an Act of Parliament. To the eastward of the Gold Coast is Lagos, the most recent, but, as far as regards imports and exports, the most important, of all our settlements in Western Africa. It was only acquired in 1862, when Docemo, the native king—who is still alive—ceded it to us in return for a pension of 1,000*l.* a year. Formerly it was the greatest slave depôt on the coast, and its possession by us has greatly contributed to the suppression of that traffic. It must not, however, be supposed that the neighbouring tribes would quietly submit to see their principal source of riches cut off; and, though awed by the vigour of successive Administrators—notably the last, Captain Glover—they have never ceased to give trouble. Their chief grievance is that runaway slaves have found at Lagos a secure asylum under shelter of the British flag, which, however, during Captain Glover's absence on leave, did not last year always prove a very efficient protection. Indeed on more than one occasion escaped slaves were by the aid of the ex-King Docemo carried off within sight of Government House. Two of these hapless captives committed suicide rather than again go into bondage. The troublesome tribes in question are the Egbas and Ijebus, sometimes called Jebus; and, in addition to the slave grievance, they have lately conceived that they were suffering under another wrong. They have for years past been engaged in intermittent war with a tribe to the eastward of their own territories, called Yorubas. These hostilities, of course, have been a great hindrance to commercial intercourse with the interior—an intercourse which the Yorubas, who are friendly to the British, and fully alive to the value of trade, have been ever anxious to maintain. The Egbas and Ijebus are the great obstacle to this, and levy heavy transit dues on all goods passing through their territory. Thinking that it depended on them to arrest all trade—and frequently they have thoroughly paralysed it—these savages have acted as if they were the masters of the situation, and in a position to bring pressure on the British authorities. In order to checkmate them, Captain Glover nearly two years ago determined to despatch a pioneer expedition in order to open up the country and to secure an alternative route to that which passed through the Egba and Jebu territory. The envoy, Mr. Roger Goldsworthy, an ex-officer of Lancers, and now Commandant of the Houssa armed police at Lagos, underwent serious risks and great hardships, but was completely successful. He found the Yorubas quite prepared to keep open the new route, and he established the most friendly relations with them. The Egbas and Ijebus, furious at seeing their power for mischief passing away from them, and conscious that if the new route were adopted the administration of Lagos would be independent of them, sought to baffle Captain Glover's scheme by means of intrigue. They found zealous coadjutors in the ex-King Docemo, and in both white and black partisans at the settlement. A new policy was instituted. The new road was not taken advantage of, and the result has been an almost complete paralysis of commerce, a great rise in prices at Lagos, the abduction of refugee slaves, and a spirit of determined hostility to British rule. Indeed, both Docemo and the two tribes above mentioned have openly avowed their intention of getting rid of the white strangers altogether.

It is, however, on the Gold Coast that the attention of the few who take an interest in West African affairs is at the present moment concentrated. Besides the settlements on the coast occupied by us, a considerable tract of country inhabited by the neighbouring tribes was years ago formally received under our protection. These tribes are collectively styled Fantees, or the Fantee Confederation. The Confederation, however, owing to discouragement received from us, is little more than nominal, and is only an agglomeration of independent clans, friendly to each other and loosely united from fear of their hereditary foe the King of Ashantee. The Colonial Office has formally approved of the principle of a Confederation, but has done nothing to promote it, and, rightly or wrongly, the Fantees are under the impression that their project is viewed with contempt by the local authorities. The Fantees, however, with wits sharpened by the instincts of self-preservation, foresaw the imminence of the danger which their so-called protectors failed to recognize, and the event has justified the note of alarm which they sounded. The Ashantees, indeed, are a formidable enemy, and have on two previous occasions given us much trouble. Formerly they held sway over the Fantee country and over the maritime district which we now occupy, and it was our wresting from them the seaboard and denying the sovereignty over the Fantees which brought about the war of 1824. Some rather sharp fighting took place, and ultimate success was only purchased by the expenditure of much money, and the loss of Sir Charles Macarthy, the Governor. For nearly forty years a sort of armed truce was observed, but in 1863 the King of Ashantee again declared war—a war which cost us 100,000*l.*, and one in which for months our troops endeavoured with much loss from sickness to bring the enemy to action, but in vain. Since then we have pursued a policy of conciliation, not to say subjectivism, sending presents with the messengers who proposed—or, as rendered by the natives, "swallow"—peace. All our efforts have, however, failed, and now for the third time within half a century we are at war with this fierce and untameable race.

What the cause of the rupture was no one seems quite able to say. The general belief is that the cession of Elmina to us by the Dutch has something to do with it. Mr. Knatchbull-Hugessen is of this opinion. It appears that the Dutch used not only to give a yearly sum of money to the King of Ashantee, but also to pay him so much per head for the captives he made in war. These captives were sent to serve as soldiers in other Dutch settlements, and certainly gained by the change of masters. When we took over Elmina, we made inquiries concerning this subsidy, and, learning that it was given not as tribute but merely for the encouragement of trade, determined not to continue it. Of course head money for slaves, under any circumstances, was out of the question. Irritated at such a sensible diminution of his revenue, the King of Ashantee, misinterpreting our conciliatory behaviour, presumed on our supposed weakness, and snatched at what he considered a favourable opportunity for driving us into the sea. Early in January last the Ashantees, in four divisions, and with numbers variously estimated by those on the spot at sixty thousand and eighty thousand men, crossed the Fantee frontier. Recent advices, however, tend to show that their strength has been exaggerated, and that the main body at all events is not more than thirty thousand strong. The border is only three days' journey from Cape Coast Castle, yet it does not appear that the Administrator took any steps to obtain trustworthy information. He never even noticed the invasion till the 3rd of February, and then he contented himself with a mere proclamation announcing the invasion, and prohibiting the supply to the invaders of munitions of war. The Ashantees in the meantime had themselves announced their arrival in the most energetic manner, having marched through the country plundering and burning in every direction. Taken by surprise at first, only 4,000 or 5,000 Fantees could be collected to oppose the enemy, before whom they were of course obliged to retreat. At length, however, the different chiefs managed to assemble an army of some 30,000 men, and a battle whose dimensions would have been considered respectable even in Europe took place. The numbers were about equal on each side, but the Ashantees possessed the advantage of being under a single commander, while the Fantees were a mere collection of clans each obeying only the order of its immediate chief. The fight was well contested, having lasted some eight or nine hours. At length the Fantees, having lost 1,000 men, and being short of ammunition, were obliged to retire, falling back, however, so steadily that the victors contented themselves with occupying the abandoned position. At this place, only seventeen miles from Cape Coast Castle, the Ashantees, who, though the conquerors, lost, it is said, 2,000 men in the battle, remained for some time waiting for reinforcements. We learn that the King of the Ashantees—his euphonious name is Carie-Carie—has sworn to drive the English into the sea, and that he is expected to head the reinforcements asked for by his commander-in-chief. Whether these reinforcements have arrived or not we do not know; but the invaders on the 7th April resumed the offensive. The Fantees had in the meantime been reinforced, and were encouraged by the presence of 120 of the Houssa police, under Lieutenant Hopkins, who had been tardily empowered to afford them substantial aid. A battle which lasted six hours took place, the Houssas fighting gallantly and losing two men killed and fourteen wounded. The Ashantees, however, gained the day, and Lieutenant Hopkins fell back with his detachment to the coast. The Ashantees must have bought their triumph dearly, for not till the 14th did they again engage the beaten, but still stubborn, Fantees. On this occasion the fight lasted fourteen hours, at the end of which time the Fantees were completely routed.

The first battle was fought at a spot about seventeen miles from Cape Coast Castle; the second action took place apparently at the same place, but the scene of the last engagement was no doubt nearer to Cape Coast Castle. At all events, it is said that the whole country is now in the hands of the invaders, and that we cannot be said to hold an acre of ground save what is commanded by the fire from the forts on the coast. The fortifications of Cape Coast Castle consist of an earthen work adjoining the road which leads to the town, a strong masonry fort on the shore, and a martello tower in which is kept the ammunition of the garrison. Unfortunately this tower is isolated, and the fort itself is overlooked at a distance of 300 or 400 yards by some high hills. Cape Coast Castle is, however, sufficiently strong both as regards fortifications and garrison to defy the dusky warrior, who is as unlikely to fulfil his oath as was his predecessor Quacoi Duah, who vowed in 1863 to cut off the Governor's head, and didn't. The outlying settlements are in a somewhat critical condition, their works being out of repair, ammunition being short, and the garrisons weak. Accra, for instance, was a short time ago only occupied by thirty negroes of a West Indian regiment, without an officer. It is to be hoped that the reinforcements which have been despatched from Sierra Leone and Lagos will be employed to strengthen these forts, for there seems to be no intention of carrying on any operations in the open field. The force at the disposal of the Governor consists of three men-of-war or gunboats, and 840 armed police, black soldiers and volunteers. Had it been desired, ten times that number might have been raised from among the Fantees, who, if well armed and led by Englishmen, would probably fight well. Fighting would however interfere with the moral force policy which seems to be in favour. Besides, Lord Kimberley denies that we are under any obligation to protect the protected tribes. It is not, he lately said, British, but only British-protected, territory which has been violated, and we have never pretended to defend it against aggression in the same way as British territory. To unsophisticated minds it would seem that here is a distinction without a difference, and that the meaning of protection is to defend the protected against aggression. To calm any apprehension that might be felt, he asserted that the Ashantees, who numbered only 4,000, were at the *back* of the protected territory. Information obtained from non-official sources gave the number at 30,000 in one body, and, indeed it is now officially admitted that the Colonial Office has been misinformed, and that the enemy numbers from 30,000 to 40,000 men. Convinced at last that we have to deal with no mere raid, but with a very substantial and formidable invasion, Lord Kimberley has sent out in hot haste a rocket battery and some marines. It is probable, however, that these reinforcements will arrive somewhat late, for by this time the rainy season has commenced and operations in the field must have perforce come to an end.

STARRING IN THE PULPIT.

ROWLAND HILL used to protest against the Devil having all the best tunes, and it seems to have occurred to Mr. Cowper-Temple that some of the expedients of a profane stage might profitably be transferred to ecclesiastical pulpits. Starring has been found to pay in the theatrical world, and it is suggested that it would also pay in the Church. However good the average clergyman may be in an ordinary way, yet, as he preaches Sunday after Sunday, his congregation at length get to be very familiar with his course of thought and pet phrases, and a change of style would perhaps be enlivening. There is no reason, however, that we know of why a clergyman of the Church of England should always occupy his own pulpit; and we are quite ready to admit that a more frequent interchange in this respect might not be without its advantages. Without reckoning up the statistics of the clergy, it may be assumed that there is a considerable range of selection within the Church open to any clergyman who is anxious to treat his congregation to a little fresh sermonizing. But this is not enough for the innovators. It seems that it is not so much variety of preacher as variety of doctrine that they are in want of. It can hardly be denied that there is a certain monotony about the Christian religion. It is always the same thing over again, and even a new preacher cannot give much freshness to old doctrines. After hearing all this old story of Christianity preached week after week, people, it is thought, would be glad of a change—almost, indeed, of anything for a change, even geography. Mr. Thomas Hughes is of opinion that it would really be worth while to go to church if you were sure of a good rousing sermon by Dr. Livingstone, describing his adventures in Central Africa, and clearing up the mystery of the Nile. Even latitudes and longitudes would be better than the Ten Commandments, and the Creeds, and all those things that we have heard of so often before. In the absence of Dr. Livingstone, perhaps Mr. Hughes would not object to an "occasional sermon" from Mr. Stanley, which would probably be more racy and amusing, though the latitudes and longitudes might be rather vague. But then Mr. Hughes should look forward a little. This Central Africa is rather a burning subject. If Dr. Livingstone and Mr. Stanley were once started in pulpits to argue their side of the question, we should have all the Geographical Society aspiring to a similar platform. We suppose the bishops, in the absence of any Privy Council decision, are entitled to regard the fountains of the Nile as an open question; and if Dr. Livingstone were to be allowed to preach his views one Sunday, it would be very hard on Mr. Galton, Mr. Cooley, and the rest of the "insane geographers," if they were to be refused permission to have a go in on the other side on succeeding Sundays. This would perhaps be a relief from the monotony of Christian doctrine, but we are not quite sure that the congregations would altogether relish it. It would be a novelty to have the Commandments covered over with maps of Africa, and to see the preacher illustrating his sermon with the aid of a long pole; but, after all, the geographers would probably be more at home in Savile Row.

It was proposed by the Occasional Sermons Bill that the right of preaching in the pulpits of the Church of England should be thrown open, not only to ministers of all denominations without exception, but to laymen. Mr. Cowper-Temple, as an inducement to pass his Bill, held out the prospect of "laymen of distinction, accustomed to impart teaching through the press and in other ways, on social, moral, and religious topics," giving their services as an occasional lift to the Church of England. He thought that this would be a great advantage both for the congregations and the clergymen, as "clergymen would benefit by hearing the views of gentlemen outside the clerical profession." It has been suggested that it gives an aspect of freshness even to a familiar landscape to put your head through your legs and look at it that way, and we can conceive that the benefit of this sort of freshness would be provided for clergymen of the Church of England who had the opportunity of hearing an "occasional sermon" from Mr. Bradlaugh about "the old monkey with the three tails." The dead level of orthodox doctrine would thus be agreeably varied. When Mr. Cowper-Temple suggested that laymen of distinction accustomed

to impart teaching through the press should be called in to preach to the clergy from their own pulpits, he was possibly thinking of those beautiful Good Friday articles in the *Daily Telegraph:* but we suspect that these productions are really adapted only for the closet. They are too moving for a public audience. It has been sometimes said that the press is supplanting the pulpit, but the pulpit must be even in a worse way than has been thought if it is to be saved only by getting the gentlemen of the press to recite their leading articles in the preacher's place. For our part, we think leading articles are very well in their way, but perhaps we have almost enough of them during the week. Mr. Matthew Arnold is a layman of distinction, and probably would draw well if announced to deliver a sermon on the three Shaftesburys. We see no reason to doubt that a great deal might be done in this way to enliven and render more popular and attractive the services of the Church; only, if the churches are to be turned into places of amusement, it seems hardly worth while to stop short at this point. A little freshness might be given to other parts of the service as well as to the preaching. An occasional operatic selection would be a pleasant relief from the monotony of sacred music, and a revival of the old miracle plays would introduce more direct competition with the theatres. If Dr. Livingstone is to be invited to preach on Africa, it would be only natural to have a course of sermons from Professor Tyndall on chemistry, with all sorts of pretty experiments on the altar; or from Dr. Darwin on the development of species, with illustrations from the Zoological Gardens in cages round the pulpit. There can be very little doubt that, regarded as a form of popular entertainment, the Church of England is not worked so successfully as it might be, and one can fancy what could be made of it if it were taken up in earnest by a regular showman like Cole C.B. or Mr. E. T. Smith.

The only difficulty in approving this proposal for making the Church lively and popular relates to the theory on which it rests of the object of the Church. If we could only admit that the Church had no other object than to make itself lively and popular, and to attract as large audiences as possible, we might be disposed to go in heartily with Mr. Cowper-Temple, and even somewhat beyond him. But we have always been under the impression that the Church was intended for something more than to provide the public with Sunday amusements. We had a notion that the object of the Church was to teach a particular set of doctrines, and though it is true that considerable latitude is allowed in the interpretation of those doctrines, still there are certain broad limits within which preachers must confine themselves. The preachers whom Mr. Cowper-Temple is anxious to admit to the pulpit would be under no sort of discipline or responsibility whatever. Once in the pulpit, they could say what they liked, and a clergyman loose in his belief, who was afraid to speak out his own sentiments, might find it convenient to have a stalking-horse of this kind. The Bill provided that before an occasional preacher was admitted to a pulpit he must be approved by the ordinary, the incumbent, and the churchwardens of the church in which he was to preach. Mr. Cowper-Temple apparently assumed that the ordinary was always the bishop, but that is not so. The bishop may or may not be the ordinary; and as Mr. Gladstone pointed out, ordinaries are in a great many instances men of whom public opinion knows very little, and over whom it consequently exercises very little check. A bishop is a person of high station and great responsibility, and might be trusted to be more careful what sort of people he licensed in this way. But even bishops are only men, and a resolute and teasing clergyman, who was very eager to adopt the starring system, would have many ways of bringing pressure to bear on the bishop of his diocese. It is a mistake to suppose that bishops are usually very strong in the back; on the contrary, that is just their weak point; they are anxious to please everybody as far as possible, and they would be apt to feel that an application from an incumbent and his churchwardens to authorize a clergyman of another denomination or a layman to preach would be difficult to resist. There is a sort of moral picketing to which ecclesiastical dignitaries are very much exposed, and under which they are really very helpless. Just because of their high position and great responsibility, bishops are very reluctant to do anything to disoblige their clergy; and if once the system of occasional sermons was fairly started, it would become rather an invidious task to withhold permission from any one to preach in the pulpit of an incumbent who was willing to cede it to him. In such a case the congregation may be considered to have some right to be heard, and the churchwardens were probably put forward as the protectors of the congregation. It was proposed that the churchwardens, as representatives of the congregation, should join the incumbent in applying to the bishop, and might, if they chose, refuse to do so. We suppose that the churchwardens before they assented to the application would feel bound to have a specimen of the candidate's style of preaching. There is a well-known story of a churchwarden who, when asked by the clergyman (Bishop Blomfield in his curate days) what he thought of his sermon against atheism replied apologetically, "Well you see, sir, I believes as how there be a God." But all churchwardens might not be equally discriminating or candid. Besides, they might be deceived by the candidate treating them at the private rehearsal to a page or two out of an orthodox book of sermons, and reserving his own spicy infidelity for the congregation. If a preacher took advantage of the incumbent and churchwardens in this way, the latter would probably be rather anxious to hush up the matter, and not have any public scandal about it. And thus the most extraordinary doctrines might be allowed to be put forth from the pulpit, apparently under the guarantee of the bishop, incumbent, and churchwardens, taking the churchwardens for what they are worth. Mr. Hughes says he is anxious to see the Church adapted to the requirements of the present state of society; and there are certainly at the present moment no lack of adapters. There are now before Parliament about a score of Bills dealing with the ecclesiastical reorganization of the Church; and if the adapters had their way, there would be some danger of its being adapted out of existence. Under Mr. Cowper-Temple's plan the Church would cease to have any distinctive doctrines, or any clergy in particular. All clergymen and all laymen of all denominations would be entitled to mount the pulpits of the Church, and to proclaim any doctrines they pleased. The Church, in fact, would become simply a series of open meeting-houses, like Exeter Hall, in which Monsignor Capel, Mr. Voysey, Mr. Bradlaugh, Mr. Spurgeon, and Mr. Matthew Arnold might be heard in lively succession. Mr. Cowper-Temple's anxiety to cut down Christianity to "the points on which all Christians are agreed" reminds one of a well-known writer who boasted that he was a Christian of the time of Christ. It was suggested that this must have been a Christian who had listened with approval to the Sermon on the Mount, but had never happened to hear of the miracles and died before the Resurrection. Mr. Cowper-Temple is not so fastidious as to stickle for even those points about which all Christians are agreed. He suggests no sort of restrictions as to the doctrines which his preachers of occasional sermons may enunciate. It is obvious that under a process of this sort the Church would at once lose its reason for existence and would be rapidly broken down. A Church which represented nothing but a common platform open to every preacher and spouter would certainly be something very different from what is now known as the Church of England. Happily the temper of the times is running strongly against these fussy, meddlesome, crotchety projects of legislation, and Mr. Cowper-Temple's preposterous Bill has been rejected in so decisive a manner that we may almost hope never to hear of it again.

THE LAW OF GAMES.

A BOOK has been lately published giving a brief history of lotteries in England, and it may be worth while to remark that, when one great opportunity for gambling was removed by the abolition of State lotteries, it was natural that other opportunities should be invented or improved. This observation may perhaps account for the great extension of betting upon horse-races during the last forty years. The Derby is at any rate preferable to an annual State lottery organized on a scale proportioned to the wealth and speculative spirit of the nation. We may estimate what would be done now by looking back to what was done in 1826 in preparation for the drawing of the last State lottery in October of that year. The name of the enterprising contractor, Bish, still lingers in the memory of many persons through his poetical advertisements:—

'Tis Bish's house, I know it well,
'Tis there you get a golden pill.

The earnest invitations to men, women, and children to make their fortunes by the help of Bish may remind us that there are several persons prepared at any moment to reveal for a small consideration the name of an outsider who is certain to win a great race. The art and mystery of puffing has not perished, as Charles Lamb feared it would, along with lotteries. But perhaps there has been little improvement upon the ingenuity of Bish and other lottery contractors. "They cajoled and decoyed the most suspicious and wary reader into a perusal of their advertisements by devices of endless variety and cunning. They baited their lurking schemes with midnight murders, ghost stories, crim. cons., bons-mots, balloons, dreadful catastrophes, and every diversity of joy and sorrow to catch newspaper gudgeons." Besides encouraging talent which Charles Lamb thought admirable, the State lottery added upwards of a quarter of a million to the revenue of the year. It gave employment to others besides puffers. There is a tradition that a well-known jockey used to disappear from Newmarket at intervals during the winter months, and he was supposed to be employed in riding with relays of horses from Liverpool to London to announce the numbers of the tickets which had been drawn as prizes in the Irish lotteries. Many precautions were adopted to ensure fairness in the drawing. King Charles II. informed his subjects that he would himself see all the prizes put in amongst the blanks, and at the same time Mr. Francis Child of Temple Bar undertook to be responsible to the adventurers for the delivery of the prizes. This division of labour between the sovereign and the banker is amusing. The King would undertake for his own honesty, but not for the solvency of himself or anybody else. This lottery was held for the disposal of the jewels of Prince Rupert, then lately deceased, which were valued at 20,000*l.* When the State went regularly into the business of lotteries, it endeavoured to suppress the private lotteries or "little goes" of individual speculators, who however operated to a great extent, and with every species of fraudulent contrivance. It became the custom to employ boys of the Bluecoat School to draw the tickets of the State lotteries, and an order was issued by the Treasury that the managers should see that "the broom and

sleeves of his coat be closely buttoned, and his pockets sewed up," and other precautions be taken to render cheating impossible. Poor medical practitioners used to attend the drawings of public lotteries to be ready to assist persons who might be overpowered by emotion on hearing the fate of the tickets which they held. Charles Lamb has described the happiness of a gentleman who, by a mistake of a lottery office, enjoyed for ten minutes the pleasure of possessing 20,000*l.* The literature of the age derived a special flavour from this source. It was thought a good joke to announce that "six fair pretty young ladies imported from Europe" would be raffled for at Calcutta, and we almost wonder that this advertisement did not produce a cynical essay upon the advantages of a blank in the lottery of matrimony. There must have been a few persons who made fortunes in lotteries and kept them, and there must have been persons innumerable who habitually took tickets in lotteries just as there are persons who always make a small "investment," as they call it, upon the Derby. It is, however, something gained that the law does not allow betting agents to advertise themselves as openly as did the great Bish. Something like the national infatuation which prevailed in the age of lotteries has been produced locally in recent times in reference to horse-racing. We are reminded by the death of the venerable Earl of Zetland that Yorkshire went mad when "the spots" won the Derby; and although the late Earl's influence in Richmond procured the return of the present Lord Chancellor for that borough, yet this trivial circumstance will be forgotten, while it will be remembered that Lord Zetland was an excellent judge of horseflesh, and the master of a small but well selected stud, which included Voltigeur and Vedette. The Earl of Zetland belonged to a class of sportsmen of whom there are too few left on the Turf, and indeed it has now reached a condition like that of lotteries under King Charles II., when the public needed some special assurance that things would be done upon the square. The belief of Yorkshiremen in their favourite "spots" was founded on the honour as well as shrewdness which governed the Aske stable. As we cannot expect the English nation to abstain from gambling, it is something to have substituted horse-races, even as they are now conducted, for lotteries.

These remarks have been suggested by a little book on Games, by Mr. F. Brandt, which brings out more clearly than any other book which we remember that the prohibitions of various early statutes were directed against games, not as in themselves wrong, but as tending to divert attention from archery and other warlike exercises. Thus the stat. 33, Hen. VIII. c. 9, which was passed upon the petition of bowmen and others concerned in making implements of archery, enacts that no manner of artificer, craftsman, labourer, or servant, should play at tables, tennis, dice, cards, bowls, or any other unlawful game out of Christmas under pain of 20*s.* According to the idea of that time, the King and nobility might do that which was forbidden to the common people, and the Royal palaces and the houses of great men had special privileges for gambling. For many generations certain apartments of the Royal palace offered facilities to lords and ladies to lose their money, and in the comedies of the eighteenth century play at the Groom Porter's is mentioned as betting at Tattersall's might be in comedies were written nowadays. This "good and profitable statute" of King Henry VIII. would certainly have prohibited cricket if that game had been invented in his time. It was not merely playing for money, but playing simply, that was forbidden, and doubtless boat-racing would have been censured along with other "vanos ludos" as distracting the mind of youth from archery. The ladies of the period were doubtless expected to look on at archery with as much interest as at bowls or tennis; and indeed archery must have been almost as amusing to the uninitiated spectator as particularly scientific cricket, involving a frequent occurrence of "maiden overs." It might be an interesting question how far the statute of Henry VIII. was observed. That it had considerable effect may be inferred from the declaration of King James I. that certain games should be lawful upon Sundays or holidays after divine service was ended. Thus the exemption which had been allowed to Christmas was extended to other festivals. The Sabbatarian view of these matters only established itself at a later time. The general view of our law was that the better the day the better the deed; and King Charles I. added a further exemption of the wakes, or feasts of the dedication of churches, which are said to have been always kept in the North of England, and which lately, under another influence, have been revived. It was in preparation for one of these wakes that the churchwardens of a certain parish were said to have sold their church Bible to buy a bear. It may perhaps mitigate our compassion for the subjects of King Henry VIII. to observe that they could always relieve the dulness of a life bereft of games by fighting among themselves, either with weapons or without. Hamlet contemplates that the bones of a dead man might be used to play at loggats, which were a kind of skittles; and there were other and more exciting games in which the bones of a living man might be used without contravening the letter of the law, and certainly in harmony with its spirit. It seems wonderful that the Act of King Henry VIII. should have remained unrepealed until 1845. But up to that time it was illegal for any person to play at bowls, quoits, or tennis in a public ground, and it was also illegal for working-men to play at these games anywhere at any time except Christmas. It is pleasant to think that under the law as it stood less than thirty years ago a party of working colliers could only amuse themselves with skittles by permission of their master. This was the more hard because the advancing civilization of the age was beginning to oppose itself to fighting even with fists, while cudgels and quarter-staff were growing obsolete, and bull and bear baiting and sword-play had gone wholly out of fashion. It might of course be suggested that the colliers could go to a Mechanics' Institute and hear a lecture, but an artist of *Punch* knew their habits better when he represented the mother of a family exhorting her eldest son to "get'ee foughten and come whoam," adding that "faythur's gotten foughten an hour a-gone." There can be no doubt that bowls, skittles, or loggats, have always been popular games in England, as is proved by the saying, which has become almost a proverb, that life is not all beer and skittles. We must suppose, therefore, that the statute against these games was systematically disregarded. The working-man got his skittles and would be likely to get his beer in spite of prohibitory laws. In like manner the statute of King Charles II. against betting on credit beyond 100*l.* did not usually interfere with the transactions of the Turf; but the penalties imposed by that statute were sometimes sued for by informers, and indeed it was an action of this kind that induced the Legislature to consider the whole subject, and frame the statute by which such matters are now regulated. Both the law and the administration of it have lately become sufficiently severe. It is true that betting upon horse-races has not been, and is not likely to be, abolished, and we may be sure that, if it were, some other form of gambling would take its place. It appears from Mr. Brandt's book that no longer ago than 1825 the owner of a travelling menagerie advertised a match for a fabulous amount between a lion and dogs. The Special Correspondent had not at that day obtained the importance which he now enjoys, but the reporters of the daily newspapers did their best to describe the details of the combat, at the same time expressing their disgust at it. The *Morning Herald*, with a discernment that entitled it to the name it afterwards acquired, had declared its conviction that there was no such person as the maker of this match, and that the match would never come off, but was a mere contrivance to induce the public to pay money to see the lion and the dogs. These extracts have become by lapse of time almost as curious as the *Spectator's* description of sword-play at Hockley-in-the-Hole, which is also quoted by Mr. Brandt. This sword-play was a genuine affair, but it appears from another extract that what is called a "cross" was practised by fighting men in Queen Anne's time. Looking at the whole course of legislation, it is not wonderful that a bench of magistrates should have adjourned their proceedings to attend the great fight between Cribb and Molyneux. The law disapproved loggatting in the fields, and would have equally disapproved the pitch and toss of modern times; but a fair stand-up fight with fists or cudgels, or even swords and bucklers, was within the spirit of the statute for "the maintenance of artillery." Indeed King Henry VIII. made the professors of the "Noble Science of Defence" into a corporation which held exercises and granted degrees. Perhaps we might epitomize the legislation of that King's time by saying that unlawful games were those which tended to the loss of money rather than of blood.

THE ROYAL ACADEMY.

III.

"THE ideal in art" is almost unknown within our modern picture galleries, and yet from time to time there appears an exceptional work, such as Mr. Leighton's design, "The Industrial Arts of Peace" (1270), which affords pleasant proof that the prevailing realism of the period is giving way to styles more abstract and generic. The idea or idealism in this composition is in part seen in the unity and simplicity educed from component elements which are varied and complex. The centre of the canvas is held by a bevy of fair women who have nothing more "industrial" on hand than the milliner's art; one and all are studiously occupied in developing their natural charms by the aid of artificial draperies. This by no means profound motive gives opportunity for the manifestation of supreme grace; such movement as is here needed is but one remove from rest; indeed the beauty which resides in repose is not in this middle portion of the composition broken at a single point. The remaining two-third parts—one on either hand—are surrendered to the business and the bustle of the world. On the left appear upon the scene men sinewy as if drawn by Signorelli, bearing products of the vintage across the quay; on the opposite side are figures to match concerned with the classic drama, and at work on Greek vases. It will thus be observed that the "industrial" element, which appears in the printed title, has been all but left out, probably to the advantage of the picture. Everything, in fact, has been omitted which could by possibility mar the symmetry and concord of this symphony of sweet forms. The composition is all the more compactly knit together by a semicircular colonnade, which forms a background to the figures after the manner of the Italian masters, who reduced mural painting to a system; and thus the design which is intended as "part of a projected decoration in the South Kensington Museum" observes the laws and conforms to the proportions of "monumental art." A work of this imaginative character is scarcely restricted within the categories of time and space; accordingly, the locality has been left to conjecture, yet the presence of the palm pleasantly suggests a Southern land where life is surrendered to luxury and sweetened by *dolce far niente*. In like manner as to date, fancy is permitted in agreeable freedom to wander pretty

much where it listeth; but at all events the presence of one of the latest forms of Greek vases prohibits the possibility of so early a period as the age of Pericles. Of much more vital moment are questions which involve style and treatment; and herein we at first inclined to think that the artist had surrendered too much to unity, that he had interwoven his lines and cast his harmonies into such intricate involutions as to lose breadth and decision. It is not the first time that the painter has barely escaped these penalties of an over-subtle and sensitive style. In the present instance, however, a struggle has evidently been made to preserve breadth in detail and simplicity in the midst of complexity. The work, judged by historic standards, is eclectic, and yet not quite in the Bolognese sense, because modern eclecticism comes down later and comprises more. Thus in this elegant combination we seem to pass from the ancient Greeks to the middle-age Italians, down even to the time of our English Flaxman or Stothard. Did space permit, it might be interesting to criticize the composition in its relation to the sister arts of written poetry and of musical sound. Though strictly pictorial, and in parts almost plastic, it is yet rhythmical as verse and melodious as music.

The term "ideal," with which we began this notice, finds further illustration within the Academy of the year. Thus for the sake of ideal beauty, as opposed to realistic strength, some people may incline to pardon "The Lady of Shalott" (949), a characteristic fantasy of Mr. Arthur Hughes. A composition comprising a lady lying in a boat attended by a swan, and gazed at curiously by villagers peering from out a woodland, is so much a matter of routine that the conception can only be redeemed by treatment. In the present case colour has to excuse the absence of form, and a certain refinement of sentiment must serve as a substitute for robuster qualities. Mr. Fildes, in a picture of "Simpletons" (960), hung as a companion to "The Lady of Shalott" has degenerated into frivolity; this is a sad falling off from the work we had the pleasure of commending a year ago; yet the motive is not dissimilar; in fact, the artist but pays the proverbial penalty of attempting a sequel to a success. Reverting to ideals, we naturally come to "The Fountain" (72); here a driblet of water enables Mr. Leslie, A.R.A., to bring together a company of graceful girls in semi-classic draperies, with headwreaths of live flowers culled from the neighbouring woods. The fatality which almost invariably attends ideal schools here begins to make itself felt; nature retreats still further from the scene, and forms which at first were pleasing shadows fade into the pale land of visions. The ideal of Mr. Leslie is romantic; that of Mr. Albert Moore, in "Follow my Leader" (149), assumes a more classic guise. Mr. Leslie as usual poses his female figures in rest; his attitudes are often reflected from Greek vases. Mr. Moore also may be indebted to fictile vases, only he prefers compositions wherein figures in a long line are giving each other chase, one leg foremost, the other lagging behind. Mr. Leslie is pretty, Mr. Moore little else than peculiar. It is a misfortune when a gifted artist whose chosen mission is that of a revivalist selects for reproduction types which belong to periods of decadence. Mr. Moore, unlike Flaxman in England, and Carstens in Germany, resuscitates forms which are less graceful than uncouth, and his draperies especially become objectionable when, as here, they pertain to the corrupt Roman style more than to the prior and the purer Grecian period. We think, too, that Mr. Moore falls into errors of colour analogous to his faults in form; his pigments have a crudity and opacity which he has too blindly borrowed from the mural paintings of Pompeii—a school of art avowedly provincial, and, as compared with the highest classic manifestations, little above the rank of paper-hangings. The line taken by Mr. Moore is so full of promise, so capable of high and indefinite development, that we feel all the more intolerant when he falls short of his noble aim. A figure of much classic grace, "Watching the Game" (394), by Miss A. M. Thornycroft, does not fall under the censure to which these classic revivals are frequently subject; refinement, beauty, and harmony of composition distinguish this praiseworthy effort. Another young lady, Miss A. E. Donkin, has won her way to a place on the line by a thoughtful and well-painted head, "Musical Memories" (130).

It is curious to observe how ideal standards change from time to time within the Academy, how types once new have become, by common use, stale, conventional, and worn out. The figures served up year after year by Mr. Frith, R.A., may possibly, in the eyes of some, still pass for the pink of perfection; but they have appeared so often, not only at "The Winning Hazard" (221), and among "English Archers" (99), but also at gambling-tables and race-courses, that their further presence may well be spared. A painter is worthy of respect when he throws into his work some fresh thought, but when he no longer strives to surpass himself, he will find to his cost that he cannot remain where he is, but must go backwards. Mr. Frith's brush has scarcely a rival, save in Paris, for sparkle and dexterity, but the mischief is that the ideas embodied are poor in the scale of intellect. Mr. Horsley, R.A., has also been accustomed to repeat himself; "Stolen Glances" (202) is a story of love, with a window intervening between the cavaliers and the ladies; the only original character appears to be a cat sitting without blinking, as wise as an owl and as grave as a judge. The story, though trite, has the merit of being told, as may be expected, with sly and quiet humour. Mr. Calderon, though his manner has been for some time sufficiently settled to be told at a glance, is fortunate enough to find with each recurring season a fresh crop of new ideas, and if on the present occasion his conceptions are not of an importance to require a large canvas, they are commended by point, wit, and *esprit faire*. Of accustomed vivacity is "Victory" (215); from the high battlement of a walled city women and children, gathered into eager groups, look down on the plain below, where fathers, husbands, brothers, sons, are in fierce combat with the foe; hope and fear pass from face to face under the changing fortunes of the field. The subject involved palpable difficulties which could be surmounted only by skilful composition and by a clear and trenchant delineation of character. We pass by, as a useful sort of potboiler, an intensely sentimental situation on a garden beach, "Take, O take, those lips away" (126). Much to be preferred is a love comedy by the same artist, "The Moonlight Serenade" (181). A lady looks from a window; beneath is the enraged father or husband with sword in hand in hot pursuit; the lover in his retreat has strewn the pavement with flowers, a guitar, and a shoe; already far away round a sharp corner he presents to the spectator nothing but his affrighted back. It is always a good sign when a picture translates well into words; a narrative on canvas seldom fails to please when it reads perspicuously as a tale in a book; indeed the most popular works in the Academy are usually story pictures, as may be seen by the eager eyes that gather round them. There seems, indeed, a danger at the present time that incident may usurp the place of higher and more directly art qualities. Pictorial narratives are like picture story-books suited to the capacity of children.

Writers on the philosophy of art such as M. Taine sometimes give so extended an interpretation to the "ideal" as to include within the term every ruling "idea," whatever aspect it may assume. The exhibition of the Academy would thus seem to be divided into two parts—(1st) pictures with an idea, and (2nd) pictures without an idea. We are glad to say that the latter—the idealess pictures—are year by year diminishing in number. Many examples might be adduced of works which in different directions show that artists are more careful than hitherto to subject the accidents of nature to governing law. We are willing to think that Mr. Marcus Stone, in "Le Roi est mort; Vive le Roi!" (663), has taken a more serious view than heretofore of the exigencies of history. At all events the subject is conceived dramatically and expressed with sufficient breadth. On the one hand, the dead king lies on his bed convulsively just as he has died; forthwith the officers of State turn away and throw themselves at the feet of the infant king supported by his mother. Mr. Stone has long given a promise of which we here see the fulfilment; his compositions, clever even to excess, have often wanted governing purpose. We may next mention "Pompeii Destroyed" (550), by Mr. Topham, in proof of how widely a lurid fancy goes astray when unrestrained by truth. The composition is not without beauty and dramatic power, and yet, instead of a grave historic event, we have here an incoherent concourse of figures which have little more to do with Pompeii than if they were a gipsy encampment. Specially nomadic, festive, and ill-timed is the tent scene, wherein a young girl vain of her charms arranges her toilet before a mirror held up by a domestic slave. This clever artist again fails, as heretofore, because he does not settle with sufficient forethought his pictorial plan; in consequence his brilliant technique is thrown away. With greater solemnity and with more stately step Sir John Gilbert marches across the field of history; "The First Prince of Wales" (593) is a composition which gains power in proportion to its concentration. The infant prince fitly forms the focus around which encircling figures congregate; specially noble are the Druid-like representatives of the ancient Britons. The execution is strong as the conception is manly and heroic. "The ideal in art," as defined by M. Taine and others, would seem to include even such painters as Sir John Gilbert and Rembrandt; a teaching thus tolerant gives to the future of our English school all the more hope inasmuch as the most real of the real is not beyond the pale of the ideal.

NEWMARKET SECOND SPRING MEETING.

As we shall have to refer to the Two Thousand week in order to obtain some idea of the form of the two-year olds, so far as it has been exhibited up to the present time, we may take the opportunity to say a word on the One Thousand Guineas and Newmarket Stakes, on which we had no opportunity of commenting before. The former race was run this year for the first time on the Rowley instead of the Ditch mile, but the alteration of the course had no effect in preventing its result from being, as usual, a surprise, owing to the uncertain disposition of fillies at this season of the year. The field was larger than for the Two Thousand, and the fourteen starters included nearly all prominent performers of last year, except Cantinière and Lady Lyon. Mr. Merry was represented by Marie Stuart, Lord Falmouth ran two, Silver Ring and Cecilia, Count Renard and M. Lefèvre started a pair each, and the best known of the remainder were Angela, Gratinska, Windermere, Wild Myrtle, and Blue Light. An excellent start was the prelude to an excellent race, in which all public form was upset, and Cecilia, who ran five times last year without success, not only made the whole running, but won cleverly from Angela, Windermere, and Marie Stuart, these three finishing close together. Angela's previous performances were good enough to entitle her on her merits to a place; but Marie Stuart and Gratinska sadly fell off from their best form, and Silver Ring also must have deteriorated or be at present in no condition to run since she finished so far behind her stable

companion. Cecilia is a daughter of Siberia, who herself won the One Thousand, which race has now fallen twice to Lord Falmouth. Later in the same afternoon Lord Falmouth followed up his success by carrying off the Newmarket Stakes with Andred, who beat Negro much more easily than he was beaten himself in the Craven week by M. Lefèvre's horse. The Ditch mile is possibly not suited so well to Negro as the Rowley mile; but when horses cannot get away from one another, and alternately beat and are beaten, it is plain proof that they are none of them of the highest class; and that, we suspect, will turn out to be the real truth about the three-year-olds in 1873.

The first day of the two-year-old racing showed that French owners have not lost the secret, even with English-bred and English-trained horses, of bringing their youngsters to the post in a state of precocious forwardness which is the wonder of ordinary trainers. M. Lefèvre and Fordham were irresistible, and La Jeunesse, Miss Toto, and La Gelée swept off the three first two-year-old prizes of the year. The first is by Thormanby out of Sunset, and the second by Lord Clifden out of Baroness, and already public running has shown Miss Toto to be about the best at present exhibited. But each of the three who succeeded in carrying off their earliest engagements beat horses that in the fortnight that has since elapsed have been returned as winners. The oddly named Mr. Winkle, for instance, by St. Albans out of Peri, who was beaten a long way off by Miss Toto at Newmarket, won two races at Chester, where Juliet in like manner vanquished by La Jeunesse at the First Spring Meeting, also gained a victory. Mr. Winkle also won his first engagement at Newmarket this week, though, being brought out again one hour afterwards, and having to carry a 5 lb. penalty in the principal race of the week, he was exposed to an almost certain defeat. For this, the Newmarket Two-Year-Old Plate, nineteen ran, and two stable companions, Tomahawk and Couronne de Fer, finished first and second, while Napoleon III. was an indifferent third. Now Tomahawk and Napoleon III. were both beaten by Miss Toto at the First Spring Meeting, and Couronne de Fer was considered by his trainer superior to Tomahawk. Therefore we are justified in holding that the form of Miss Toto has not been at present surpassed. But Couronne de Fer, by Macaroni out of Miss Agnes, ran so gamely on Tuesday, and made up so much lost ground at the finish, that we can readily believe he will turn out the best stayer of the nineteen, and, possibly, one of the champions of his year. Mr. Winkle, we may add, has not many engagements, and as he was much distressed after his second race on Tuesday, little can be expected from him. We shall possibly see Tomahawk again at Epsom in the Woodcote Stakes, but Couronne de Fer has no engagement till Ascot.

Prince Charlie and Vulcan met for the second time this season on Tuesday, over the last five furlongs of the Rowley mile, and Chopette joined in with them; but Prince Charlie made a fearful example of his opponents, and won far more easily than in the Craven week. Any animal that succeeds in getting anywhere near the magnificent son of Blair Athol at weight for age, over a six-furlong course, will be little short of a wonder. The Newmarket Spring Handicap on Wednesday was won by Blenheim, who, though not favoured in the weights, was of better class than his eight antagonists. The Gang Forward Stakes fell to Stonan, the property of Gang Forward's owner, who won cleverly from a good field, including Oxford Mixture, Drummond, and Croxteth; and having also carried off a good race at Epsom Spring Meeting, he considerably improved the position of his stable companion as a Derby favourite. But by far the most important race of the day was the Derby Trial Plate, over the last mile and a half of the Beacon course, for which eight started, among whom we need only mention Laburnum, Thorn, and Bertram. We need hardly say that the weights were weights for age, and that the race answered with some reality to its high-sounding name. Laburnum (who, as we expected, proved utterly ignorant of the merry-go-round business of the Chester Course) had evidently retained a lively recollection of his unprofitable journey from Newmarket to the banks of the Dee, and, being forced against his will to make the running, very soon gave up the struggle in disgust. The race then resolved itself into a match between Thorn and Bertram, and after a very fine finish the former succeeded in winning by a head. This performance served to point out especially the sterling merits of Kaiser, who beat Thorn easily in the Champagne Stakes at Doncaster. And that Thorn was in good form at the time was proved by his hollow victory on the following day over a fairly speedy field. Bertram also is an excellent trial horse, and the supporters of Kaiser for the Derby must be in every way satisfied with the result of the Derby Trial Plate. We are glad to be able to say that the fields at the Second Spring Meeting were, as a rule, large, and certainly much in excess of the usual average of starters at Newmarket. This improvement was not noticeable only in the two-year-old races, but in the weight for age races also and the smaller events. But then we must remember that there is no more racing after this week at Newmarket till July, and owners and trainers may have become fairly sick of keeping long strings of horses in idleness. There was nothing, after all, wonderful about the size of the fields, considering the immense number of horses that are trained at Newmarket; but when, at an ordinary meeting, two or three only are, on an average, gathered together to take part in a race, one is thankful that occasionally the number of starters is increased to six, or eight, or ten.

A short debate which has taken place in the House of Commons within the last fortnight, on the policy of applying public money to the maintenance of Queen's Plates in Scotland and Ireland is deserving of notice, because the minority which declines to sanction the grant is steadily growing in numbers and importance, because the discussion is sure to be renewed when a similar vote is taken for England, and because it is to be hoped that some stronger arguments than have hitherto been used in their favour will then be forthcoming. Nothing could possibly have been weaker than Lord Hartington's defence of Queen's Plates, which consisted, in fact, of two complacent and confident statements—first, that racing tended to improve the breed of horses, and secondly, that any sums given by the nation to encourage racing could not be better appropriated than they are now. There is no subject on which opinions are so much divided as the question whether the modern system of racing does or does not conduce to the improvement of the thoroughbred; and Lord Hartington's calm assertion is merely the expression of his individual sympathy with the views of that section of racing men which acknowledges Admiral Rous as its leader. It is convenient to ignore the fact that the opposite party, which, so far from believing in the progressive improvement of the British thoroughbred, suspects its deterioration, is strong in numbers and influence, though perhaps not so noisy in argument. But, granting for the moment the first position assumed by the Chief Secretary for Ireland, is there any warrant, even in the opinion of any one party of lovers of the Turf, for his second? Is it not a fact that Queen's Plates were established at a time when it was the fashion to race long distance races—very often in heats also—and when horses were bred and trained expressly for that purpose? Is it not a fact that that time has gone by, that the fashion is obsolete, and that modern racehorses are bred and trained for very different purposes? Can it be denied that the Queen's Plate is the proverbial farce of the meeting to which it is granted, that no owner of horses at the present day cares a button about the one hundred guineas—seeing that he could win five times as much by his horse coming in last instead of first—and that very few horses at the present day care about galloping four, or three, or even two miles and a half? No one who has been in the habit of attending race meetings during the last few years can rebut these inquiries. Often enough there is a literal and actual walk over for the Queen's Plate; but where there is a race, what a ghost and shadow of a race it is! Starting at a walk, that steady but not trying pace is maintained for perhaps a fourth of the distance, when it occurs to some ambitious jockey that trotting on a summer afternoon is an agreeable exercise. Warmed by the enjoyment of a trot, he changes at length to a canter, and his professional instincts arouse him to set his horse galloping in the last half-mile, when the stand is in sight, and the roar of the bookmakers is within hearing. And then the winner of such a race is heralded as a grand stayer, and a Cabinet Minister pronounces that the public money is well spent in the maintenance of these paltry burlesques. We do not say for a moment that it is unadvisable to support racing by grants of public money. The time may perhaps not be far distant when such support must be withheld; but at present the sport has not sunk to that depth of degradation which would compel the withdrawal of the national sanction. But we do say two things—first, that if Queen's Plates are retained under a belief that they will encourage a breed of horses qualified to run over long courses at fair racing pace, that belief is utterly fallacious; and, secondly, that if the public bounty is to be continued, the conditions of its bestowal require immediate and thorough attention. If our memory serves us, about three thousand pounds are given in England alone for Queen's Plates; and the amount so given is, by the method of its distribution, practically thrown away. If one thousand pounds were given to a two-year-old race in October, over the Bretby Stakes course, another thousand to a three-year-old race for colts and fillies, to be run between Ascot and Doncaster over a mile and a half course, and the third to a Cup race for horses of all ages over a two-mile course, more encouragement would be given than by the establishment of five hundred Queen's Plates. We fear, however, that the fact is that Queen's Plates are allowed to remain from that spirit of conservatism which is loth to uproot existing institutions, but that any attempt to remodel or extend the support extended by Parliament to racing would be met by an outspoken declaration that racing was not worthy of any national recognition whatsoever. We may patch up an old house as well as we can; but if we are asked to rebuild it, we not unfrequently obliterate some of its original features.

By the death of Lord Zetland, the Turf has lost one of its most honourable and most consistent supporters, and a very powerful bulwark against the storm of opposition that will before long assail it. In old age as in youth Lord Zetland was a lover of racehorses, and delighted to see them display their merits in fair contest. He had a natural ambition to carry off the highest prizes of racing, but he disdained to secure them by the ignoble method of buying up his most dangerous antagonists. When he had a good horse, of his own breeding, and home-trained, all that could be done with him was done; but he never troubled to attend, in person or by deputy, fashionable yearling sales, or to give absurd prices for strains of blood that might happen to be in vogue. With Voltigeur he carried off the Derby and St. Leger, and, proudest triumph of all, snatched the Doncaster Cup from the mighty Flying Dutchman. The sequel of that victory will be never forgotten; but the Voltigeur of 1851 was very different from him of 1850; and over-training and over-carefulness made him an easy victim to Lord Eglinton's horse in the great match at

York, in which all England was interested. Never afterwards did Lord Zetland own a Derby winner; though Vedette, who carried off the Two Thousand under every possible disadvantage, would have had few behind him at Epsom had he been entered in the great race of the year. But he won a fair share of prizes—quite sufficient to prevent him from throwing up his stud in disgust; and, in addition, he did not enter his yearlings at haphazard in all great events, in the hope that one out of many might represent him creditably in the end. In his own county no one so liberally patronized race meetings; but after his solitary Derby victory he was comparatively indifferent to South country gatherings. Still he was faithful to the old-established weight for age races at Newmarket and Ascot, and Fragrance and King Cole, Khedive and King Lud, have kept his name and his colours in the recollection of the latest race-goers. He could not give up the idea of a Derby winner, and one that had beaten the greatest horse of modern times, being sure to beget an equal to himself in time; but Voltigeur has never fulfilled this expectation. What he has imparted to his progeny has been his temper, which became, in his own case, affected after his two trying races in the autumn of 1850, and which time made worse ever afterwards. None of his stock has come near him in staying powers, but it may be a satisfaction to remark that his mighty rival has been still more unsuccessful at the stud. Horse-breeding—despite the plausible attempts to elevate it to the dignity of a science—is more a lottery than horse-racing; and, to all appearances, we shall live to see the great Gladiateur widely known as a sire of platers. It is uncertain as yet whether the Zetland stud will be dispersed or not; but, whatever its fate, the white and red spots jacket will long remain a cherished memory to the horse-loving inhabitants of Yorkshire.

REVIEWS.

THE YELLOWSTONE BASIN.*

In our notice of the United States Geological Survey of Nebraska and Montana we drew attention some months ago to the singular and strongly marked physical features which make the valley of the Yellowstone River in the last-named Territory one of the most remarkable in the world. Nowhere are the evidences of volcanic activity in bygone geological times exhibited on so stupendous a scale, or crowded into so definite a focus. During the Pleiocene period, as depicted by Dr. Hayden, the able geologist of the survey, the whole vast country now drained by the Yellowstone and the Columbia Rivers was the theatre of a mighty drama played by igneous forces imprisoned within the earth. It might be described as one vast crater made up out of a thousand smaller volcanic vents and fissures, out of which the fluid interior of the earth, fragments of rock and volcanic dust, were poured forth in unlimited volume. Hundreds of the nuclei or cones of these volcanic vents are still remaining, some of them rising to a height of 10,000 feet or more above the sea. All that is left of those gigantic forces which threw up these lofty mountains and raised the whole region to its present altitude now finds issue in occasional earthquake shocks, and in the innumerable hot springs and geysers which dwarf those of Iceland and New Zealand into insignificance. These wonders culminate in the Yellowstone Lake, which, with the district adjoining, has been, by the wise and liberal policy of the national Legislature, set apart like the Yosemite Valley in California as a national park to be kept in perpetuity, sacred from the promiscuous intrusion and vulgar desecration which have so sadly marred the beauties of Niagara. For a popular account of this unique and little known district, compiled for Mr. Bayard Taylor's "Illustrated Library of Travel, Exploration, and Adventure" from the best and latest official reports, coupled with the personal narrative of the ex-governor of Montana, N. P. Langford, the public will thank the writer of the little volume before us, albeit we fail to gather that he speaks from his own knowledge of the wonders which he has to tell.

Situated at a height of 7,427 feet above the sea, having no rival in elevation save Lake Titicaca in South America, the Yellowstone Lake, justly called the crown of the continent, receives no tributaries of any size or volume, its clear cold water being contributed only by the snows which lie thickly upon the mountain ranges which hem it in on every side. In colour a bright emerald green, shading to a delicate ultramarine, recalling the varied hues which form the more familiar beauty of the Lake of Thun, this lake has its shore paved with volcanic rocks, here in great masses, there broken into pebbles of trachyte, obsidian, chalcedony, cornelian, agate, and fragments of agatized wood; in some places ground to obsidian sand, and sprinkled with crystals of Californian diamonds. Vegetation is abundant in its waters, which swarm with salmon trout; no other fish, nor yet mollusca, inhabiting its waters. Waterfowl, however, are abundant and varied; while herds of deer, elk, and mountain sheep throng the forests and mountains around the lake. Nor are grizzly bears, buffaloes, and California lions uncommon; whilst the smaller lakes and creek valleys are fairly alive with otter, beaver, mink, and musk rats. New species of squirrels and weasels are met with, but happily no snakes; though rattlesnakes are plentiful enough down the Yellowstone river. This lovely sheet of water is somewhat over twenty miles long and fifteen broad, of irregular shape, compared to an outspread hand. A few islands, thickly clad with pines, dot its surface; and in the illustration, expressively if not over-delicately drawn, woods of pine fringe and diversify its shores. The river of the same name leaves the lake with an easy flow northwards, a quarter of a mile wide, just deep enough to swim a horse. Three or four miles from the lake Sulphur Hills stand as monuments of a once magnificent system of boiling springs, the deposit of which, a large white mass of silica, covering the mountain-side, looks from the lake like a huge bank of snow. Along the valley below hot springs are scattered for miles, their temperature reaching 160°, depositing oxide of iron, sulphur, and silica, in the most beautifully blended colours. The mass of hot-spring material built up at the bottom of the valley is set down as at not less than 400 feet in thickness, a large portion of it pudding-stone or conglomerate. Enclosed in the fine white siliceous cement are globes of pure white silica, eight inches in diameter. A valuable lesson in geology is here to be learnt from operations in nature going on in the face of day. The abundant vegetation which fills the valley—mosses and other plants growing in dense masses up to the verge of the channel—attest no less instructively the effects of the subterranean heat in fertilizing the soil. At the north-eastern corner of the lake a long low spit of land has been built out into its bed by ancient geyser action, the force of which is betokened still by a few roaring steam vents, giving their name to the point. The hot-spring area here is four or five miles long by two wide, the ground being in many places perforated like a cullender with simmering vents, which deposit sulphur, alum, and common salt, and stain the surface with oxide of iron. The eastern rim of Yellowstone Basin is formed by one of the grandest volcanic ranges in the world, the summits rising on an average 10,000 feet above the sea, and not a few considerably higher. From one of the highest peaks Mr. Langford and Lieutenant Doane gazed upon a scene which beggared description. The lake and valley surrounding it lay at their feet, seemingly within "jumping distance." Beyond them were seen in the distance the jets of the grand geysers and mud volcanoes of the Yellowstone. But beyond all these, stretching away into an horizon of cloud-defined mountains, lay the entire Wind River range, revealing in the sunlight the dark recesses, gloomy cañons, stupendous precipices, and glancing pinnacles which everywhere dot its jagged slopes. Between the lake and this range of mountains, the three highest of which bear the names of Langford, Doane, and Stephenson, lies Brimstone Basin, the ground around it impregnated with sulphur, and the air tainted with its noisome exhalations. Streams of warm sulphur water course the hill-sides and unite to form a considerable rivulet known as Alum Creek, whose channel is coated with a creamy white mixture of silica and sulphur. This basin, some three miles in extent, has apparently been the scene of thermal activity at no remote period, though its waters are now not above the ordinary temperature. Minor brimstone basins are common round the lake, and the more level districts around are covered with a thin crust of the same deposit, underlaid by scalding mud, most dangerous to horse and man, as exemplified by the accompanying graphic sketch of "breaking through."

The high volcanic range which shuts off the Yellowstone Basin from the Wind River drainage, the loftiest as well as the most remarkable lateral ridge of the Rocky barrier, forms the great water parting of the Northern Continent. The Indians regard it as the "crest of the world," and among the Blackfeet there is, we are told, a fable, that he who attains its summit catches a view of the land of souls, and beholds the happy hunting-grounds spread out before him, brightening with the abodes of free and generous spirits. This lofty mountain barrier holds a geographical position analogous in effect, though far less in extent, to that of the Pamir Plateau in Central Asia. On either side spring the mighty water systems which irrigate the entire continent. For miles Dr. Hayden's party of discovery travelled along a ridge of not more than two hundred yards in width, from one side of which the water flows into the Pacific and from the other into the Atlantic. The head waters of the Missouri, the Colorado, and the Columbia rivers have here, within a space of even less than that between the Rhine and Rhone, their source of parting. To the west the outlines of the Teton range, with its shark-teeth summits, are clearly visible, covered with snow. To the south, for fifty miles at least, none but igneous rocks are to be seen. Among the valleys to the westward beautiful lakes and grassy meadows come in abundance within the field of vision. The best of grass, wood, water, and game await the wants of man and beast. Many passes could be found, Dr. Hayden thinks, from the Snake River to the basin of the Yellowstone by which a road could easily be made. Debarred as it is by its consecration as a "thing of beauty" for ever from the ordinary purposes of agricultural or commercial development, this remarkable region is doubtless destined to form the centre of a world-wide traffic, by the sheer attraction of its loveliness and its interest to men of science. A foremost place amongst the physical wonders of the world will beyond doubt be assigned henceforth to the great geyser region of the Yellowstone Valley. For the space of a dozen miles long and two or three miles wide there is a display of boiling and spouting springs on a scale so stupendous that all the corresponding phenomena elsewhere in the world brought together into an equal area would make but a sorry show by the side of them. These grand ebullitions of

* *Wonders of the Yellowstone.* Edited by James Richardson. Illustrated with 17 Engravings. "Illustrated Library of Travel, Exploration, and Adventure." New York: Trübner & Co. 1873.

water, steam, and mud are various in volume, beauty, and power. Generally intermittent in character, they differ in the regularity or persistence of their periodical flow. "Old Faithful," like a sentinel at the head of Fire-hole Valley, sending up a grand column of water six feet in diameter, to a height of 100 or 150 feet, holds itself steadily erect for fifteen minutes, playing once an hour quite regularly. Just across the river and close to its margin stands a siliceous cone, very symmetrical, corrugated on its exterior surface, three feet in height and five in diameter at the base. This curious natural cauldron, which none of the exploring party took for a geyser, it being perfectly inert as they sat down to breakfast by its side, suddenly shot up and sustained for eighteen minutes a column of hot water, which from careful triangular measurement was found to be 209 feet in height. From its form, which is shown in the woodcut, they called it the Beehive.

A hundred yards further from the river near the centre of the large group of boiling and spouting geysers, of which the Beehive is one, is a large oval aperture with scalloped edges, the diameters of which measure 18 and 25 feet, the sides corrugated and covered with a greyish-white siliceous deposit distinctly visible for 100 feet down into the depth. No water was to be seen at first, though it could be heard gurgling and boiling at a great distance below. Suddenly up it rose, sending up volumes of steam, causing a general stampede among the explorers. After a terrible spasm it burst out with incredible rapidity and momentum, rising in a column the full breadth of its immense aperture for 60 feet. Through and out of this vast aqueous mass five or six lesser jets or columns of water, varying from 6 to 15 inches in diameter, were projected to the marvellous height of 250 feet. This grand eruption continued for twenty minutes, the gleams of the sun filling the sparkling column with myriads of rainbows, their arches for ever fluttering and changing in the light. Two of these wondrous ebullitions were displayed during the twenty-two hours of the party's stay by this wondrous geyser, which they named the Giantess. Other forms have given occasion to the fanciful names of the Castle, the Saw Mill, the Comet, and the Grotto. The Fan Geyser, forming one of the illustrations, recalls in its graceful and symmetric discharge the artificial beauties of Versailles and Sydenham. Its branching and intersecting jets rise to a height of 60 feet, lasting from 10 to 30 minutes, with sharp detonating reports at intervals. Some neighbouring hot springs are of a deep blue colour, and have fantastic caverns distinctly visible below the surface of the water. In others a red or brown leathery deposit clings to the sides and bottom of the cavern, waving to and fro like water plants. Towering above all, is seen the Grand Geyser of the Fire-hole Basin, the champion geyser of the world, springing from a vast well in the strata from 20 to 25 feet in diameter, down which, when quiet, the eye can pierce to a depth of 180 feet:—

> The edge of the basin is bounded by a heavy fringe of rock, and stalagmite in solid layers is deposited by the overflowing waters. When an eruption is about to occur the basin gradually fills with boiling water to within a few feet of the surface, then suddenly, with heavy concussions, immense clouds of steam rise to the height of 500 feet, and the whole great body of water, 20 by 25 feet, ascends in one gigantic column to the height of 90 feet; from the apex of this column five great jets shoot up, radiating slightly from each other, to the unparalleled altitude of 250 feet from the ground. The earth trembles under the descending deluge from this vast fountain; a thousand hissing sounds are heard in the air; rainbows encircle the summits of the jets with a halo of celestial glory. The falling water plows up and bears away the shelly strata, and a seething flood pours down the slope and into the river. It is the grandest, the most majestic, and most terrible fountain in the world. After playing thus for twenty minutes it gradually subsides, the water lowers into the crater out of sight, the steam ceases to escape, and all is quiet. This grand geyser played three times in the afternoon, but appears to be irregular in its periods, as we did not see it in eruption again while in the valley. Its waters are of a deep ultramarine color, clear and beautiful. The waving to and fro of the gigantic fountain, in a bright sunlight, when its jets are at their highest, affords a spectacle of wonder of which any description can give but a feeble idea. Our whole party were wild with enthusiasm; many declared it was 300 feet in height; but I have kept, in the figures as set down above, within the limits of absolute certainty.

Scarcely less wondrous is the Lower Geyser basin, in which groups of springs, a hundred or more in number, abound, interspersed with mud basins and jets. Sulphur, silica, and iron are deposited thickly and widely around. In some of the basins were found butterflies, grasshoppers, and other insects which had fallen in and been scalded to death, and which on being taken out were found to be partially petrified and coated with silica. Here and there fallen pines, with their thick top, leaves and cones, were found thoroughly silicified. Looking back over the valley on his departure, Dr. Hayden saw it literally filled with columns of steam ascending from more than a thousand vents. He could compare the view to nothing but that of some manufacturing city like Pittsburg as seen from a high point, except that, instead of black coal smoke, there were here the white delicate clouds of watery vapour. It is a satisfactory thought that this region of marvels is, so far as human foresight is to be trusted, destined to be spared the pollution which has befallen so many a shrine of nature's purity and loveliness.

LORD HOUGHTON'S MONOGRAPHS.*

PROBABLY none of our readers will require to be told that Lord Houghton is a continuation of Mr. Richard Monckton Milnes. He entered the House of Commons nearly forty years ago, and had gained reputation as a poet of merit and promise before ancestral connexion and fortune made him a legislator. In society he has been long known by an appellation indicating general kindly recognition of his accomplishments and amiable social qualities, and the familiar friendly name has not left him since he became Lord Houghton. Some four-and-twenty years ago he was described in *Tancred*, under the name of Mr. Vavasour, as "a social favourite," and Mr. Disraeli proceeded:—

> A poet, and a real poet, quite a troubadour, as well as a member of Parliament; travelled, sweet-tempered, and good-hearted; very amusing, and very clever. With Catholic sympathies and an eclectic turn of mind, Mr. Vavasour saw something good in everybody and everything . . . . Vavasour liked to know everybody who was known, and to see everything which ought to be seen. His life was a gyration of energetic curiosity, an insatiable whirl of social celebrity. There was not a congregation of sages and philosophers in any part of Europe which he did not attend as a brother. He was present at the camp of Kalisch in his Yeomanry uniform, and assisted at the festivals of Barcelona in an Andalusian jacket. He was everywhere and at everything; he had gone down in a diving-bell and up in a balloon. As for his acquaintances, he was welcomed in every land; his universal sympathies seemed omnipotent. Emperor and King, Jacobin and Carbonari, alike cherished him. He was the steward of Polish balls, and the vindicator of Russian humanity; he dined with Louis Philippe and gave dinners to Louis Blanc.

The present volume contains some very choice results of this large and various acquaintance and all-embracing sympathy. The bee, wandering over a large expanse and variety of flowers, has sipped honey from every one, and the public is now made free of some of the finely elaborated store. Lord Houghton introduces and makes known Soleiman Pasha, a Frenchman, a devoted soldier of the first French Emperor, who became afterwards an Egyptian celebrity, and whose noble character and great Egyptian achievements make him well worthy of description for the world. Cardinal Wiseman confided a great political secret to our author; he won the special love of Heine, who disliked England and the English; he has divined the secrets of Alexander von Humboldt when enjoying the friendship and companionship of Prussian kings who honoured him, regarding them as men and as friends, and scorning all the Court surroundings of pettiness, frivolity, and insolence. Lord Houghton was the intimate of the interesting Miss Berrys, the incomparably witty Sydney Smith, and the brilliant, truculent Landor. He has something new to tell of every one of his subjects. His book is a choice olio of fine fruits.

Harriet, Lady Ashburton, is a lady who did not seek or expect public fame. Sixteen years have passed since she died; her husband has followed her to the grave; and she left no children. Lord Houghton therefore may be held justified in publishing his account of a clever, remarkable woman, and he has sketched the lady with admiration, but with frankness. She was the soul and centre of a remarkable literary group, in which Mr. Carlyle was a foremost figure. She could make herself unpleasant, and perhaps without deliberate ill-nature rather rejoiced in doing so. She had her profound admirations; but she was quick to detect vanities, and not unwilling to show that she knew them. The Princess Lieven said of her conversation, "qu'il vaudrait bien s'abonner pour entendre causer cette femme." But there were many, Lord Houghton says, to whom her ways of talk were not pleasing:—

> There were many estimable people to whom the electric transition from grave to gay was thoroughly distasteful; and there were others who, distanced in the race of thought and expression, went away with a sense of humiliation or little inclination to return. Many who would not have cared for a quiet defeat, shrank from the merriment of her victory. I remember one of them saying: "I do not mind being knocked down, but I can't stand being danced upon afterwards." It was in truth a joyous sincerity that no conventionalities, high or low, could restrain—a festive nature flowering through the artificial soil of elevated life.
>
> There could be no better guarantee of these qualities than the constant friendship that existed between Lady Ashburton and Mr. Carlyle—on her part one of filial respect and dutcous admiration. The frequent presence of the great moralist of itself gave to the life of Bath House and The Grange a reality that made the most ordinary worldly component parts of it more human and worthy than elsewhere. The very contact of a conversation which was always bright, and never frivolous, brought out the best elements of individual character, reconciled formal politicians with free men of letters, and men of pleasure with those that bear the burden of the day. "Ask me to meet your printers," was the often-quoted speech of a lady of fashion. Of course there are barriers in our social life which no individual will or power can throw down. You cannot bring into close sympathetic communion the operative poor and the inoperative rich any more in intellectual than in physical relations, but all that was possible was here done. Patronage was neither given nor taken: if the person suited the society, and showed by his contribution or his enjoyment that he did so, he might be quite sure of its continuance; otherwise he left it, without much notice taken on one side or the other. That this was not always so, an amusing passage between Mr. Thackeray and Lady Ashburton illustrates. Having been most kindly received, he took umbrage at some hard rallying, perhaps rather of others than of himself, and not only declined her invitations, but spoke of her with discourtesy and personal dislike. After some months, when the angry feeling on his part had had time to die out, he received from her a card of invitation to dinner. He returned it, with an admirable drawing on the back, representing himself kneeling at her feet with his hair all aflame from the hot coals she was energetically pouring on his head out of an ornamental brazier. This act of contrition was followed by a complete reconciliation, and much friendship on her part towards him and his family.

This clever, caustic lady was daughter of an Earl of Sandwich. Her youth at home had been unhappy. "She often alluded to the hard repression of her childhood, and its effects. 'I was constantly punished for my impertinence, and you see the result; I think I have made up for it since.'" She was married to Mr. William Bingham Baring, eldest son of Alexander Baring, the

---

great merchant, whom Sir Robert Peel made Lord Ashburton. For five-and-twenty years of her life she was Lady Harriet Baring, and Lady Ashburton. It is touching to read, in Lord Houghton's well-wrought notice of her death and burial, that "in his bitter sorrow Lord Ashburton did not forget, to use his own words, 'the singular felicity that had been accorded to him in more than thirty years of unclouded happiness in the companionship of this gifted woman.'"

The bright, witty, and cultivated Charles Buller was one of the friends of the house, and Lord Houghton passes to a short notice of this amiable and gifted politician, snatched from us at an early moment when he was just emerging in the House of Commons to high political office. The following is an amusing account of the effects of an extremely clever squib concocted by Charles Buller and Richard Milnes:—

As an episode in our intimacy, I am glad to remember a *jeu d'esprit* which we concocted on the occasion of the Queen's first Fancy Ball, where the chief characters of the court and times of King Edward the Third were represented. This was a supposed debate in the French Chamber of Deputies on the preceding day, reported "by express" in the "Morning Chronicle:" originating in an interpellation of M. Berryer, to the effect—"Whether the French Ambassador in England had been invited to the *bal masqué* which is to be given by the haughty descendant of the Plantagenets for the purpose of awakening the long-buried griefs of France in the disasters of Cressy and Poictiers and the loss of Calais." This speech, by Buller, is an excellent imitation of the great orator's manner, though I remember protesting against the grotesqueness of the demand "Whether M. de St. Aulaire was going with his *attaches*, with bare feet and halters round their necks, representing the unfortunate Burgesses?" It concluded with the declamation—"It is on the banks of the Rhine that the cannon of France ought to accompany the dancers of St. James's. It is by taking the Balearic Isles that we should efface the recollections of Agincourt." I followed in the name of M. de Lamartine, reproving the speaker with talking of the "vilification of France," and saying France could well afford to leave to each people its own historical traditions.—"Ah! let them have their splendid *guinguette*—that people at once so grave and frivolous. Let them dance as they please, as long as the great mind of France calmly and nobly traverses the world." Lamartine was answered by M. de Tocqueville (also mine), finding fault with the ball chiefly as a repudiation of the democratic idea, and a mournful reaction against the spirit of the times; saying, with a sad and grave impartiality—"We too have erred—we too have danced and costumed—the heirs of the throne of July have sanctioned this frivolity, but there was no quadrille of the Heroes of Fontenoy!" M. Guizot (Buller) closed the discussion by stating that Lord Aberdeen had given the most satisfactory explanations—that the Queen of England desired to educate her people by a series of archæological entertainments; but that, in deference to the susceptibilities of France, M. de St. Aulaire would represent the Virgin of Domremy—he would go as "Joan of Arc." It seems incredible that what we meant for a political squib should have turned out a success-ful hoax. It was discussed with gravity in the clubs; and, at the ball itself, Sir Robert Peel told me, with great satisfaction, that Sir James Graham had rushed into his private room in Whitehall Gardens with the paper in his hand, exclaiming, "There is the devil to pay in France about this foolish ball."

Charles Buller had been made President of the Poor Law Board about a year before he died. He had not been introduced into the Privy Council, and Lord Houghton was mistaken in styling him "The Right Honourable" in the epitaph which he composed for his monument in Westminster Abbey, and which he has reproduced in this volume. The records of the Privy Council do not contain Buller's name. It is of no great consequence. The prefix of Right Honourable would not improve the names of Francis Horner, Joseph Hume, or Richard Cobden, and it is so with Charles Buller. Lord Houghton doubts if Charles Buller's humorous temperament would have permitted him to attain or to maintain a very high political reputation. We think that this is an error. It is exceedingly likely that in his earlier career in the House of Commons Charles Buller had been regarded as a joker, and the solid and serious parts of his character had not been duly appreciated. But in twenty years of House of Commons' apprenticeship he had made his higher faculties known, and his rich cultivation, philosophic mind, and statesmanlike capacity were generally recognized. The time had come when his wit and humour enhanced his power and strengthened his position. If he had been kept back latterly in the political race, it was not by his joking, but by his deficiency in the all-important attributes of family and fortune. When Lord John Russell became Prime Minister in 1846, he made Mr. Charles Wood (now Lord Halifax) a Cabinet Minister and Chancellor of the Exchequer, and Mr. Charles Buller Judge-Advocate-General, which was not a Cabinet office; and again in the following year he made him President of the Poor Law Board, not yet admitting him to the Cabinet. Charles Buller used to say of Lord John, in his quiet trenchant way, that when he had an office to fill up he invariably first looked through the pages of his Debrett. Lord Lytton, in "St. Stephen's," rightly gauged the strength and depth of Buller's mind:—

> Farewell, fine humourist, finer reasoner still,
> Lively as Luttrell, logical as Mill!
> Lamented Buller; just as each new hour
> Knit thy strong forces into steadfast power,
> Death shut thy progress from admiring eyes,
> And gave thy soul's completion to the skies.

A very serious statement about Lord Russell is made by Lord Houghton on the authority of Cardinal Wiseman. We give it in Lord Houghton's cautious words. That Lord John Russell should have encouraged the Cardinal to those Papal proceedings in England which Lord John Russell, breaking through all official restraints, was the first, in an impulsive *provocatio ad populum*, to denounce, cannot of course be accepted without knowing what is to be said on the other side:—

He [Cardinal Wiseman] had also had an interview and conversation with Lord John Russell before he left England for Italy, of which he always spoke as affording a vindication of his future proceedings. Its confidential and private nature, he said, prevented him from appealing to it during his lifetime; but he had written a record of it, which must, some day, be generally known, and would seriously affect the estimate of the imprudence of his conduct. If this is so, it is the more singular that the first overt act declaratory of opinion in high places, and premonitory of public indignation, should have proceeded from Lord John Russell. What was called "the Durham letter" was no doubt his personal production, and in no way sanctioned by his Cabinet: but it had all the effect of a political encyclic.

Among several new good stories of Sydney Smith, we are infinitely pleased by Lord Houghton's mention of a young lady "who responded by a fit of laughter to his grace after dinner, exclaiming, 'You are always so amusing.'" Humour possessed him; he could not get rid of it. Let us thank Lord Houghton also for giving us the piece of fun, not Sydney Smith's, but as good as any of the witty Canon's jokes, of the French author who has seriously described the curly-headed poodle Byng as "nommé, à cause de sa fidélité, Poodle."

There is a "monograph," not one of Lord Houghton's, to which we travel for better knowledge of our author, and which adds much to that understanding of his individuality which is so important for the due appreciation of his writings. Mr. Buchanan's sketch of the young ill-starred Scotch poet, David Gray, is the monograph we refer to. The poor youth comes up almost penniless from Glasgow, and presents himself to Mr. Milnes, with whom he had corresponded, and who had wisely and kindly advised him not to fling himself on literature, but to stay at home and embrace a profession (the Church) in which his parents longed to see him. The youth was suddenly attacked in London by illness, which was soon seen to be dangerous, and in a little time proved fatal. Mr. Milnes sent him his doctor, who at once saw the serious nature of the malady. In illness the poetic fame which he yearned for was uppermost in his mind. He said one day, "If I die, I shall have one consolation; Milnes will write an introduction to my poems." Mr. Buchanan describes the wealthy poet and fashionable member's ministrations to his poor young friend from Glasgow:—"Mr. Milnes himself, full of the most delicate sympathy, trudged to and fro between his own house and the invalid's lodging; his pockets laden with jelly and beef-tea, and his tongue tipped with kindly comforts. Had circumstances permitted, he would have taken the invalid into his own house." The young poet died in his twenty-fourth year; and Lord Houghton wrote the inscription for his monument, which pleases us more by its simplicity than his elaborate epitaph on Buller. We cannot but connect this story of David Gray with Heine's speech to an English lady, who, in Lord Houghton's Heine monograph, charmingly tells the little history of her relations with Heine. The German poet confesses to her that, in a visit to England, he had conceived a distaste for the country and the people, and adds, "But England has finely avenged herself in sending me most excellent friends; you (dich) and Milnes—the good Milnes—and several others." The good kind heart is transparent throughout this volume, which contains many thoughtful and many eloquent passages, but which will probably be most interesting to the generality of readers as displaying Lord Houghton's faculty of seeing, as Mr. Disraeli said of him, "good in everybody and everything."

THE CRUISE OF THE *ROSARIO*.*

WE lately reviewed the record of a cruise against slave-trading in the Indian Ocean. The same detestable practice is carried on in the Pacific, and in a form far more detestable. In the East African slave-trade the victims and their oppressors are in that stage of civilization of which slavery is a natural concomitant, and where it implies no general moral degradation on either side. In the Pacific, on the contrary, the slave-traders, being for the most part Englishmen, appear to be unmitigated scoundrels. If they are not scandalously maligned, they have been guilty of practices for which hanging would be a moderate punishment. If some who have been convicted escaped the gallows, it appears to have been chiefly because the worst sinner of the party escaped by turning Queen's evidence. A favourite hunting-ground of these ruffians is a number of islands called the Solomon, Santa Cruz, and New Hebrides groups. Lieutenant Markham, who was sent to this region in command of H.M.S. *Rosario*, gives an interesting account of its history. The New Hebrides were first discovered so long ago as 1567, by a Spanish expedition from Peru. The adventurers were under the impression that they had discovered Solomon's land of Ophir. Two or three more expeditions followed, and an attempt was made to form a permanent settlement. The plan, however, came to nothing, and after the death of the chief explorer, in 1616, the islands were left in their primitive repose for another century and a half. They were then visited by the *Swallow*, on an exploring expedition under Captain Carteret; but they have even to this day been but partially explored; and Lieutenant Markham tells us that many of the discoveries of the early Spanish adventurers remain to this day "unverified and unchallenged." This retired corner of the world has naturally attracted the attention of the slave-dealers. A few missionaries have been settled there by the Reformed Presbyterian Church in Scotland, of whose labours Lieutenant Markham gives a very favourable account; and an occasional whaler touches at the islands, or even makes a more or less permanent settlement. But the natives are, gene-

* *The Cruise of the "Rosario."* By Albert Hastings Markham. London: Sampson Low & Co. 1873.

rally speaking, almost in the same condition as when the islands were first sighted by the Spanish adventurers in the sixteenth century; and if they had not become a marketable commodity, it is probable enough that they might have been left undisturbed for as many centuries to come.

They are not, indeed, a very attractive race, if we may judge from the general testimony of explorers. Besides being confirmed cannibals on some at least of the islands, they have a disagreeable habit of waving green boughs from the beach in token of a peaceable disposition, and discharging flights of poisoned arrows as soon as the unsuspecting travellers come within hail. This has not unnaturally prejudiced the outside world against them, though such testimony cannot be received without some suspicion. In return, the rare visitors have been in the habit of conciliating the simple islanders. We use the word in the sense for which one of Hood's poems (if we recollect rightly) is our authority. He describes the process of driving a flock of sheep into a butcher's shop. The innocent creatures, objecting to enter, were treated so roughly that a benevolent bystander suggested to the butcher that he should try the plan of conciliation; whereupon the butcher, seizing a luckless sheep by the first portions of his body which came to hand, hurled him neck and crop through the doorway, triumphantly exclaiming, "There, I've conciliated him!" In the earliest expedition we are told that the conduct of the Spaniards was "not otherwise than humane," and that they "always seem to have endeavoured to conciliate" the natives. However, it appears in the next paragraph that the Spanish pilot used to seize the canoes and then give them back "in exchange for pigs and poultry." In a subsequent expedition the same gentleman is said to have conciliated the natives by kindness. His method was to "seize a chief, chain him up, shave his head, put a wig and a hat on him, and a lace doublet, and let him go." The stupid native did not always, it would seem, detect the conciliatory motive which lay hid under these ceremonies. Of late years, however, conciliation has been tried on a larger scale and by more energetic measures. Lieutenant Markham sailed with the firmest intentions of being conciliatory in the fullest sense of the word; and, although he was forced to burn a certain number of villages and canoes—a proceeding which he holds to have produced a very satisfactory influence upon the native mind—we do not see that he could possibly have done otherwise under the circumstances. In fact, what with a free use of poisoned arrows on one side and of conciliation on the other, it is difficult to see how a good understanding could be reached in a moment. There is a hideous catalogue of wrongs inflicted on both sides; and though the white man has been by far the most guilty, it is of course impossible to allow him to be attacked with impunity.

Thus, for example, it was Lieutenant Markham's duty to inquire into the circumstances of poor Bishop Patteson's murder. The murder was in every way a most lamentable event; for no one seems to have been more active in improving the condition of the natives than the man whom they treacherously killed. When, however, we go into the preceding circumstances we cannot affect to be very much surprised at the crime. In 1865 Commodore Sir W. Wiseman had visited the islands in H.M.S. *Curaçoa*, anchoring off Erromango island. The Commodore, "in consequence of a report which he had received," fired twenty shells and four rockets into a village. One of the shells is said to have burst in a cave where the people had taken refuge and to have done frightful damage. The island thus conciliated, the Commodore returned to Sydney. Now we have no intention of asserting that the punishment thus inflicted was excessive. Not having received any reports as to the crimes which provoked it, we cannot form any opinion upon the merits of the case. We are told, however, that the natives had been committing many outrages; and outrages, however provoked, must of course be punished. Meanwhile, the outrages were by no means confined to the natives. Lieutenant Markham, for example, gives us the following anecdote on the authority, as he declares, of a trustworthy eye-witness. The natives, it should be said, have a taste for ornamenting their villages with the heads of their enemies. The white traders accordingly contract to supply them with heads in return for slaves. It is strange, by the way, to observe that the first effect of British commerce is thus to introduce a kind of adulteration in this article of trade, and to provide a simple cannibal with a sham enemy's head, just as a civilized European is provided with a sham coat of arms. A brig engaged in this traffic hove to off the island of Florida; a canoe came under her stern, the stern-boat was "accidentally" lowered on to the canoe, and its occupants were tumbled out into the water; other boats were then lowered to pick up the swimmers, and as each man was raised his head was cut off with a long knife on the gunwale of the boat. We would hope that there may be some mistake in this horrible story, for it seems to be a roundabout way of procuring both heads and slaves. One does not quite see why the natives should not have been kidnapped at once, instead of taking their heads for barter. But though we feel a shade of scepticism in regard to this story, there can be no doubt as to the truth of the ghastly story of the *Carl* of Melbourne. This ship was actually overhauled by the *Rosario* a few days after the hideous massacre of which the details were revealed in the trial at Sydney. Our readers may probably remember the main facts of the case; how a number of kidnapped natives endeavoured to escape from the hold; how the Englishmen—we are ashamed to call them by the name—fired for eight hours into the mass of struggling wretches; and how, when the "mutiny" was subdued, sixteen badly wounded natives were thrown overboard. The traces of the massacre were so carefully removed that the *Rosario* discovered nothing; but on arrival at Sydney the truth came out; two men were sentenced to death, though afterwards reprieved. When such practices were common, one cannot be surprised that the natives became rather angry. We may add that, amongst other tricks, the kidnappers were in the habit of dressing up one of their number in a black coat and hat with a pair of spectacles, in order to persuade the natives upon islands visited by the Bishop that he was a missionary. The disguised ruffian told the natives that their friend the Bishop was unwell on board the ship, and invited them to come and see him. They were invited to step down in his cabin, one or two at a time, and immediately seized and thrown into the hold. After this we can hardly be surprised at the murder of the Bishop, and indeed our chief regret must be, not that somebody was killed, but that the wrong man was killed. Indeed, according to native customs, even this error was venial. Their theory is that a tribe should suffer for the misdeeds of an individual; and they naturally suppose that all white men belong to the same tribe. We are told with a certain *naïveté* that, after the murder of another missionary, "a small party of Christian men" went to the offending tribe and killed three men and one woman belonging to it. "They felt so grieved and enraged that they could not restrain themselves." Indeed the missionary report which records their performance does not seem to blame them very decidedly.

Doubtless this is a melancholy state of things, and one which calls for a steady and intelligent system of superintendence. Here are a number of Oceanic islands; the inhabitants are cannibals and savages; they have scarcely come into contact with Europeans, except an occasional kidnapper or missionary; at rare intervals a few white men drop down upon them, as it were from the sky, and forcibly carry them off to the unknown world; in case of resistance, they are "conciliated"; by way of protest, they carry out their national custom of revenging themselves upon the white man's tribe; unluckily, instead of killing a kidnapper, they kill a noble and self-sacrificing missionary; though, whether it is a missionary or a kidnapper, they have to be conciliated over again. What inference can they possibly draw, if they are capable of reasoning at all, except that white men are a mysterious race of oppressors, who enslave them by force if they are submissive, and punish them with terrible emphasis if they resist? Whether they will learn in time to reduce themselves to a sheeplike frame of mind, or be exterminated before they have learnt submission, is a question which will probably be answered pretty soon; and we would hope that an energetic enforcement of the laws lately passed for their protection may lead to its being answered in the most favourable sense. Lieutenant Markham burnt some villages and canoes in the island where the Bishop was killed; he could hardly have done less, and indeed he seems to be a thoroughly humane man and fully sensible of the wrongs suffered by the natives. We hope that, whilst native outrages are repressed, the far worse outrages perpetrated by English ruffians may be put down with a strong hand; if half that is said in this book be true, they deserve, if not poisoned arrows, at least some more civilized mode of terminating their career.

POEMS OF SIR DAVID LYNDESAY.*

WHY, it may be asked, are we at this time of day reviewing books the youngest of which is as much as four years old? Our answer must be that, in presence of the Early English Text Society, we feel pretty much as Queen Candace's Treasurer felt over his Scriptural readings. We cannot always undertake to understand what we read except some man should guide us. Commonly the Society is good enough to find some man to guide us, be it Mr. Furnivall in person or any lesser light. Commonly our guide takes good care of us at both ends, welcoming us with a Preface, and bidding us farewell with a Glossary and Index. Now and then, however, divorces or dismemberments of volumes have taken place; and we have sometimes found the guiding matter in some corner where we should not have looked for it. We have therefore waited a long time in hope that we might sometime or other get hold of Mr. Hall's Preface to Sir David Lindesay. But, if such a writing is in being, it has certainly hid itself in some lurking-place which is quite past our power of finding out. We have therefore at last screwed up our courage to go down into the arena alone and grapple with the Lord Lyon how we may, with no one to teach us the proper laws of the game. If we get all wrong, if we get sorely scratched by the claws of the rampant King at Arms, it will not be our own fault. Mr. Hall at least, safe up among the spectators, will have no right to mock at us.

"Sir David Lindesay of the Mount, Lord Lyon King at Arms," is known by name to every one who has read anything either in prose or verse about Scotland under James the Fourth and Fifth. It is however to the reign of the later James and to that of his daughter that he properly belongs, as the poet who brings him across Lord Marmion in the character of Lord Lyon has made an

---

* *The Monarche and other Poems.* By Sir David Lyndesay.

The Historie of ane nobil and wailzeand Squyer William Meldrum, &c. compylit by Sir David Lyndesay, &c.

Ane Satyre of the thrie Estaits, maid be Sir David Lindesay, &c. Edited by Fitzedward Hall, Esq., D.C.L. London: published for the Early English Text Society by Trübner & Co. 1865-1869.

dis-achronism of sixteen years. And, oddly enough, the poet has to cry ke the same moan about an earlier edition of Sir David's works which we have just made about that which is now before us. "It is perhaps to be regretted," we read in the fourth note to the fourth Canto of *Marmion*, "that the learned editor had not bestowed more pains in elucidating his author, even although he should have omitted, or at least reserved, his disquisitions on the origin of the language used by the poet." And he goes on to complain that, when the Lord Lyon says that the first syllables lisped by James the Fifth were "pa, da, lyn," Mr. George Chalmers failed to explain what "any old woman in Scotland will bear witness," the "pa, da, lyn are the first efforts of a child to say, *Whare's Davie Lindesay?*" We confess that, having neither a Scotch old woman nor an Early English Text editor to help us, we should never have found out for ourselves the full force of "pa, da, lyn," which we have known a person of a sceptical turn read, not as "Whare's Davie Lindesay?" but as "papa's darling." We daresay that, through lack of Mr. Hall's guidance, we may equally misunderstand many other places of the Lord Lyon's writings; but, if it be so, we can only say that it is Mr. Hall's fault and not ours.

Sir David Lindesay, we need hardly say, was an early favourer of the Reformation in Scotland, and most of his poems, though some of them are not exactly what we should call pious or moral reading nowadays, were written to help on the movement which their author had so much at heart. The first piece, the "Monarche," was written, as the "Epistil to the Redar" witnesses, when the young Queen Mary was still in France, and evidently before she was married. For he complains that Scotland has no King, that the Queen is away in France, and that it will be a long time

> Or that young tender flour
> Bryng home tyll us ane Kyng and Gouernour.

For we take for granted that no patriotic Scotsman, however closely he might cleave to the old alliance, would have wished to bring in a French King or a French Dauphin as King and Governor over Scotland. Accordingly we find at the end of the poem that it was finished in 1552. The poem itself forms a dialogue between the author, under the name of the "Courtiour," and a "venerable father," named Experience,

> Quhose beird was weil thre quarter lang.

It forms a kind of universal history, the Courtiour asking for knowledge and Father Experience giving it, from the creation of the world onward, the whole being of course written from the author's own moral and religious point of view. Thus, almost before the beginning, at any rate before Adam and Eve have come on the stage, he stops to put forth many stanzas of "ane Exclamatioun to the Redar, twychoyng the wryttyng of vulgare and maternall Language." All the ancient nations, Hebrews, Greeks, Romans, always used their own tongues; he would do the same with all books, the Scriptures and the laws of the land among them, which are designed for the benefit of the people at largo.

> Bot lat vs haif the bukis necessare
> To commoun weill and our Saluatioun
> Justlye translatit in our toung Vulgare.

But he recognizes Latin as the fitting tongue for learning and science of all kinds, for Doctors to write their sophistry, their logic, "thare heych Opinionis," their astronomy, medicine, and philosophy. And he adds, what we should hardly have looked for,

> Latt Poetis schaw thare glorious Ingyne,
> As euer thay pleis, in Greik or in Latyne.

He tells us that, whereas at first there was only one language, there are now threescore and twelve. To that in which he himself writes he takes care not to give any particular name, but a neighbouring tongue still keeps the name which is most distinctive:—

> Had Sanct Icrome bene borne in tyll Argyle,
> In to Yrische toung his bukis had done compyle.

He goes through the early part of the Old Testament at great length. He tells us, according to his text, that

> The Serpent wes the subtellest
> Aboue all beistis, and craftyest,

but adds, what certainly is not in his text—

> Than Sathan, with ane fals intent,
> Did enter in to that Serpent.

When he gets to the story of the sons of God and the daughters of men, the Lord Lyon by no means forestalls Dr. Maitland, though he does not go so far into details as some later commentators about the godly dwellers on the mountains and the wicked dwellers in the plains, but we read how "the sonnis of Sethes bludo" were led astray by

> Seand the plesand pulchritudo
> Off the Ladyis of Caynnis kyn.

And so he goes on with the Flood, Nimrod, Semiramis, and so on, through the conventional Four Monarchies, quoting at different stages Orosius, Josephus, and Diodorus. The Tower of Babel is throughout called a "dungeoun," which may remind some of what they are apt to forget, that "dungeon" and "donjon" are the same word. His account of what happened at the foot of the dungeon might not satisfy a comparative philologer, but it is at least comforting to find so early a date given to our own branch of the common speech:—

> Affore that tyme all spak Ebrew;
> Than sum began for to speik Grew,
> Sum Duche, sum language Serasyne,
> And sum began to speik Latyne.

Ninus, we are told, first invented idolatry, which gives occasion to the Courtiour to ask of Father Experience whether the worship of saints was not just as much idolatry as the worship of false gods. This gives occasion to Father Experience to deliver himself of two sermons; first, "Off Imageis usit amang Cristin men"; after which "Heir Followis one Exclamatioun aganis Idolatrie," in which the reformer breaks out against the abuses of the time, the evil doings of bishops, clerks, and monks, the abuse of pilgrimage, and, above all, "The gret Idolatrye and manifest abominatioun" which went on at Edinburgh, where "ane auld stock Image" was carried about with processions and with all kinds of music—

> Siclyke as Bell wes borne throuch Babilone.

So we go on, but by no means in the same detail, through both Scriptural and profane history, in which Alexander is very harshly dealt with, while great sympathy is shown for "Cesar Iulyus," "gentyll Iulyus," who

> Quhen he had vincust Pompeyus,
> Wes chosin Emperiour and kyng.

And we are told how

> By fals exhorbitant treasoun
> That prudent Prince wes trampit doun
> And murdrest in his counsall hous
> By creuell Brutus and Cascius.

The Father takes special care to tell us that the Four Monarchies, Rome amongst them, have all of them passed away, and the latter part of the third book goes off into a declamation against the Pope and his priests in all parts of the world. Of the later Empire and indeed of later history in general there is very little mention; only he takes care not to leave out the legend of Alexander the Third trampling upon Frederick Barbarossa, to which he oddly gives the date of 1156. The fourth book is taken up with one of the usual descriptions of the end of the world, in which great woes are threatened against Popes and other Churchmen. A good deal of this of course is the same sort which one may find over and over again in the writers of the time. The passage of most real value is one too long to quote at length, beginning at verse 4709, where he describes the greediness of the parish priests in exacting their mortuary dues. The poor man dies leaving two or three small bairns, and "thre ky, withouttin mo." The vicar takes the one cow "with the gray cloke that happis the bed" on the death of the father. If the wife dies on the morrow the vicar "cleikis awaye" the other cow and the wife's "pure coit of roploch graye." Then, if the eldest child dies, the vicar takes the third cow, and the other children who are left have to wait with the dead bodies at the kirk stile till the uttermost farthing of church dues is paid. Still the clergy are not the only hardhearted ones, for

> Than cumis the Landis Lord, perfors,
> And cleiks tyll hym ane herield hors.

And the Lord Lyon does not scruple to say that the law which allows such things is "brother tyll Oppressioun." Towards the end of the poem comes a picture descriptive of evening, which shows that Lindesay was not merely a reformer or declaimer, but a real poet:—

> The blysfull byrdis bownis to the treis,
> And ceisis of thare heuinlye armoneis;
> The Cornecraik in the croft, I heir hir cry;
> The tak, the Howlat, febyll of thare eis
> For thare pastyme, now in the ewinnyng fiels;
> The Nychtyngaill, with myrthfull melody,
> Hir naturall notis persith throw the sky,
> Tyll Synthea,—makand her obseruance,—
> Quhilk on the nycht dois tak hir dalyance.

Then we come to "The Tragedie of the Umquhyle maist reverend Father David, be the Mercy of God, Cardinall and Archibyschope of Sanctandrous, &c.," which is put into the mouth of the Cardinal (Beaton) himself. He is made to confess his misdeeds both in Church and State, and to exhort his brother prelates to do better; but he does not make any recantation in point of doctrine. It may perhaps have been thought that he had not much to do with theology proper on either side. Then comes "The Testament and Complaynt of our Soverane Lordis Papyngo, Kyng James the Fift." "James the Fift," it should be noted, is the genitive case, in apposition to "Soverane Lordis," and the Papyngo is no other than a popinjay or parrot, which is described as belonging to the King of Scots, and as having been taught by the King at Arms. Some of the parrot's accomplishments bring out some very vigorous words expressing the sounds of animals. The papyngo could—

> Syng lyke ye Merle, and crawe lyke to the coke,
> Pew lyke ye Gled, and chant lyke the Laverock,
> Bark lyke ane Dog, and kekell lyke ane ka,
> Blait lyke ane hog, and buller lyke ane bull,
> Gaill lyke ane gork, and greit quhen scho wes wa;
> Clym on ane corde, syne lauch and play the fule.

One would like to know how "ye" for "þe" is written in the manuscript, as the Early English Text Society is commonly careful in sticking to its thorns, and the ȝ is carefully preserved throughout. This clever papyngo, it seems, notwithstanding the Lord Lyon's remonstrances, would climb a tree and get too high, till she was beaten down by the wind and sore wounded, and so she lay, and, what one would hardly have looked for after such teaching, "scho cryit for a preist." The priest comes in the shape of a gled or kite, who is described as a friar, and comes with "corby [raven] monk" his brother. The gled shrives the papyngo, who makes her will, and bequeaths her various parts and gifts to different birds and others. Among these

> I laif the Goik, quhilk has no sang bot one,
> My musyke, with my voce Angelycall;

And, to the Gaue, Ie geue, quhen I am gone,
My Eloquence and young Rethoricall.

But this is not till she has delivered herself of a letter to the King, and another to her brethren of the Court, and, at the request of her holy executors, among whom we should have reckoned the magpie, she has put forth a third discourse, all bearing upon the evils of the time and containing a good deal in the way of summaries of Scottish History. We also get Alexander and Cæsar over again, the latter in a form which strongly savours of the influence of the ancient alliance :—

Quhare beis the heych tryumphant court of troye?
Or Alexander, with his twelf prudent peris?
Or Iulius, that rycht redoutit Hoyr.

Then follow other pieces, "The Dream," "The Complayn of Schir David Lindesay," &c.—all for the most part on the same argument, varied sometimes by a Dantesque visit to the other world. Then the not very edifying history of William Meldrum has a thin volume to itself, and lastly we come to the most famous work of all, the Satire on the Three Estates. But here we begin to see light, not indeed from Mr. Hall, but from one of his brethren. We have another volume of the series before us on a kindred subject, which has a preface which looks very much as if it would do for a preface to Sir David Lindesay, as well as to the book for which it is actually meant. This is Mr. J. A. H. Murray's edition of "The Complaynt of Scotlande, wyth ane Exortatione to the Thre Estaits to be vigilante in the Deffens of their Public veil." We will therefore leave off our feeble gropings by the help of our mother-wit only, and will thankfully accept Mr. Murray's guidance to the Satire as well as to the Complaint.

GETTING ON IN THE WORLD.*

"THE origin of this book," says Dr. Mathews, "which will account for some of its peculiarities of style, is as follows. In the early part of 1871 the author wrote for the *Chicago Tribune* a series of articles on subjects here treated, after the publication of which a considerable number of persons in different parts of the North-West expressed a wish that they should be gathered into a volume. This led to their revision, and the addition of nearly twice as much new matter, the whole forming the work which is now offered to the public." While Dr. Mathews accounts more or less satisfactorily for the peculiarities of the style of his book, he does not give us any explanation of the peculiarities of the style of his preface. *Ne sutor supra crepidam* is a sound maxim, so long as the shoemaker knows how to use his last. But if his shoes always pinch or let the water in, he will show his wisdom by turning his hand to some other trade. So too, generally speaking, it might be well if a "Professor of Rhetoric and English Literature," even in the University of Chicago, were to stick to literature and the science which "teaches how to speak with propriety, art, and elegance." Perhaps, however, our readers after the opening sentence which we have just quoted of Dr. Mathews's work will think that he has done wisely in leaving rhetoric to take care of itself and in turning his attention to teaching his young countrymen the art of getting on in the world. Indirectly no doubt he teaches English, in the same way in which the Helots taught sobriety. We do not know indeed that a good deal of sound teaching might not be given in our own Universities by this old-fashioned method of education. If Mr. Ruskin were made Professor of Political Economy, Mr. Ayrton Professor of Fine Art, Lord Westbury Professor of Pastoral Theology, and Lord Ripon Professor of International Law and Diplomacy, our students would have as good a chance as ever young Spartan had of making progress. Yankee rhetoric, however, is so unlike every other kind of rhetoric hitherto known that perhaps we are rather hasty in assuming that Dr. Mathews has not the whole science and art of it at his fingers' ends. But it would have been as well, if he is the Professor of a new science, that a new name should have been given it. Professor of Bunkum has quite as full a sound as Professor of Rhetoric, and moreover to the American ear would convey a much more exact meaning. We must not do Dr. Mathew an injustice, however, for though he can use very big words, and has learnt "to varnish nonsense with the charms of sound," yet he is by no means given to that excessive worship of his own countrymen which should be the first qualification for this new professorship. If as a Professor of Rhetoric he is over-proud, as a Yankee he is modest enough. Then too, though he has acquired the grand style of writing, he no more brings it out always than the Queen brings out her crown or the Speaker his mace. For many pages together he is as clear as the author of *The Recreations of a Country Parson*, or of *The Gentle Life*. He is in fact an A.K.H.B., or a Mr. Hains Friswell, made a Doctor of Laws, and turned into a Professor. So much sympathy has he with his great English rival, Mr. Friswell, that in the quotations with which he heads one of his chapters he gives a passage from *The Gentle Life*, placing it oddly enough between extracts from Le Sage and La Fontaine. It is not easy to estimate the exact place in which he should be put in a literary point of view. For while he admires Mr. Friswell, he sneers at "the platitudes of Martin F. Tupper." To some critics indeed the difference between these two authors seems so slight—except that one writes what he calls poetry, and the other writes what he calls prose—that they cannot pretend even to see it, much less to estimate it. But we must remember that the perception of a difference depends quite as much on him who sees as on those who are seen. The Emperor of Lilliput, says Gulliver, was "taller by almost the breadth of my nail than any of his court; which alone is enough to strike an awe into the beholders." If Mr. Friswell and Mr. Tupper could be made as it were to stand back to back, it is quite possible that the intellectual height of the one might be found to exceed that of the other in the same degree, and that this difference alone might be enough to strike admiration into an

American Professor of Rhetoric.

Had we come across these essays in the *Chicago Times*, we should not have thought that they merited any severity of criticism. Nay, even when we reflect on what American newspapers so frequently are, we might even have thought them rather praiseworthy. So, too, in our own country, how favourably should we judge of a series of essays by Mr. Friswell, or of poems by Mr. Tupper, if when Parliament was not sitting, but some great divorce case was going on, they filled the columns of the *Daily Telegraph* to the utter exclusion of the reports of the trial! But the articles in a provincial paper are one thing, and the essays of a Professor of English Literature are quite another thing. It is surely not too much to ask of such a Professor that he should be able to exercise sufficient self-restraint to keep him from writing nonsense, however long his work may be. In a book that extends over 380 closely printed pages, as in a life that extends over fourscore years, the temptations to folly are no doubt strong and numerous. Nevertheless there should be certain boundaries—and very narrow ones, too, for a Professor of Rhetoric—and these boundaries Dr. Mathews has, we fear, at times overstepped. He was indeed addressing the young, and felt himself, no doubt, a good deal like a parson preaching a sermon. He had, therefore, a certain excuse for floweriness of language, and might even have been occasionally incoherent when he felt it needful to be unusually impressive. But he was also a Professor of Rhetoric, and he was therefore bound to have as much care for his language as for his subject. The following passage will show to what heights of rhetoric—far beyond our limited understanding to follow—a Chicago Professor can rise :—

> With the exception of the few comet-like geniuses that, at rare intervals, flash through the firmament of humanity, it is the slow-headed, dull, unimaginative man, with colossal powers of labour, and the patience to abide results, and to profit by the mistakes of his more gifted fellow-mortals, that is most likely to come out ahead in the race of life. At cricket-playing it is hard hitting and quick running that win the game. Good fielding, elegant wicket-keeping, fast bowling, are all well in their way; but only notches score. So the game of life is won less by brilliant strokes than by energetic, yet cautious play, and never missing an easy hazard.

With a kind of irony he adds, "Do not misunderstand this." Cricket must be played in a very peculiar way in the North-West, if any one there can understand this passage. In England, we learn from our author, cricket is played "on the downs and heaths." Of cricket he knows perhaps as little as of gymnastics, which in page 372 we find "are utterly unfit for grown persons, especially for hard thinkers." Some unhappy grown person, if not hard thinker, may, before he reaches this late page in the book, have been led by the glorification he finds in page 59 of the gymnastics of the Greeks to do himself an injury which cannot be remedied. These gymnastics, he will there read, "went on under the solemn sanction of sages," while "the orators, philosophers, poets, warriors, and statesmen of Greece and Rome gained strength of mind, as well as of muscle, by the systematic drill of the palæstra." Nay Cicero, "the victim of that train of maladies expressed by the word 'dyspepsia'—maladies which pursue the indolent and the overworked man as the shark follows in the wake of the plague ship"—having "flung himself into the gymnasium," derived such benefit that "his periods were rounded out to a more majestic cadence, and his crushing arguments clinched with a tighter grasp." We do not wish ill to any man. Nevertheless, if dyspepsia keeps the periods from being rounded out, we cannot help hoping that, to a moderate extent, it may still have its victims.

Dr. Mathews has evidently been a great reader, if not a very exact one, for his book is crammed full of references and quotations. In one page he quotes Nelson, Coligny, De Quincy, Cicero, Byron, Bacon, and Sulla, while in the same page Alexander, Scipio, Cæsar, Pompey, the Roman Senate, the English, the Russians, and the Admiralty are referred to. "Andrea Ferrara of Scotland" lived, we learn, "in the fourth century," while Mr. Grote "snatched time from business to write two large volumes upon Plato." If, on the one hand, our author increases Mr. Grote's labours by making him a banker at the time he wrote his volume on Plato, on the other hand he lessens them by cutting down his three volumes to two. Perhaps, however, he may find some excuse for his inaccuracy, at the expense of his country's honesty, for it is quite possible that in the pirated American edition the work is printed in two volumes. But what are such mistakes as these compared with that by which in his index he calls the author of "Jonathan Wild" Joseph Fielding? Has not this Professor of English Literature read Sterne, and is he unacquainted with Mr. Shandy's great hypothesis on the influence of Christian names? Does he not know "how many are there who might have done exceedingly well in the world had not their characters and spirits been totally depressed and Nicodemus'd into nothing"? We shudder to think of the loss the world would have suffered had there been no Henry, but only a Joseph, Field-

---

* *Getting on in the World; or, Hints on Success in Life.* By William Mathews, LL.D., Professor of Rhetoric and English Literature in the University of Chicago. London: Sampson Low & Co. 1873.

ing. After such an error as that, we can scarcely smile at even the wonderful version of a line of Horace, "which has been," he tells us, "the favourite motto in all our colleges"—"Nocturna mane versate, versate diurna." There would seem to be Yankee Latin as well as Yankee English. As Dr. Mathews is only a Professor of English Literature, we ought not perhaps to look for any great accuracy in his knowledge of the dead languages, though he does seem to want to show himself off as on terms of great familiarity with the "solemn sages" of antiquity. But we have a right to protest when we find him writing such passages as "a bubble burst, bankrupting all concerned," and "works are rushed through the press." But as he says, "above all in literature, it is imperatively essential to success that one should be phenomenal." *Getting on in the World*, for the work of a University Professor, is certainly phenomenal, and is therefore, we doubt not, successful.

OBER-AMMERGAU.*

IT is not wonderful that the Passion Play at Ober-Ammergau should have created, even in England, quite a literature of its own. Mr. MacColl set the example, and we have had Recollections, Illustrations, articles in magazines, even lectures delivered from Dissenting pulpits, every fresh critic looking at the matter from his own point of view, and, if he was himself a spectator, adding something to our appreciation of its many-sided dramatic and religious interest. When once the solemnity which has been decennially enacted in an obscure village of the Bavarian highlands during the last two centuries—for, curiously enough, this one relic of a mediæval usage has a post-mediæval origin—began to attract public notice, such a result was inevitable. Its singularity alone would ensure this concentration of popular and artistic interest; and notwithstanding the half profane, half blundering presentations or parodies of the same awful subject, still occasionally to be witnessed in some Spanish and Belgian theatres, singular the Ammergau *Passionsspiel* is, and must remain as long as it survives, which we hope may be the case for many a decade yet. It is unique alike in the simple majesty of its conception, and in its conscientious and almost faultless fidelity of execution. And, as we are reminded by the graceful volume published at Munich on the *Homes of Ober-Ammergau*, the village and its inhabitants are hardly less unique than the performance to which they owe their fame. Those who have been most deeply impressed by the solemn spectacle would be the last to endure the thought of its tranference to a new locality or to other hands. It has in fact acted, ever since its original institution in 1634, as a religious and civilizing influence on the little society, barely numbering 1,300 persons at present, who have ever jealously guarded it as their exclusive heirloom. They are educated by it and for it, from the earliest childhood; it occupies their minds, colours their social intercourse, and to a large extent moulds their habits of life. Their most general occupation is that of wood-carvers, chiefly of devotional objects, crucifixes and the like; and during the nine years' interval between each recurrence of the "Passion year" they are engaged in constantly rehearsing and, as a native writer expresses it, "living into" their several parts, and are specially directed to study the great religious painters. This may go far to account for that remarkable grace of look and manner which cannot fail to strike, and almost startle, visitors as characterizing the simple denizens of a remote mountain village, while the more prominent personages in the play, and especially Joseph Mayer (the *Christus*), exhibit, as has been justly observed, "a dignity and simplicity of mien to which the highest culture could add nothing." The performance and those who take part in it are thus alike unique, to say nothing of the picturesque scenery amid which they live and move, and which adds not a little to the spell of that *religio loci* whose fascination even a passing visitor cannot refuse to acknowledge.

We are not going to enter into a detailed criticism of "M. C. S. D.'s" twenty-four Plates, representing most of the principal scenes in the Passion Play, from the Entry into Jerusalem to the Ascension, the publication of which has suggested these remarks. They have on the whole pleased us much, though betraying throughout the hand of an amateur; and may at least serve vividly to recall, especially by the minute accuracy of the colouring, laid on by the artist's hand, the actual scenes portrayed. But their merit is very unequal, and, with certain notable exceptions, we are inclined to think that the less prominent subjects have been most successfully treated. It is right to add that the lithographer has by no means done full justice to the original drawings. Even a comparison with the local photographs would suffice to convince those who have not themselves been at Ammergau that, as a rule, and conspicuously in the case of the *Christus*, the faces are a decided failure, but this criticism would not apply to the originals. We cannot but feel some surprise that "M. C. S. D." has not given us any of those exquisite tableaux from the Old Testament one or more of which precedes every successive act of the Passion, and which offered such rare scope for artistic treatment. This is the more to be regretted because the photographs of the tableaux are, from whatever cause, almost invariably inferior to those representing the characters and scenes of the drama itself. Yet all who have witnessed the performance will recollect that, with hardly an exception, the marvellous grouping and perfectly motionless repose of the figures—sometimes as many as three hundred, and including children under three years old, sometimes only two or three—in the tableaux themselves, were not less admirable than the adaptation of the type to the fulfilment. Thus, for instance, the manna shower in the desert, and the spies bringing in the grapes of Eshcol, or, in a different way, the conspiracy of Joseph's brethren, and the parting of Tobias from his parents, are pictures which fix themselves on the memory, and of which it would be pleasant to have a permanent record. However, we may thank "M. C. S. D." for what she has done without quarrelling with her for what she has omitted. The combined sternness and dignity of the *Christus* in driving the money-changers from the Temple is one of the first points to arrest attention in the earlier part of the Passion Play, and this is very imperfectly reproduced in the second plate. The parting of Christ from his mother, and the feast in Simon's house, are more satisfactory; but two of the happiest are the fifth plate, representing the final yielding of Judas to the subtle solicitations of the expelled money-changers from the Temple—so wonderfully illustrated by the acting of Gregor Lechner—and the sixth, where Peter and John meet the boy in a green tunic, with his pitcher, in the streets of Jerusalem, who reappears in the next scene (not depicted here) to carry the basin and towel at the washing of the Apostles' feet. In depicting the Last Supper "M. C. S. D." has wisely seized the moment, inexpressibly solemn in its actual presentation, when Christ is standing before the table to consecrate the Eucharist. It is surely a mistake in the Betrayal scene, and one to which the drama gives as little sanction as the Gospel narrative, to represent the High Priest, distinguished by his mystical breastplate, as present in the garden of Gethsemane. It is, by the way, strange that not one of the highly characteristic and dramatic scenes in the Sanhedrim, which are so indelibly impressed on the memory of all who witnessed them, will be found included in the series. Considering the difficulty, which to modern artists seems almost insuperable, of representing such subjects in a manner that in any degree satisfies our sense of fitness without offending our reverence, it is no disparagement to these plates to say that the Buffeting of Christ, the Scourging, and the Crowning with Thorns are inadequate; still, that was not the effect produced by the play itself. The grouping of the figures in the "Ecce Homo," and the scene which follows, where Pilate is washing his hands on the balcony of his house, is very effective. And we hasten to add that the three plates dealing with the Crucifixion are happily among the best of the set. The first represents the summit of Calvary immediately after the elevation of the central cross, and while the soldiers seated on the ground before it are about to tear the red mantle in their hands before proceeding to cast lots for the seamless purple tunic. On either side hang the two thieves with their bodies roped to the crosses, and their arms drawn over the transverse beams. In the centre is the *Christus*, to all appearance fastened by the three nails, which are so slowly and, as it seems, painfully, wrenched out of the hands and feet in the Deposition—really of course by some invisible ligaments which defy the closest scrutiny, the secret of which is only confided to the few persons immediately concerned. However it may be effected, the fatigue of hanging as he does from seventeen to twenty minutes on the cross must be, and is, extreme, and cannot be much lessened by the small rest for the feet, placed over one another, of which, by the by, we cannot detect any trace in these plates. The second of them gives us the cross alone, with the dead figure on it, just after the spear of Longinus has pierced the left side, from which the blood is beginning to trickle; in the third the empty cross stands out dark against the sunset sky, with the long linen band—which is made more voluminous in the picture than in the reality—hung over both arms, and sweeping the ground on either side, while the dead body is laid in Mary's lap at the foot. We are especially grateful to "M. C. S. D." for thus recalling to our minds what was, both in an artistic and a devotional point of view, one of the most profoundly impressive scenes in the *Passionsspiel*—the Deposition from the Cross, and the solemn stillness which follows before Joseph and Nicodemus carry away the body to its burial.

Mrs. Greatorex has pursued a cognate but distinct aim in her *Homes of Ober-Ammergau*, published at Munich, though the letterpress is in English. We have twenty etchings in heliotype, from pen-and-ink drawings taken from different points of view in and about the village, which will, for different reasons, be interesting both to those who have and to those who have not visited the spot themselves. And the interest of these graceful sketches is much enhanced by the notes from a diary kept during a three months' residence there in the summer of 1871, the second year of the Passion Play, which had been interrupted in 1870 by the outbreak of the Franco-Prussian war. We have referred already to the very pleasing recollections which a stranger carries away with him after the casual intercourse of a day or two with the natives of Ober-Ammergau. It is clear from what Mrs. Greatorex tells us, and she had abundant opportunity of judging, that the feeling is not dispelled, but deepened, on closer acquaintance. She was staying at the house of Tobias Flunger, familiar to readers of *Quits* as the *Christus* of 1850, and to all spectators of the last celebration of the Passion Play from the quiet dignity with which he sustained the part of Pilate, while his eldest daughter Franziska represented the Blessed Virgin, and the younger was one of the chorus; he first took part in the tableaux as a little child in 1820. Flunger, when she first saw him, was employed in "plaiting a

* *Ober-Ammergau: Scenes from the Passion Play.* A Set of Twenty-four Plates. By M. C. S. D. Thomas Machlein. 1873.

The Homes of Ober-Ammergau. A Series of Twenty Etchings. Together with Notes from a Diary kept during three months' residence in Ober-Ammergau in 1871. By Eliza Greatorex. Munich. 1872.

crown of thorns for the *Christus*." Her professed object was to live with the people so as to see for herself "how their daily life accords with this marvellous religious service," and the result was entirely to her satisfaction. She especially notices that simplicity and unconsciousness which is so great a charm of the actors, because it is so obviously natural, and characterizes them alike in the theatre and out of it, "yesterday the admired of thousands, to-day forgetting fame in their work in the hayfield or on the mountains." One story, referring to young Johannes Zwink, the St. John of the Passion Play, is so characteristic of a too common peculiarity of the Englishman—or, as in this case, the Englishwoman—abroad, that we cannot forbear from quoting it. The youth was quietly sitting to Mrs. Greatorex, who wished to take his portrait, when the party were startled by a woman's voice outside crying out, "Where is St. John? where is St. John?"—

> The door opened, and a short portly old dame, whose tiny black eyes sparkled from behind her glasses, followed by two pretty young girls, rushed into the room. Frau Zwink said, very quietly, pointing to our subject, "This is my son, Johannes!" The little old lady stopped short before the object of her search, and she and her daughters had a good stare at him, for fully two minutes. They were so interested in him, that they never thought of addressing a word to the poor fellow, who had risen from his seat, and stood like a statue under their gaze. "He's very like his photograph," at last the old lady exclaimed, and turning round she left the room, followed by her daughters, as unceremoniously as she had entered it, shutting the door with a bang. Johannes stood for a minute like one dazed, and then, when he saw us laughing, joined in with good will. This is the way tourists frequently "do up" the principal players at Ammergau.

Let us hope that the delicate courtesy with which tourists are always treated at Ammergau may have some effect in "doing up" this sort of barefaced impertinence. Johannes himself, we may observe, is a painter. His father, the St. Matthew of 1870 and 1871, was himself St. John in 1840. Mrs. Greatorex's diary is full of interesting anecdotes and details about the characters of the play, both in their dramatic and their private capacity. Like every one else, she was greatly impressed with Joseph Mayer. It is pleasant to hear that he promptly rejected the offer of a large sum of money, though he is quite a poor man, to go and act the next summer in England, but it is very unpleasant to hear of so monstrous a proposal being made. "Only think of it," said his wife, "that would make us rich, but Joseph would not do it for all the gold and silver in the mountains." The authoress adds, that she believes, and we daresay truly enough, "that his life is a continual prayer to be made worthy of his position." What most struck her in the characters of all the leading men in the place was the entire absence of ostentation. "I have never heard them boast of their success. They seem to lose all personal feeling in that of the honour paid to their drama." At the end Mrs. Greatorex describes a visit to the venerable Alois Daisenberger, to whom the Passion Play as revised in 1860 owes its present form, and who still lives in the village, universally beloved and reverenced, though he has resigned his parochial charge, first undertaken in 1845, on account of his old age. We can very sincerely recommend the book to all who are interested in Ober-Ammergau, and especially to those who have visited it.

MOGGRIDGE'S ANTS AND SPIDERS.*

WHETHER the ant is really in the habit of exercising its foresight and industry in storing up grain for winter use has long been a subject of controversy. The opinion of modern naturalists has been rather against the providence of the ant, except in the case of tropical ants, which is regarded as isolated and puzzling. So far as the observations of Northern naturalists went, they were no doubt justified in this conclusion; but Mr. Moggridge, who has been investigating the habits of Southern ants on the Riviera, has been led to the belief that what is true of the North is not equally true of the South. The fact is that older authors relied on their Southern experience, while modern observers depend upon what they see in the North. "So long," says Mr. Moggridge, "as Europe was taught natural history by Southern writers, the belief prevailed, but no sooner did the tide turn, and the current of information begin to flow from North to South, than the story began to be discredited."

Four chief points of inquiry suggested themselves to Mr. Moggridge—(1) Were the seeds which he saw carried off by the ants stored by them in granaries for further use, or merely strewn here and there in the nests, or used for building materials? (2) Was there conclusive evidence of the storage of collected seeds *for food*? (3) Did the seed-collecting ants collect aphides and other food also, and, if so, of what sorts? (4) Did all the Southern ants uniformly collect seed, and to the same extent, or only certain species? To these and kindred questions his monograph gives curiously interesting answers. It seems that there are but four kinds of genuine harvesting ants on the Riviera, of which the most prominent are the black ant, called Atta Barbara, and a claret-brown ant, Atta Structor, the latter affecting the neighbourhood of gardens and houses, the former more addicted to wild open ground. Unless where the contrary is specified, Mr. Moggridge's records of the habits of these creatures are drawn from observation of the Atta Barbara. He had got an inkling of these in the May previous to his systematic visit of inspection, and so knew where to drop upon the ants in a valley where he had watched them cutting, carrying, and sorting their harvests. It was a rough slope of soft sandstone, with accumulations of sand and a scrubby overgrowth, to and from which he saw two columns of ants passing diligently, the one with and the other without its load of seed, grain, and capsules. These things came from a cultivated lemon terrace not far off on a lower level, where the weeds at that point of time were in seed. Following the workers to this terrace, he was able to watch the order and method of their foraging, the value they set on the safe transit of the grain, and the precision with which one detachment would sever the capsules from the stalk, drop them, and allow their comrades below to carry them away, so as to realize exactly Ælian's account of the manner in which spikelets of corn were severed and thrown down "to the people below" (τῷ δήμῳ τῷ κάτω) by the harvesting ants which he notices in his *Natural History of Animals* (ii. 25). Of an incoming column most members brought in seeds, a few dead insects, and crushed land-shells, but none aphides; and though it is clear that ants are liable to be taken in sometimes—as, for example, in the case of the gall-like eggs developing a small but well-armed "cynips," which they bring into their nests in mistake for seeds, and the violet seeds which they have been known to mistake for the larvæ of other ants—yet Mr. Moggridge found them soon able to discriminate small white beads, with which he tried to tempt them, from seeds and pupæ. The likely place for a nest, it appears, is indicated by patches of ground on the wild hillside covered with the plants which have come up from seeds obtained from the lemon-terraces and dropped by the ants. The nests of Atta Barbara are excavated out of the earth or sandy rock, and have hard by a refuse mound or kitchen-midden of vegetable matter made up of the plant-rubbish, gnawed seed-coats, and earth pellets which would only crowd the space inside the nest. Some of these heaps are as large as a quart tankard. The sight of one of them led Mr. Moggridge to the inference that seed stores must underlie these nests, and that collections of materials so carefully sifted could not be for building. His first experiment failed to establish this, though he encountered troops carrying seed down subterranean passages. His second, where the depth of the nest was limited by hard rock, exhibited almost at once large masses of seed stored in prepared chambers, some subcylindrical and others horizontal, with concave roofs, and floors composed of cemented mica and silex grains. These granaries, averaging the size of a gentleman's gold watch, and situated from one and a half to six inches below the surface, contained seed, grain, and dried fruits from twelve distinct species; and what was most remarkable was that the seed so stored, though moist, and though it was the season for germination, showed no signs of sprouting. There was abundant evidence of a power exercised by the ants to check germination, and this checking is not through lack of moisture, warmth, or atmospheric air, nor is the vitality of the seeds affected; but, whatever the process may be, it seems to require time and attention. Interruptions caused by other works in the nest and galleries may account for the occasional germination of seeds in the nests. Where this is the case, the growth is found to be checked at the earliest stage. The radicle is gnawed off, the seed carried out to dry, and after exposure carried in again for storage. "The seeds so malted, and the starch changed into sugar," Mr. Moggridge has seen eagerly devoured by the ants.

Mr. Moggridge notes that these ants apparently know how to preserve seeds intact at the precise depth below the soil at which the gardener would mostly sow his seed, though, if these very seeds were to be taken and sown by hand, they would germinate in the ordinary way. No doubt the compactness of the floors and ceilings points to exclusion of air; but the passage of moisture and the circulation by means of open galleries leading to the granaries forbid us to accept this as a full explanation. The opinion that the seeds do thus remain intact, without decay or germination, is supported by the consideration that, were it otherwise, fresh supplies would be constantly needed, whereas it is observable that scarcely a seed is collected between the middle of January and the middle of March, and yet the granaries of a nest will be found well filled at the end of this period. The storehouses in which these minute gleaners collect plants and seeds of as many as eighteen distinct families, the results of wholesale plunder in the gardens of Southern Europe, are equally surprising. At Cannes, in connexion with one nest a complication of galleries and granaries was discovered as deep as twenty inches below the soil, and extending over a space of nearly six feet horizontally. At Mentone two nests were found to go far into the hidden rock, the nests lying in the sandstone itself. The passages and galleries were a sort of tubular tunnels, which could be traced down to twenty-three inches below the surface in a vertical, and sixteen in a horizontal, direction. One tunnel communicated with a cell filled with winged ants and various seed, with walls not glazed, as some are, but coated with a cement distinguishable from the surrounding sandstone. This granary was horizontal, but other vertical galleries led to pear-shaped terminal cells, walled, coated, and floored with smooth plates of mica and cement. In the galleries and granaries, along with the ants were detected certain insects—spring-tails, small white wood lice, and the larvæ of the click beetle. When ants of different species meet them in the galleries fierce fights ensue, but not so fierce as those which rage between separate colonies of the same species. A battle between two nests of Atta Barbara lasted, Mr. Moggridge affirms, forty-six days. A very graphic account of one of these conflicts (pp. 39-40) gives a good idea of the tenacity of the harvesters when

* *Harvesting Ants and Trapdoor Spiders: Notes and Observations on their Habits and Dwellings.* By J. Traherne Moggridge, F.L.S. London: Reeve & Co. 1873.

invaded by robbers of their own species. Such raids appear to be systematic, and the motive of them consists in the "struggle for existence" which is normal among ants, as in other communities, when the population is too large for its area:—

> It seems probable [writes Mr. Moggridge] that in warmer latitudes there are many conditions which favour the rapid increase of ants, so that a given tract of country in South Europe must have on an average more colonies to support than a like tract in the North, and that to meet this increase of population it has therefore become needful for these creatures to seek subsistence from many and dissimilar sources. The fierce conflicts over booty both between rival nests of the same and of distinct species tend to show that, even as things are, they frequently have to fight for food.

It is ascertained, *à propos* of this, that Atta Barbara and Atta Structor, though ordinarily feeding on grain and seeds, will, at least in times of scarcity, feed eagerly on animal food. A stirring tale is told of two medium-sized ants of the former species attacking a soft-bodied, smooth, greyish caterpillar:—

> When I first detected the group, the war was being waged in a tuft of grass over one of the entrances to the ants' nest, and the caterpillar was striding along the leaves or thrusting itself between the culms in the hope to shake off or brush away its little persecutors. From time to time it would viciously turn round and try to pluck away its assailants, but though it succeeded in stripping off by means of its fore legs and mouth five out of six legs of the ant which was within its reach, they never released their hold. At length a chance movement of mine shook the grass leaf on which they were, and ants and caterpillar rolled together down a rocky slope to about four feet distant. They tumbled over and over several times, but still the ants gripped their prey as firmly as ever. The last endeavour of the giant victim was to rub off the ants by burrowing into the soil, but on uncovering its retreat, I saw that their positions were still the same. After watching this struggle for twenty minutes I returned home, carrying with me however the combatants; and when on my return I opened the box in which they were imprisoned, these bull-dog ants were clinging with mandibles locked as firmly as ever, and now as I write, in death they are clinging still, drowned in a sea of spirits of wine.

An opportunity of observing the constructive and secretive skill of these ants, as well as of ascertaining their times of work and manner of feeding, was afforded to Mr. Moggridge by the capture of two colonies of Atta Barbara, which he kept in glass jars from autumn till the end of the following spring. In these they constructed their usual passages and chambers, working by night, and so organizing their gangs and parties that there was no clashing or confusion. The arrangements were complete in nineteen days, and then systematic trains began to carry down the seeds, which their captor had placed at hand, into the granaries. Although very shy of being watched, they had such an attraction towards light and warmth that they allowed his lamp to act as a spell, so that they could be watched at their meals. And such observation afforded proof that, though the ant has been thought capable only of lapping up liquids or soft tissues, its toothed mandibles enable it to scrape off particles of flour from seeds macerated and sprouting. The influence which the ants possess over germination did not fail them in captivity, and their work, at night and in the dark, corroborated Aristotle's statement in part, though they made no reservation, as his ants did, about a "full moon" as a *sine qua non*. Mr. Moggridge holds that Atta Barbara and Atta Structor, as well as perhaps two other species, do not store their seeds in the North of Europe, although they do in the South, the reason being that in the former wet would hinder the preservation of seed, and the torpidity which results from cold obviates the necessity for stores of food. Perhaps, too, as has been suggested, the excess of ant population in the South creates the need of such fresh sources of subsistence as seeds and seed stores.

Mr. Moggridge adds an interesting, and we might almost say romantic, account of trapdoor spiders, which construct nests that *close with a door*—nests which are to other nests, as the author enthusiastically remarks, "as the Mont Cenis Tunnel is to other tunnels." But we cannot follow him into the strange and curious details with which he illustrates this subject, and must content ourselves with referring the reader to his lively and agreeable book.

IN THE LAP OF FORTUNE.*

We have seldom met with a more unequal book than this. Parts of it are brisk, vigorous, lifelike, sustained; and parts of it again are vapid, languid, spun out, and threadbare. Towards the end especially the fatal sense of "want of copy" seems to steal like a mildew over the pages; and the interest of the plot as a whole suffers because of its double climax—one of the most unfortunate methods of telling a story that an author can adopt. We are puzzled too between *le vrai vrai* and *le faux vrai* in the circumstances which are said to have happened. We do not know how much is real and how much make-up; or whether, in spite of the apparent candour and circumstantiality of the "Introductory Chapter," the whole thing is not a myth after the manner of other novels. If so, the speciality of a true groundwork claimed for this story is only an ingenious way of giving it an air of truth by which the unwary may be entrapped to their discomfiture. Or it may be that a man was indeed murdered and hidden away in Mr. Hatton's boyhood as he describes, and that his father did "attend the inquest, and publish a plan of the deed, a map of murderous footsteps." In any case, however, Mr. Hatton would have done well to have made the gradual discovery of the criminal the principal *motif* of his book; and to have thrown more weight on the consequences to Magar and Johnston of the murder of Collinson than on the loves of Jacob and Lucy. The introductory chapter of which we spoke strikes the key-note of a sensational story of crime and mystery; and yet the book is only an ordinary love-story with a few ups and downs of fortune thrown in to add to its length, and to give it the right conventional stamp.

In the Lap of Fortune was published in a minor, or rather cruder, form some years ago; and it bears its date in that curious imitation of Mr. Dickens which it was the fashion for young authors to adopt when the anvil on which "Boz" had struck his fame was at its hottest. The description of Tom Titsy in the emphatic "rejoicing" of his face—"there was nothing but rejoicing from chin to forelock, he rejoiced in blue eyes, in a stumpy nose, in red cheeks, and in red hair"—would never have been written had not Mr. Dickens begun this reiterative and exaggerated kind of personal inventory. Titsy's house too, which had "evidently dropped from the clouds, or had been pitchforked from some other town into this particular corner of Middleton," the "round bulbous lump of stone, and thatch, and steps, and window-sills, and lichens," leaning against a friendly stable for support, betrays the source of the original sketch; and Silas Collinson, with his "brown curly hair, and brown curly whiskers, and a brown velvet shooting-coat to match," might have been one of the great master's smaller silhouettes. Mr. Hatton, again, makes play with the wind, like his model. When Collinson is murdered at the mill, and the poor fellow shrieks in his agony, "the very wind stopped as if to listen, and the river carried the awful sound down to the bridge and lost it among the dark arches. Time seemed to stand still for a moment, as if the night had received a sudden shock; and then the wind gathered strength, and rushed at the mill as if it were about to drag forth the heart of its mystery. It shook the doors and broke in upon a half-opened window. It came back again and plunged beneath the water-wheel"—and did a great many other things after the manner of wind handled by authors who are not sure of the line which separates sense from nonsense. At another time this same wind, which had "come for miles and miles over sea and land," blusters through three pages of copy. "It had rolled into foam the deep waters," with more seafaring circumstances than we care to extract. But one thing is slightly peculiar. When the "wise mariners who had caught the first sounds of its hoarse voice had sought shelter in creeks and bays," the wind had been "too proud and haughty to seek them out, though they tossed and trembled as the giant passed by in full cry." Also "it banged doors open," and like the nursery rhyme "frightened children into fits," "shouted down chimneys," and "bellowed round corners," and so on, till Mr. Martyn complained it made his head ache. But the wind did not care for his complaining, nor, if "ten thousand heads had ached," would it have "bated a jot of its rough humour." Part of this rough humour consisted in running away with men's caps, blowing the factory girls' petticoats over their heads, and knocking down boys who were opening their masters' shops, for all the world like the winds which Mr. Dickens was so fond of taking in hand. Tom Titsy's pretence of loosing a pigeon from his pocket when he has occasion to conceal his emotion, and the manner in which Squire Northcote jingles his gold and silver, and his gold and silver repeat his remarks, are Mr. Dickens again, to the life; and are really quite as good as, and no more strained than, very much of the greater prototype's work.

We will make a further list of objections, and then we will turn to the pleasanter task of praise. When Jacob Martyn is ruined, he acts like a coward and a fool; mooning about as a kind of modern Master of Ravenswood, with a bundle instead of a black cloak and plumed hat, indulging himself in sentimental melancholy rather than setting his shoulder to the wheel and meeting his difficulties like a man. Add to this an uncomfortable uncertainty as to what he has to live on, and why he does not at once try to get something to do, and we have reason to object to a method of treatment which leaves so much in obscurity, while what it does make manifest it does not render estimable. And would Miriam, the beautiful young gipsy queen, whose word was law in her camp, have married a cadaverous fugitive who was not a Romany at all? We know nothing personally of the people whose "patter" Mr. Hatton has transcribed, with what amount of accuracy we do not pretend to determine; but we always understood that they were as strict as the Jews and Hindus in their marriages, and that a gipsy queen would be as little likely to mix her pure blood with the muddy stream flowing in the veins of an ordinary Englishman as a daughter of Judah would be to make contract with a Gentile, or a high-caste Brahmin with a low-caste Sudra. Again, the description of Spenzonian, or Spen Whiffler, is difficult to realize. Humour which depends for its success on accent, voice, gestures, expression, always comes out tame, if not silly, in print; and both Spen and that extraordinary editor Windgate Williams are persons for the stage, not for a novel. We have seldom seen anything so extravagant as this latter gentleman; and for our own part we should hesitate to accept him as a sub., or even a penny-a-liner, not to speak of the responsible post of manager. He might have done for an editor of a paper in the Western States, but he would have been almost too extravagant for that. As an English pressman he is a caricature, and not specially amusing into the bargain.

These, then, being the faults of the book, the beauties are not to be ignored. The description of the garden on the day

---

* *In the Lap of Fortune: a story "Stranger than Fiction."* By Joseph Hatton, author of "The Valley of Poppies," "The Tallants of Barton," &c. 3 vols. London: Chapman & Hall. 1873.

of Jacob's convalescence is very pretty and tender; and the first love-making of the boy for the girl whose sweet song floating from the factory windows, and whose lovely face framed in the opening made by a couple of panes, had made him love before he knew the meaning of the word, is a true idyl of a very pure kind. And it is natural; which perhaps the conscious sentiment of the young lad was not. The sentiment of early youth is rarely, if ever, conscious. It exists as a state of feeling, and maturity and remembrance give it its right name; but at the time, while experience is still wanting, boys and girls have no knowledge of their own drift; and if they begin with so much sentiment as is ascribed to Jacob, they are likely to end with less manliness. When it comes, however, to confessed consciousness and intentional love-making, Mr. Hatton has drawn a pleasant little picture. The awkward and timid lad by the side of the more matured and self-possessed girl; his lack of words and her readiness; his asking for the sign of favour that was all the world to him, but such a disappointing and tame little folly to her; his over-sensitiveness fearing to offend, and her more womanly receptivity not unwilling to be offended—all this is admirably done. When we are reading about Jacob and Lucy in their young idyllic days we wish that Mr. Hatton had never tried to make himself a wag either with the wind or with such odd people as Spen Whiffler and Windgate Williams, but had confined himself to pictures where he understood his subject and was master of his material. That Lucy should have remained constant to Jacob Martyn in all the uncertainty in which she was plunged with regard to his faithfulness, and that she should have retained so much simplicity of nature as to prefer him and her lilac print frocks to all the wealth and fashion and luxury to which her sudden wealth introduced her, was highly creditable, if a little too good to be true. For either she was a lady by nature or she was not. If she was not, she could scarcely have learnt her part so quickly, and have played it to such perfection; working first as a factory girl, and then as a cottage maid-of-all-work, not being exactly the most likely school of manners whence would issue a well-bred young heiress capable of becoming the belle of the season, and desired in marriage by gentlemen of high degree albeit given to unseemly bets. And if she was naturally a gentlewoman, and therefore able to spring at one bound from her lower past to her higher present, then she would have fitted herself into her new circumstances with more real congeniality than we find; and she would not have suffered herself to yearn after the boy who could neither adorn nor strengthen her new sphere. Her ladyhood of bearing and education seems to us to come a little too suddenly, and to be also a little too uncertain. The whole platform is raised with too quick a jerk; but Lucy's constancy is so pretty that we may forgive the unlikely circumstances attending it. We wish, however, that *In the Lap of Fortune* had been more equal in strength; that it had not been disfigured by the patent imitation we have pointed out; and that the end had been more in harmony with the beginning. It was a good idea, but it might have been better wrought; and Mr. Hatton has used up in one book the ground-plan of two, without giving his readers a sense of richness, but only one of a certain poverty of method which needed an extra allowance of material to make up the necessary amount.

GERMAN LITERATURE.

THE preparation of a selection from the correspondence of the late King of Prussia with his confidant, and in not a few respects counterpart, Baron Bunsen *, is a task very fitly entrusted to the approved circumspection of Leopold von Ranke. Few royal correspondents can have habitually allowed themselves more latitude of expression than Frederick William IV., and it is sufficiently apparent that any approach to a publication of the letters in their entirety would have created a tempest of scandal in political and diplomatic circles. The selection, as we have it, serves to illustrate the extreme vivacity of the monarch's temperament, amounting at times to an entire failure of discretion and self-command, and at the same time to redeem in some measure his character for consistency by indicating certain lines of policy to which, amid all apparent vacillations, he persistently adhered. It is only to be deplored that these cherished maxims were usually unsound, and were indeed but modifications of his one paramount idea of the divine right of princes, which appears and reappears throughout the correspondence in every variety of shape. It actuated his memorable refusal, contrary to Bunsen's earnest solicitations, to accept the tender of the German Imperial Crown in 1848, inasmuch as the offer came from the representatives of the people instead of from the sovereigns who alone were in his eyes entitled to make it. The same first principle is particularly apparent in his communications respecting the insignificant Neufchâtel affair, which, in Von Ranke's opinion, finally caused the overthrow of reason which preceded his death. Frederick William would sooner have lost entire provinces to a monarchy than have transferred, as he was in this instance compelled to do, a handful of faithful liege to the jurisdiction of a republic—the negation, as he deemed it, of the one divine pattern of government. The habitual violence of his expressions in speaking of democracy and democrats in general is almost incredible; few men of equal refinement of taste and intellectual ability would have exhibited themselves in so thoroughly undignified a light. On the other hand, the very vehemence of his antipathies occasionally forced him upon sound ideas, although these are seldom placed upon the right basis. We find him, for example, deeply impressed with the importance of the English alliance; but only in the chimerical expectation of imposing with its aid a check upon the progress of Liberal views upon the Continent. With all his seeming instability, he clung tenaciously to this project, and might not improbably have shaken off his dependence upon Russia during the Crimean War had it been possible for England to afford him any encouragement. The plan towards which the Jerusalem Bishopric was to have been the first step was also never abandoned; he aimed, to the last, at importing a more sacerdotal element into the Prussian Church, after the pattern of the English, and at putting the Holy Places under a general protectorate of the great Christian Powers. Bunsen, whose intellect had not a little in common with his master's, appears, so far as we can conjecture from the tenor of the King's references to his letters, in the character of a moderator, and not a very successful one. The sympathy between the two was evidently most complete at the beginning of their official relations; Bunsen's mind, disciplined, it may be suspected, by daily intercourse with English statesmen, growing steadily in width and candour, while the King becomes continually more mystical, quixotic, and vituperative. A decided change for the worse is apparent after the events of 1848. On the whole, Strauss's character of him as the personification of the Romantic school upon the throne seems fair enough, though we must demur to the implied parallel between him and the statesman and warrior, if enthusiast, Julian. The resemblance to Charles I. is far more apparent. The correspondence, which has evidently been edited with extreme discretion, is divided into twelve sections, the most important of which are those respectively relating to the Jerusalem Bishopric, the events of 1848, the offer of the Imperial Crown, the Eastern question, and the affairs of Neufchâtel.

Theodor Fontane *, the historiographer in general of contemporary wars, produces a popular history of the recent great struggle which fulfils all reasonable requirements from books of this description; the narrative being ample, the illustrations copious and excellent, and the whole pervaded by a spirit of moderation and fairness not always to be found in works of the kind prepared for domestic consumption by a patriotic public. Without any imposing literary pretensions, the book is fairly written, and, without being unduly technical, shows a competent knowledge of the strategic department of the subject. The first part comes down to the battle of Gravelotte.

Professor Held's little work on the industrial press of Germany † contains a useful account of the principal newspapers and other periodicals devoted to the discussion of questions affecting the interests of artisans, from the organs of the International to merely technical publications. The author belongs to the school known in Germany as that of Academic Socialism, which occupies a middle position between the strictly socialistic and the Manchester school, being distinguished from the former by its repudiation of communism, and from the latter by its hostility to the principle of *laissez-faire*. The State, it contends, should interfere by means of legislation, and its legislation should encourage trade unions, tribunals of arbitration, and the co-operative principle. Professor Held considers that trade unions may be made to afford a valuable barrier against the destructive doctrines of the International; he favours co-operation for the same reason, and as tending to thin the ranks of the proletariat. His school is vigorously attacked by Herr L. Bamberger ‡, a lawyer apparently, and a disciple of the orthodox school in political economy. Bamberger taunts the Academic Socialists with encountering the social question without a social answer, maintains the *laissez-faire* principle unconditionally, and is compelled in consistency to extend it to combinations among workmen, which he would evidently be glad to suppress if he could see his way. His book is based to a considerable extent on the Report of the English Parliamentary Committee; the appendix contains the statutes of some German trade societies, and other interesting documents.

The influence of Richard Rothe § on the development of German theology promises to be far more considerable than might have been anticipated in the case of a divine whose learning, though remarkable, did not transcend the high standard of his country, the catholicity of whose sympathies unfitted him for party leadership, and whose modest and diffident character inclined him to remain in the background. The important position he obtained in his latter years is mainly attributable to his character as a connecting link between the great conservative school of theology which arose in Germany after the War of Liberation, represented by Neander, Olshausen, and kindred spirits, and the modern critical school of which Schenkel, Holzmann, and Weizsäcker are types. Uniting the profound religious feeling of the first

to the scientific spirit of the second, he represented each on its best side, and facilitated the inevitable transition from the first, now well nigh exhausted, to the second, scarcely as yet in the full tide of activity. The present extremely interesting biography, based upon authentic details and a mass of correspondence, enables us to trace Rothe's mental history with much precision. It may almost be said to express in miniature the history of the last half-century of German theology. In his youth the emotional element is naturally most developed; we find him under strong pietistic influences, narrow, passionate, mystical, and writing of other schools of thought in a style which reminds us not a little of the deliverances of the early Tractarians in such books as Froude's *Remains*. But his gentle spirit was incapable of long retaining this pugnacious attitude; a period of religious melancholy supervened, then a healthy reaction, greatly promoted by a residence at Rome, which effectually cured him of any Catholicizing tendencies. In his capacity of chaplain to the Prussian Embassy at Rome he was brought into intimate relations with Bunsen, whose influence appears to have been thoroughly wholesome. We part with him at the close of this volume on his return to Germany preparing to enter upon the course which imperceptibly, and as it were in his own despite, made him ultimately the leader of the most important of those schools in thought in Germany whose labours are strictly confined to the field of theology. The biography, which is composed in a spirit of perfect appreciation, contains many incidental notices of other remarkable personages, such as Bunsen, Jean Paul, and Hegel.

Dr. Paul de Lagarde *, in a pamphlet composed in a dry, precise, quaint, and yet telling style, insists upon the unscientific character of German theology, evinced, according to him, by the contradictions among the twenty-five existing theological faculties. The remedy proposed, so far as we can understand, is the suppression of them all, and the organization of theological instruction upon a new basis. Combined with this are suggestions for a much more extensive innovation in the prevailing views on these subjects, the precise purport of which remains somewhat obscure, notwithstanding the terseness of the author's style. His brevity, an excellent property in itself, is carried to such a length as to be a positive disadvantage; he has manifestly made his subject clear to himself, but has forgotten that it may not be equally so to unprepared readers.

It is rather a begging of the question for O. F. Gruppe † to entitle his work on the supposed interpolations in the works of the Latin poets—a question, even if fairly mooted, still at best *sub judice*—after the infallible and incorruptible judge of the nether world. To us the title appears a downright libel upon Aeacus, as implying that he was accustomed to pass sentence upon the strength of his own subjective impressions respecting the delinquent's physiognomy, without the slightest heed of the sworn testimony in the case. Such is literally the method of Herr Gruppe, whose sole canon of evidence is his own æsthetic feeling, and whose chief standard of poetical excellence is conciseness of expression. It is enough for him that any poem, from a satire or epistle down to the simplest ode, should be capable of abbreviation without material injury to the sense; everything not strictly essential is at once stigmatized as an interpolation; the oldest MSS. become waste parchment; and the herd of ordinary commentators flee in affright, leaving Messrs. Gruppe, Lehrs, and Peerlkamp wrangling over the wretched bard's mutilated remains. We shall not dispute that Herr Gruppe has in a few instances shown that Horace might have written better if he had written more concisely, but that is quite a different thing from proving that Horace always wrote as concisely as he might have done. In the majority of cases, however, there appears positively no ground for his suspicions; where there is any appearance of such, it usually rests on the silent assumption of an obvious fallacy, that the course of thought of a classic poet, whose writings must be full of allusions rendered unintelligible by time, should be as clear to us as to his contemporaries. He finds fault, for instance, with an apparently unseasonable allusion to a compliant Myrtale at the end of the ode addressed to Tibullus; how does he know that Myrtale was not at the poet's elbow when he wrote? We find also the usual minor fallacies of hypercriticism, such as denying Horace the right to take metrical liberties, and stumbling at a word which he happens to have only used once, as though he were under any obligation to use it oftener than he wanted it. At the utmost this subjective criticism can demonstrate nothing except the validity of the maxim *de gustibus;* the question is really one of external evidence, and here Herr Gruppe's case completely breaks down. The incriminated passages, it is palpable from the Latinity, could not have been forged long after the age of Augustus; and Gruppe himself admits that passages regarded by him as spurious are quoted by Martial, and even by Seneca. We should then have to assume that the writings of one of the most popular poets of his day were, without any assignable motive, disfigured by enormous interpolations within half a century after his death, and that these interpolations beguiled the credulity and eluded the notice of contemporaries with the genuine copies in their own libraries. The absurdity of the supposition needs no comment.

From the uncultivated condition, as is to be supposed, of the language, the German Renaissance * has left few traces of itself except in the domain of art. Here the fusion of the peculiar and well-marked type of national character with exotic elements has produced a very distinguishable style of performance, an excellent idea of which may be obtained from the descriptions and illustrations of Herr Lübke, the first part of whose work on the subject we have already noticed with commendation.

Wilhelm König's † account of the circumstances which led to the composition of his work on Shakspeare brings to mind the pertinent inquiry in the *Tempest*:—

> Would they believe me
> If I should say, I saw such islanders?

We are fairly at a loss to determine whether his alleged shipwreck among the anthropophagous Nororis and escape with his Shakspeare in his pocket to the milder yet not wholly unobjectionable Mepongwehs, is to be accepted as autobiography or as allegory. It is more to the purpose to be able to describe him as a pleasing and judicious, if not a powerful or very original, critic. The three of Shakspeare's plays most immediately connected with moral and social problems—*Hamlet*, the *Merchant of Venice*, and *Measure for Measure*—are selected as his main theme, to which are appended an agreeable essay on *As You Like It*, as a type of the idyllic drama, and an enumeration of the faint resemblances which may be dubiously traced between Shakspeare and the most remote of all great poets from his style and spirit—Dante.

The European reputation which "Gregor Samarow" ‡ has undoubtedly managed to acquire by an indifferent novel must be accepted as an illustration of the general love of gossip, no less striking than that afforded by the book itself, admitting its contents to be really authentic, of the *quantula sapientia regitur mundus*. The identification of the author with an ex-secretary of the King of Hanover has naturally directed considerable attention to the incidents and conversations of his fiction, in so far as they have a bearing on the downfall of the Hanoverian kingdom. It is probable that they actually contain authentic information on this head, the value of which, however, is much impaired by the form in which the author has chosen to impart it. Acquaintance with the secrets of Hanoverian policy does not involve a corresponding familiarity with the mysteries of the great Cabinets of Europe. We find little respecting these that Herr Meding might not have learned or surmised from the journals or from State papers; while his artistic presentation of it is so heavy, tasteless, and spiritless, that nothing save the anticipation of surprising a State secret could nerve an average reader to face its intolerable tedium. The indelicacy of reporting the confidential conversations of living persons, if they are genuine, needs as little comment as the silliness of the proceeding, if they are not. If rulers and statesmen are to be brought on the stage, they might at least be spared the humiliation of being made to talk like so many Herr Medings. We should attach no value to the book, except as regards the light it may possibly throw on the proceedings of the ex-King of Hanover, a subject hardly worth illuminating at this time of day. The continuation, "Mines and Countermines," is even more vapid than the original, and affects us with a much stronger impression of unreality.

Paul Heyse's "Children of the World" § is a very different kind of novel, and is quite as successful as can be expected in a long romance from the pen of a writer whose forte consists in the artistic manipulation of single incidents. It has hitherto been his plan to select from the great stage of human life such individualized groups as admitted of ready severance from the rest, such incidents and miniature histories as, complete in themselves, allowed dramatic treatment on a restricted scale. The representation of a throng of personages is something new to him, and, as might be expected, the picture has rather the air of a mosaic formed by the dexterous junction of portions originally distinct. Each section, however, is perfectly well executed in itself, and the whole is at least a succession of very pleasing studies of cultivated German society. Not, indeed, that the action moves throughout in the highest circles, but Herr Heyse, a pupil of Goethe's, is too thoroughly steeped in culture to be able to divest himself of urbanity for a moment, and his roughest characters wear a semblance of extreme refinement. The various incidents of the book are strung upon the adventures of a young professor, possessed of more character than the heroes of modern novels in general, and interesting as a carefully studied type of his class. Some of the episodes have an air of actuality; at the conclusion Strauss's recent work is unmistakably alluded to. The subordinate personages are well drawn, and in some instances typical, such as the simple-minded old painter, the literary princess, and the sanctimonious candidate in theology. The principal female personages, as is usual with Heyse, enlist sympathy from the strength of their affections, and exhibit various phases of the emotional type. On the whole, the romance wants none of the recommendations of the author's novelettes except their unity of structure. The style, as usual, is perfect.

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 916, MAY 17, 1873:

Italy. Mr. Stansfeld on Boundaries.
Mr. O'Keeffe and the House of Commons. Russian Policy in Asia.
M. Thiers and the Right. Mr. Mill. The Lord Chancellor's Land Bill.
Republicanism at Birmingham.

Extravagance.
The Early Days of the Vienna Exhibition. Emanuel Hospital.
Merchant Ships and Seamen. The Visitation of the Chapter of Lincoln.
The West Coast of Africa. Starring in the Pulpit. The Law of Games.
The Royal Academy. Newmarket Second Spring Meeting.

The Yellowstone Basin.
Lord Houghton's Monographs. The Cruise of the *Rosario*.
Poems of Sir David Lyndesay. Getting on in the World. Ober-Ammergau.
Moggridge's Ants and Spiders. In the Lap of Fortune.
German Literature.

CONTENTS OF No. 915, MAY 10, 1873:

The Imperial Meeting at St. Petersburg—Mr. Stansfeld's Proposals—Bath and Gloucester Elections—French Prospects—Sir Charles Dilke's Motion—Judicial Peerages—The Debate on the Permissive Bill—Debtors and Charity—Andrews v. Salt.

Alphonse's Wish—Fellowships and Liberal Education—The *Times* and the Artists—City Churches—Couriers for Vienna Asylum Management—The Grocers Again—Religious Affairs in Germany—The Royal Academy—*Hamlet* at the Crystal Palace.

Dr. Mansel—The Pains of Memory—The Fortescue Papers—Old Kensington Slave-Catching in the Indian Ocean—The Military Strength of Russia—*La Femme de Claude*—Newmarket and Arabia—Cyllene.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

CRYSTAL PALACE.—PARTICULAR ATTRACTIONS.
THIS DAY and NEXT WEEK.
Saturday (May 17)—Great Flower Show, open at 12; performance (once) of "The Happy Land," at 3.
Tuesday—Opera, "Lily of Killarney," at 3.
Thursday—Opera, "Robin Hood," at 3.
Saturday—Grand Summer Concert, at 3.
The Fine Arts Courts and Collections, the Technological and Natural History Collections, all the various Illustrations of Art, Science, and Nature, and the Gardens and Park always open. Music and Fountains daily.
Admission, Monday to Friday, 1s.; Saturday (May 17), 7s. 6d.; Saturday (May 24), 5s. Guinea Season Ticket free.

ALEXANDRA PALACE.—ALEXANDRA PALACE and PARK will be OPENED on Saturday, May 24, on which occasion there will be a GRAND CONCERT, under the direction of Sir MICHAEL COSTA, at which the following distinguished Artistes will assist: Madlle. Titiens, Natalie Carola, Madame Trebelli-Bettini, Signor Campanini, Signor Borella, and Signor Agnesi. Full Band and Chorus. One Thousand Performers. Organist, Mr. Frederic Archer.
The GREAT INTERNATIONAL FLOWER SHOW, at which Twelve Hundred Pounds will be given in Prizes.
Admission, by Tickets purchased before the Day, Five Shillings; by Payment at the Doors, Seven Shillings and Sixpence. Season Tickets admit to the Opening Festival. Season Tickets, One Guinea, are now ready. Each holder of a Guinea Ticket will receive a Share in the Alexandra Palace Art Union. Five Shillings of each Guinea will be set aside to form a Fund for the purchase of Pictures and Works of Art, to be drawn for annually in May.

ALEXANDRA PALACE.—The Station which adjoins the Palace places it in communication with King's Cross and Great Northern Stations, Moorgate Street and Metropolitan Stations, and Victoria and London, Chatham, and Dover Stations. The Palace is five miles from King's Cross, and is within an easy and pleasant drive from Charing Cross and the West End.

ALEXANDRA PALACE.—A GRAND ORGAN, which is one of the largest and most perfect Instruments in England; a spacious CONCERT HALL, capable of seating 9,000 Visitors; and a THEATRE, the stage of which is fitted with every modern improvement, and is about the same size as that of Drury Lane, will be found in the Palace.
THE REFRESHMENT CONTRACTORS are Messrs. BERTRAM & ROBERTS.
Arrangements have been made for numerous first-class FÊTES and CONCERTS, particulars of which will be announced from time to time.

MUSICAL UNION.—JAELL with VIEUXTEMPS, expressly from Paris.—Tuesday, May 20.—Pianoforte Quintet, Op. 114, Schubert; Quartet in C, with Fugue, Beethoven; Variations for Piano and Violoncello in D, Mozart; Aria and Gavotte, Violin, Vieuxtemps; Piano Solos, Heller, Chopin, Schumann, by Jaell. Tickets for Three, One Guinea, and Single Admissions, payable at the Hall to Austin, Ticket-Taker, Half-a-Guinea.
J. ELLA, Director.

MR. SIMS REEVES has the honour to announce that, having completely recovered from his recent severe indisposition, his ANNUAL BENEFIT CONCERT will be given at St. James's Hall, on Tuesday Evening, May 27, when the following Artists will appear: Madame Sherrington, Miss Helen Dalton, and Madame Otto Alvsleben; Mr. Sims Reeves, Mr. Pyatt, and Mr. Santley. Pianoforte, Mr. Charles Hallé. Orchestral combination: Messrs. Lafjeune. Conductors: Messrs. Blumenthal, Rocckel, Meyer Lutz, and Arthur Sullivan.—Stalls, 10s. 6d.; Reserved Seats, 5s.; Balcony Stalls, 5s.; Balcony, 3s.; Admission, 1s. and 2s. Tickets to be had of Austin, St. James's Hall; Chappell & Co., New Bond Street; Keith, Prowse, & Co., Cheapside; Hay's, Royal Exchange Buildings; and Boosey & Co., Holles Street.

MR. SIMS REEVES'S BENEFIT CONCERT.—On this occasion Mr. Sims Reeves will sing, with Mr. Santley, the celebrated duet, "The Lord is a Man of War," from Handel's Oratorio "Israel in Egypt."—Tickets at Boosey & Co.

THE SOCIETY of PAINTERS in WATER-COLOURS.—The SIXTY-NINTH ANNUAL EXHIBITION is now OPEN, 5 Pall Mall East, from Nine till Seven. Admittance, 1s. Catalogue, 6d.
ALFRED D. FRIPP, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Triumph of Christianity," "Christian Martyrs," "Francesca da Rimini," "Neophyte," "Andromeda," &c., at the DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

PICTURES in the LOUVRE GALLERY.—ON VIEW, a Collection of fine AUTOTYPE PRINTS from the principal *chefs-d'œuvre* in this celebrated Collection.—AUTOTYPE GRAND FINE ART GALLERY, 36 Rathbone Place (Next door to Winsor & Newton's).

BRITISH MUSEUM.—From the present date until August 16, inclusive, VISITORS will be admitted to VIEW the COLLECTIONS on Mondays from Ten till Eight o'clock, on Wednesdays and Fridays from Ten till Six o'clock, and on Saturdays from Twelve till Eight o'clock. During the remainder of August, on Mondays, Wednesdays, and Fridays from Ten till Six o'clock, and on Saturdays from Twelve till Six o'clock.
J. WINTER JONES, *Principal Librarian.*
British Museum, May 9, 1873.

ROYAL LITERARY FUND.—The EIGHTY-FOURTH ANNIVERSARY DINNER of the Corporation will take place in Freemasons' Hall, on Wednesday, May 28.
The Right Hon. W. E. GLADSTONE, M.P., in the Chair.
First List of Stewards.

The Earl of Aberdeen.
His Grace the Duke of Argyll, K.T.
Francis Bennoch, Esq., F.S.A.
George Bentley, Esq.
Hayle Bernard, Esq.
Rev. Dr. Binney.
The Lord Blachford.
Henry W. F. Bolckow, Esq., M.P.
William Bowman, Esq., F.R.S.
Robert Broadwater, Esq., F.H.G.S.
Right Hon. H. A. Bruce, M.P.
Benjamin Bond Cabbell, Esq., M.A., F.R.S.
Right Hon. Sir James W. Colvile.
The Hon. Henry Cowper, M.P.
Dr. Dasent, D.C.L.
His Grace the Duke of Devonshire, K.G.
Rev. Robinson Duckworth, M.A.
Captain F. Duncan, R.A.
The Very Rev. the Dean of Durham.
Viscount Enfield, M.P.
Sir William Fairbairn, Bart., F.R.S.
Right Hon. Chichester Fortescue, M.P.
George Godwin, Esq., F.R.S.
Right Hon. G. J. Goschen, M.P.
Charles Grinwade, Esq.
Right Hon. Sir James Hannen.
Henry Irving, Esq.
Sir Walter C. James, Bart., M.A.
Henry James, Esq., Q.C. M.P.
John Winter Jones, Esq., F.S.A.
Samuel Laing, Esq., M.P.
Lionel Lawson, Esq.
John Leighton, Esq., F.S.A.
Edward Levy, Esq.
John Delaware Lewis, Esq., M.P., M.A.
The Very Rev. the Dean of Lincoln.
The Lord Lisgar.
Professor Macfagan, M.D., F.R.S.E.
Lieutenant S. Maurice, R.A.
Right Hon. William Monsell, M.P.
Junius S. Morgan, Esq.
Samuel Morley, Esq., M.P.
Kenneth R. Murchison, Esq.
The Lord Napier and Ettrick.
The Earl of Normanton.
Frederick Ouvry, Esq., F.S.A.
Love Jones-Parry, Esq., M.P.
John Pender, Esq., M.P.
Mr. Sheriff Perkins.
Jonathan Pim, Esq., M.P.
Thomas Henry Allen Poynder, Esq., M.A.
Baron De Reuter.
Edmund Routledge, Esq.
Lord Arthur Russell, M.P.
Sir Titus Salt, Bart.
Alfred Smee, Esq., F.R.S.
Samuel Spalding, Esq.
Right Hon. the Speaker.
William Stevens, Esq.
Russell Sturgis, Esq.
Tom Taylor, Esq., M.A.
Colonel Meadows Taylor, C.S.I.
The Lord Tenterden.
Anthony Trollope, Esq.
His Excellency M. Van de Weyer.
John Walter, Esq., M.P.
Sir Joseph Whitworth, Bart., D.C.L.
Rev. Canon Westcott, D.D.
W. G. Wills, Esq.
The Lord Bishop of Winchester.

Dinner at Half-past 6 for 7 precisely, at which hour the Chair will be taken.
10 John Street, Adelphi, W.C.
OCTAVIAN BLEWITT, *Secretary.*

ARTISTS' BENEVOLENT FUND.—Incorporated by Royal Charter, for the Relief of the Widows and Orphans of British Artists.
Patron—Her Majesty the QUEEN.
The SIXTY-FOURTH ANNIVERSARY DINNER of the Corporation will be held in Freemasons' Hall, Great Queen Street, on Saturday, May 31, the Very Reverend the Dean of WESTMINSTER in the Chair. Since the foundation of the Society the sum of £35,747 10s. has been distributed in relieving the Widows and Orphans of British Artists, and during the past year fifty Widows and fifteen Orphans have received Annuities amounting to £1,621 10s. The Institution is entirely supported by the Voluntary Donations and Subscriptions of the Patrons of the Fine Arts.
Artists' and Gentlemen's Tickets, 21s., and Ladies' Tickets, 12s. 6d., may be obtained of the Stewards at the Bar of the Freemasons' Tavern, and of the Secretary, Mr. L. YOUNG, 4 Trafalgar Square, W.C.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.—Incorporated by Royal Charter 1853, for the General Education of Ladies, and for granting Certificates of Knowledge. The Half-term for the College and School will begin on Monday next, the 19th inst.
E. H. PLUMPTRE, M.A., *Dean.*

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.—A SPECIAL COURSE of FOUR LECTURES on the "History of Modern Music" will be given by Mr. JULLIEN, Professor of Harmony and Vocal Music, on Wednesdays, the 21st and the 28th inst., and June 11 and 18, at 4 P.M. Fee for the Course, 10s.
E. H. PLUMPTRE, M.A., *Dean.*

INDIA CIVIL SERVICE.—The following are the SUCCESSFUL CANDIDATES at the recent Open Competition for the Civil Service of India:—

In order of Merit.	NAME.	Total No. of Marks.
*1.	Wilson, J.	1,780
*2.	Macleane, W. A.	1,757
*3.	Merk, W. R. H.	1,723
*4.	Finlay, J. F.	1,716
*5.	Phayre, R.	1,547
*6.	Staley, A. E.	1,525
*7.	Russell, W.	1,413
*8.	Mackay, D. L. M.	1,393
9.	Hughes, G.	1,326
10.	Hewson, F. T.	1,285
11.	Fuller, J. B.	1,228
*12.	Symes, E. S.	1,210
*13.	Maclean, J. J.	1,207
	Taylor,	1,207
15.	Wells, W. F. W.	1,200
16.	Pennington, H. F. D.	1,193
17.	Dé, B.	1,191
18.	Pargiter, F. E.	1,178

In order of Merit.	NAME.	Total No. of Marks.
19.	Place, G. W.	1,173
20.	Farrer, H.	1,167
21.	Thornton, W. M.	1,164
*22.	Mitchell, T. G.	1,159
*23.	Bonjger, G. S.	1,156
24.	Martindale, A. H. T.	1,136
25.	Marriott, C. R.	1,127
*26.	Primrose, A. J.	1,120
*27.	Anderson, J. D.	1,120
28.	O'Farrell, H. H.	1,117
*29.	Ritchie, J. C.	1,101
30.	Peterson, H. F.	1,118
*31.	Hebbert, F. H.	1,117
32.	Rees, J. D.	1,115
33.	Fiddian, J. P.	1,109
34.	Tremenheere, J. H. A.	1,098
35.	Power, G. F. T.	1,094

* Pupils of Mr. WREN, 3 Powys Square, W.—Address, 113 Piccadilly, Corner of Dover Street.

FRENCH.—Conversation, Reading, Special LESSONS on Pronunciation—Translation—Correspondence, by Dr. CLAUDON, Parisian, 443 Strand (Opposite the Charing Cross Station). Dr. CLAUDON is M.D. of Paris, and M.R.C.S. of England, and has had ten years' successful experience in Teaching. List of references sent free.

PICTURES, BRONZES, and WORKS of ART on SALE at 20 Southampton Street, Strand. Pictures Cleaned, Lined, and Restored, if in the worst condition. Frames Cleaned or Regilt equal to New. Sales attended on Commission.
CHARLES DEAR, 20 Southampton Street, Strand.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 917, Vol. 35. May 24, 1873. [Registered for Transmission abroad.] Price 6d.

THE CRISIS IN THE FRENCH ASSEMBLY.

M. THIERS has met the Assembly on its return after the holidays with a homogeneous Cabinet and a complete Constitution. M. DE GOULARD and M. JULES SIMON have both been dismissed, and neither the Right nor the Left have any longer a representative in the Ministry. M. THIERS has made up his mind to lean wholly on the Centres; but as the Right Centre refuses to be leant upon, the genuine supporters of the Government are reduced to the Left Centre. The new Ministers are all taken from a section within a section. M. CASIMIR PÉRIER and his friends parted company some time ago from the Left Centre, from distrust of its too great friendliness towards the Left, and constructed a group of their own under the title of the Conservative Republicans. It seems hard that politicians who found the mild-spoken Left Centre too Radical should be accused, immediately on taking office, of not appreciating the necessity of rendering a resolutely Conservative policy predominant in the government of the country. What other policy, it might fairly be asked, is to be expected of a Cabinet in which M. CASIMIR PÉRIER and M. DUFAURE are the leading spirits? The language of the interpellation proposed by all fractions of the Right shows the greatness of the change which their views have undergone in the course of the last few months. Discouragement out of doors has given them increased boldness in the Assembly. So long as there was any hope that the country might be conciliated, and that the majority elected amidst the panic and disorganization of February 1871 might be sent back to Versailles by the deliberate and conscious act of the constituencies, the Right could find soft things to say of the Republic. It was not, they declared, the Republic they hated, nor even all Republicans; it was only the particular Republicans who make up the Left in the Chamber. If M. THIERS would distinctly separate himself from the Radicals, get rid of M. JULES SIMON, and give France Conservative institutions, they had no wish to give effect to their monarchical sympathies or to take the Government out of his hands. After, it must be confessed, a sufficiently long interval, M. THIERS has taken them at their word. He has done the very thing which, in the days when they still thought it worth while to temporize, they used to say would give them confidence in his policy. There is not a suspicion of Radicalism in the new Ministry; there is a fine Conservative flavour about the proposed Constitution. But the concession which has come so late is no longer regarded as a concession. The Right have probably forgotten that there ever was a time when, according to their own professions, it ought to have satisfied them. They still cling to the old phrases; they do not demand in words that the Republic shall give place to a Monarchy; they simply ask for a Cabinet whose firmness will reassure the country, and introduce a resolutely Conservative policy into the Government. But the whole spirit of their demand has changed. To insist by an interpellation upon the necessity of a Conservative policy is to imply that the policy actually adopted by the Government is not Conservative. It is only on one supposition that this can be truly said in the present case. If Conservatism and Monarchy are interchangeable terms, and there can be no Conservatism under a Republic, M. THIERS's policy is not Conservative. On any other hypothesis it is Conservative to the last degree. Consequently when the Right go on asking for what has already been given, it is clear that they are really asking for something different, though they choose to call it by the same name. They want a Republic with the Duke of AUMALE for its President and Marshal MACMAHON for its Protector, and they want it because they know that such a Republic would be simply an ante-room to Monarchy. This is the only Conservatism that they genuinely care for. A Conservative Republic is in their eyes no better than any other Republic; it has only appropriated a title which can never truly belong to it, and which does not in the least describe its character. Nothing probably but the fears of the more timid members prevents the majority from frankly stating this view in the Assembly. But the sense in which they use the word Conservative is so well known that their meaning could hardly be clearer if they had proclaimed the Count of CHAMBORD King.

By reconstructing his Cabinet, and introducing the Bill on the organization of public powers, M. THIERS has shown that he does not yet despair of keeping the Assembly under his control. He has so often obtained a majority under the most unpromising circumstances, that it would be exceedingly unsafe to predict that he will fail to do so again. But the danger against which he has now to contend is more serious than any he has yet encountered. In his former struggles with the Right the secret of his strength has been the terror which his adversaries have felt at the thought of being left to themselves. The threat of resignation has invariably brought them to their senses. They have unwillingly recognized, whenever it came to the point of taking decisive action, that M. THIERS was a necessity. It is possible, of course, that they are secretly of this opinion still. They have blustered a good deal more than usual, but nevertheless it may be only bluster. If so, M. THIERS will at the last moment either have a majority of votes on his side, or be able even after defeat to make his own terms with the conquerors. It seems more probable, however, that the Right have at length brought themselves to the point of doing without M. THIERS. They have studied public opinion to very little purpose if they do not see that their only chance of establishing themselves in power is to use, and use promptly, the interval secured them by the continuance of the present Assembly. They will be nowhere after a general election: they will be nowhere even before a general election if they wait for many more partial elections. It is plain that they cannot turn this interval to any account so long as M. THIERS remains at the head of affairs. While he retains his authority the Republic will continue to exist, and if the Republic continues to exist until after a new Assembly has been elected, the last hope of the monarchical party will be gone. Perhaps the most convenient thing that could happen to the Right at this moment would be M. THIERS's death, since the Assembly would then be the only legitimate power in the country, and as such would have the right to nominate a new President. But as assassination has ceased to be fashionable, M. THIERS can only be got out of the way by a vote of want of confidence, and on the whole the Right seem to intend their interpellation to be taken in this sense. They must foresee considerable difficulty in getting the Duke of AUMALE to accept the post, but they probably count on making much of the imminent danger of anarchy if the country is left without a head, and on overcoming by this means any inconvenient reluctance on his part. If, therefore, their courage does not fail them at the last moment—it is quite possible that it may fail them after all—they may be expected to carry the interpellation with the undisguised intention of overturning the Government and abiding the consequences.

It is by no means certain, however, that in this instance their victory will have the effect which they design it to have. M. THIERS was prodigal of threats of resignation when he felt sure that the moment after he would be implored to take back his power. It does not follow that he will be equally prodigal of them when he expects to be taken at his word. Supposing that the interpellation is adopted,

the majority of the Assembly will have put on record their conviction that the gravity of the political situation requires at the head of affairs a Cabinet whose firmness will reassure the country. Of course, if M. THIERS accepts this as a direction to retire from office, the majority will have the opportunity of putting at the head of affairs not a Cabinet only, but a President, whose firmness will have the desired effect. But supposing that M. THIERS takes no notice of the interpellation after it has been passed, it is not at all clear that the majority have any means of compelling him to take notice of it. A vote of want of confidence is a serious thing to a statesman if it is supported by public opinion out of doors. But when public opinion out of doors is notoriously hostile to the vote, and when its authors dare not appeal to the country to confirm it, it may be nothing very tremendous after all. M. THIERS might have been better advised if he had adopted a policy of doing nothing in preference to that policy of excessive activity which seems to be foreshadowed by his Bill on the organization of public powers. He cannot compel the Assembly to dissolve itself, but he might have virtually refused to acknowledge it as a Legislature by providing it with nothing about which to legislate. He has preferred to try once more whether the Assembly cannot be made to serve his purpose; but if it fails to do so, there seems to be no reason why he should not do at last what it was open to him to do at first. M. THIERS may in the end do as much harm to the Right by assuming an attitude of passive resistance as by any manifestation of open hostility.

THE VIENNA PANIC.

A FINANCIAL panic has unexpectedly clouded the commencement of a festive season at Vienna. While the EMPEROR and his princely guests celebrated the opening of the Exhibition, traders and bankers were struggling to avert sudden ruin; and the Government was compelled to intervene for the relief of the money market by authorizing an additional issue of paper currency. The range of a monetary crisis at Vienna must be far narrower than in London. The difficulty of obtaining discount chiefly concerns traders who conduct their business on credit; and at Vienna the panic seems for the present to have been confined to the Stock Exchange and the money market. The general community may escape any share in the calamity, unless the paper currency is depreciated. The most complicated machines are also the most delicate; and the commercial system of Austria is comparatively simple. On the other hand, the political constitution of the monarchy is highly artificial; and the Austrian Ministry was compelled to obtain the consent of the Hungarian members of the Delegation to the suspension of the Bank Act. The collapse of credit seems to have been sudden and unforeseen. It is not known that the capitalists of Vienna had lately projected many hazardous enterprises; but Austrian stockjobbers had engaged in some of the numerous speculations which have lately been promoted at Berlin and Frankfort. It is said that the rise of sudden fortunes had been regarded with general dissatisfaction, and that the interference of the Government to relieve speculators from the consequences of their own rashness has not been approved by the public opinion of Vienna. Since the close of the war an extraordinary variety of Joint-Stock Companies has been established in Germany, partly in consequence of the influx of money caused by the payment of the French indemnity. Notwithstanding the exclusion of the Austrian territories from the new Empire, Vienna is still a German city, and it has shared in the general excitement. It is said that some local bankers have become the objects of popular indignation; but it may be hoped that the effects of the crisis will be chiefly felt among a limited circle of money dealers and speculators. The tradesmen and hotelkeepers of Vienna may perhaps still enjoy the opportunity of levying a tribute on the crowds of visitors which will shortly throng the city. The panic will serve as an excuse for a further rise of prices, if the tariffs which have been already fixed still admit of an extended margin. A few days will show whether the monetary disturbance extends to the other financial centres of Germany. The enormous sums which have lately been remitted from Paris to Berlin will be partially available for the maintenance of credit; but the ultimate results of the operation are still imperfectly understood.

Even if the panic is confined to Vienna, the inevitable demands of Germany will cause a heavy pressure on the English money market. The great rise in the value of money which is indicated by the late alterations in the Bank rate of discount will both embarrass trade and check speculation. A pressure resulting from external causes, if it is applied in time, may in some instances tend to prevent still more serious disaster; but there is reason to fear that the tide of prosperity is already on the ebb. Until September next, when the last payment of the indemnity will be made, there will be a constant drain of money to Germany; nor is it likely that during the interval the rate of discount in England will be considerably lowered. The unfortunate prolongation of winter into the middle of May has already made it certain that the harvest will be defective; and thus far there is no prospect of a considerable diminution in the price of coal. The share market illustrates the combined results of dear money and of less cheerful prospects of trade. Within six or eight months the average value of railway property has been reduced at least ten per cent., representing a depreciation of many millions. It is true that a fall in the price of railway stock or of any similar investment is not really a loss to the community, inasmuch as purchasers gain at the expense of previous holders; but falling prices represent the existence or the expectation of difficulty. A high rate of discount was maintained for nearly two years before the catastrophe of 1866; but at present it may be explained by the financial operations on the Continent. The probable effects of the transfer of two hundred millions from France to Germany were too highly estimated when the amount of the indemnity was first announced; but the apparent ease with which successive instalments have been provided has caused an excessive reaction of opinion. The entire consequences of the transaction will only be understood after full experience; but it is evident that they will not be unimportant. The accidental coincidence of the receipt of the indemnity with the establishment of a gold currency in the German Empire aggravates the effect of the payment by temporarily withdrawing a considerable amount of bullion from circulation. The demand for gold will perhaps not be perceptibly increased by the panic at Vienna, as Austria still nominally maintains a silver standard, and practically uses a paper currency.

If the monetary disturbance at Vienna and the rapid rise in the rate of discount had occurred a few weeks earlier, the currency reformers in the House of Commons would probably have used the inconvenience which has been suffered as an argument in support of their theories. It would certainly save much trouble if the prices of money, and indeed of all other commodities, were stationary; and in former times innumerable attempts were made by Acts of Parliament and otherwise to counteract the natural instability of value. The regulation of wages by statute and the usury laws proved to be either inoperative or mischievous; but only a few years ago the bakers of Paris were subjected to an arbitrary tariff of prices, and the modern admirers of ROBESPIERRE still applaud the wisdom and patriotism which aggravated the starvation of Paris by establishing a maximum price for flour. The opponents of the Bank Act, and of all legislation of the kind, still think it possible to counteract by law the causes which affect from time to time the value of money; but practical traders have long since learned from their own experience and from the teaching of scientific economists that, when scarcity is approaching, forestallers and regraters of money, while they pursue their own interest, perform a public service by hoarding and by enforcing the exercise of frugality. The Bank of England, though it has sometimes incurred odium by charging a high rate of discount, is only one among several trading firms on a large scale which are bound to secure themselves against probable loss by charging the full value of the article in which they deal. As money for lending is worth a third more than it was worth six weeks ago, bankers would both sacrifice a legitimate profit and increase the risk of a financial crisis by advancing money at four per cent. when they can find solvent borrowers to give six per cent. If the accounts of private and Joint-Stock Banks were published weekly in detail, it would be found that the Bank of England only exercises the ordinary prudence which is indispensable to the safe conduct of the trade in money. The additional cost of trading operations when the rate of interest is high is in no degree caused by the money-dealers, who follow the natural changes in the value of money without attempting to regulate them.

Some of the reports from Vienna imply that the disturbance in the money market has been partly caused by the improper engagements of bankers in speculative enterprises. A stockjobber, or any other trader who deals with capital of his own, is at worst a gambler if he embarks on adventurous undertakings; but the first duty of a banker is to take care that the

funds entrusted to him by his customers shall be at all times forthcoming. The greatest commercial catastrophe which ever occurred in England through the failure of a single firm involved no eventual loss to the creditors, though many shareholders were ruined. A banker who fails is condemned by the simple fact of his insolvency. There is reason to hope that the misfortune which has befallen Vienna will not extend to London. The new German Companies which are probably responsible for the chief part of the mischief are not known to have placed any considerable portion of their capital in England, and the financial and commercial transactions between England and Austria are on a limited scale. The panic will be more formidable if it extends to the two great centres of business at Berlin and Frankfort. It seems to be understood that it will have little influence on French markets. Since the suspension of specie payments in consequence of the war, dealers in all parts of the Continent resort to England to supply any deficiency in capital or in bullion; but the metaphor of drainage which is commonly applied to the abstraction of money is but imperfectly accurate. Water may be drawn off by the mere force of gravitation, but those who require money must be prepared to provide an equivalent; and, if the money market is partially drained, the process has consisted in making advantageous purchases of securities which will afterwards be resold at a profit. The gains of bankers are largest when money is scarce, and England, as the richest country in Europe, is in some sense a bank to most countries on the Continent. It may be hoped that the present high price of money may be fatal to some of the new Joint-Stock Companies which are almost daily started. The increase of the Post Office revenue must be largely due to the recent circulation of prospectuses of enterprises in all parts of the world.

THE RATING AND VALUATION BILLS.

MR. STANSFELD'S Bills have given rise to so many objections in debate that it is easy to foresee how formidable will be the opposition to them in Committee. The criticism bestowed on the scheme is in part general and in part refers to details. Sir MASSEY LOPES is naturally indignant at the result to which his successful motion has been brought. He had a distinct view of the changes which he wished to see made in local finance; he wanted personal property to pay its share of the expenses of the district in which its owner resides, and he wanted the Imperial Treasury to assume a large portion of local burdens. Last year he carried a motion the terms of which were large enough to include the attainment of both the objects he had in view. The answer to his motion on the part of the Government is the group of Bills which Mr. STANSFELD has now introduced. These Bills are framed on a very different theory from that which guided Sir MASSEY LOPES in his efforts last Session. It is not doing justice to the Government to say that they are only trying to gain time, that these Bills show no distinct policy, and that they leave all the great questions of local taxation unsettled. On the contrary, the main purport of these Bills is indisputable, and if the Bills themselves do not reveal it, it was made sufficiently evident by the Ministerial speeches of Thursday night. The Government have distinctly taken up the ground that personal property is not to be taxed for local purposes. They have inserted a clause in one of their Bills making perpetual what is now the annual exemption from rating of stock in trade; and Mr. HIBBERT stated that the experience of America had shown that the system of rating personal property for local purposes worked extremely badly, and he trusted it would never be adopted in this country. Sir GEORGE JENKINSON has given notice that in Committee he will move a clause extending rating to personal property, and thus the issue will be distinctly raised; but if his proposal were carried, the result would be that, while the motion of Sir MASSEY LOPES would receive the effect which its author designed for it, the scope of the Government measure would be entirely changed. As to the second of the two objects at which Sir MASSEY LOPES aimed, the Government concedes the principle that the Imperial Treasury shall help to make up what is wanted for local purposes after real property has had imposed on it all that it ought to bear. But it must first be ascertained what it is that real property ought to bear; and the first thing that engages the attention of those who try to answer this question is that, while most forms of real property contribute to the expenses of local administration, there are many others which do not. The first step, therefore, is to make real property contribute all round, and then the State will know how much is wanted from it. This may be a bad or a good way of dealing with the question; but at any rate it is a perfectly distinct and intelligible way, and there is nothing harsh or unfair about it. The worst that can be said is that it is a plan of dealing with local taxation which must take some time to work out. But then it must be remembered that the only alternative, if the exemption of personal property from rating was to continue, was to make a present to local from Imperial taxation without inquiry; and although this might have been a popular mode of getting over the difficulty, it is not hard to see how very dangerous the precedent would have been.

There are three principal classes of real property which are at present exempted from contributions to local rates. These are metalliferous mines, Government property, and the property of corporations, charitable, scientific, and literary institutions, and Sunday and Ragged Schools. Mr. STANSFELD proposes that all these exemptions shall cease to exist. That mines ought in fairness to bear their proportion of taxation was conceded by speakers on both sides of the House, and it is evident that there is no theory on which this exemption can be defended. Mr. PERCY WYNDHAM stated that in one small district of West Cumberland the annual value of the mines is 344,000*l.*, and yet they contribute nothing to the rates. Mr. PEASE stated that in the district which he represents the Bill would bring into rateable value 100,000*l.* of annual value in iron mines, besides a further considerable amount to be derived from lead mines. The whole annual amount of rateable value throughout the country which would come within the operation of the clause is estimated at little short of twelve millions sterling; and one of the main foundations of the argument of the Government, that the State should not contribute until all who ought to contribute have done so, is this fact of twelve millions of rateable value being exempted by a mere accident of the law. The great difficulty is in constructing the details of the system under which mines would be rated. The Bill contains no definition of a mine; and Mr. PEASE insisted that, unless the Bill declared what a mine means, endless confusion and litigation must ensue. In some districts, for example, a mine is generally held to include not only the ground and machinery, but all branch railways connected with the mine. Mr. PERCY WYNDHAM was of opinion that different systems must be allowed to prevail in different parts of the country. In Devon and Cornwall he allowed that the royalty of a mine might be properly taken as a guide to its rateable value, but he denied that this was at all true of the rest of the country. The general principle of allowing Government buildings to contribute will not be suffered to receive the sanction of law without a strong effort being made to show why the House should not adopt it. Members like Mr. STONE, who represent towns where, as in Portsmouth, a large part of the ground is occupied by Government buildings, naturally insist that it is very hard on other owners of property that they are to bear all the rates while one great owner is to pay nothing. The Government is, it is urged, nothing but one manufacturer amongst many, and its form of profit is the defence of the nation, and it ought to pay rates like any other manufacturer having a profitable use of premises. On the other hand it is urged that the Bill only extends to England, and that, if the Government pays rates, the general taxation of the country must be increased, and thus poor people in Scotland and Ireland will have to find more money in order that rich people in wealthy English towns may find less. It is also argued that the Government itself creates much of the wealth which bears the rates from which Government property is exempt, and that Portsmouth has already got its equivalent in the choice made of it as the field in which a very large part of the money raised by taxation is expended. The proposal to tax municipal property has not as yet provoked any opposition, but a feeble word was spoken on Thursday for charitable, scientific, and literary institutions; while the outcry against the notion of taxing Sunday and Ragged Schools was so strong that Mr. STANSFELD had virtually to yield the point, and to agree that, if the House wished, the proposal should be withdrawn in Committee. The Government, in fact, lets it be understood that as to all its proposals it will listen to recommendations and suggestions in Committee, provided the main principle is kept inviolate, that personal property shall not be rated, and that all real property shall be rated which can practically be made to bear rates.

Although, however, these are the main instances of total or partial exemption, there are other minor ones with which the Government has attempted to deal; and in each case there is very great difficulty in saying what is the right rule to be laid

down, and any decision to which the House may come will, unless the greatest precautions are used, work injustice in the case of some persons. It is, for example, a very vexed question how machinery ought to be rated; and Mr. CAWLEY, speaking on behalf of a borough where machinery is largely used, insisted that no Act ought to be passed which did not define what machinery should be rated. At present machinery fixed on stone is rated, and machinery fixed on timber is not rated. If, again, a large quantity of machinery is worked from a single engine, the engine and boiler are rated; but if each machine is worked by a small separate engine fixed near it, the boiler and steam-pipes only are rated. These are small matters, but one special instance illustrates the difficulty of doing equal justice in the levying of rates better than a large amount of general propositions. Then, again, it is proposed to rate growing timber; but Mr. HENLEY suggested that if the rate only extended, as he supposed, to woodlands, the owners of very valuable trees in hedgerows would escape, and this would be unfair; while Mr. CROSS suggested a problem the answer to which it is not very easy to see. Supposing, he said, a man has a life estate in land, and his life lasts the time while the trees are growing. He dies, and his successor cuts and fells the timber. The tenant for life has paid rates all his life without a farthing of profit. The successor has all the profit without having paid any rates. Mr. CROSS suggested that the Government should devise some means by which the outlay for rates might be repaid by the feller as the trustee to the executors of the unfortunate tenant for life; but the clause would be so very difficult to draw that Mr. STANSFELD is scarcely likely to take the trouble to draw it, or to make himself responsible for it, unless he is obliged; and yet no one can deny that Mr. CROSS has shown a way in which the Bill may work injustice. The Bill also provides that game shall be rated, but here again many questions arise. If the landlord lets the shooting, there is no great difficulty, although what the tenant pays for is not so much property as amusement. But when the landlord keeps the shooting in hand, he may have to pay for what to him is often not a profitable property at all; and theoretically it is not easy to see why a man should pay rates on the pheasants he feeds and kills more than on the chickens he feeds and kills. The distinction really consists in its being thought amusing to kill pheasants, and not amusing to kill chickens; and it is the amusement, not the property, that is taxed. The Valuation Bill also deals with the old dispute so familiar to the readers of economical treatises, as to the basis on which a large house in the country is to be taxed. It enacts that regard shall be had "to the annual value to the occupant in respect of its actual "use and occupation." Mr. CAWLEY remarked that it was impossible to have used words more open to litigation. Great proprietors often have several houses, in one or two of which they live, while they keep a third in repair, out of deference to family tradition. What in such a case is the annual value to the owner of one of the houses at which he does not live, although legally he is the occupier? Or, again, a man may have inherited a house three times too big for him, and although its annual value would be great to a richer man, its possession may be a positive loss to him. It may be repeated that these are but tiny objections, and that few people will be much injured if in such respects the Bill is defective. But men naturally look at a Rating Bill from their own point of view, and see how the new shoe will pinch their own particular foot; and one of the great obstacles which Mr. STANSFELD has to face is that almost every clause of his Bill hurts somebody, that he will have to meet one little outcry after another, and that in most instances each little outcry will have some very fair foundation for its existence.

GERMANY.

THE Session of the Prussian Parliament has closed, and its work has been done. It has passed the famous Ecclesiastical Bills which must mark so decisive an epoch in German history. Prince BISMARCK took occasion before the close of the Session to review his work, and to express his final sentiments on its character and on the necessity which had dictated it. He made no disguise of the fact that the law of the German Parliament for the expulsion of the orders affiliated to the Jesuits had been carried out with considerable rigour; and, although he explained that many brothers and sisters of the orders had been left in peace, he made it clear that every one from whom the slightest cause of offence could be apprehended had been turned out of the country. To get rid of the worst of his enemies, and to keep those in the second rank of obnoxiousness under very strict control, is his plan, and it is a plan which he is carrying out in the face of day, and with the hearty concurrence of Liberal Germany. He seems to have thought it necessary to reply to some of his critics who had objected that his policy was entirely out of keeping with the policy which England and Russia pursue towards Ultramontanism. As to Russia his answer was simplicity itself. Others might fancy they understood the policy of Russia, but he had the advantage of really understanding it, and he could speak from personal knowledge when he said that those who supposed Russia to have any kindly feeling for Ultramontanism were entirely mistaken. Nor could he believe that England could view with much sympathy a set of people who had succeeded in making constitutional government in Ireland impossible. Perhaps we in England should scarcely allow that what Prince BISMARCK said was not in some degree exaggerated, but if he had chosen to say that we are very tired of conciliating Irish ecclesiastics, and that the greater degree of lenity with which Englishmen regard Ultramontanism is largely due to the fact that they have not to apprehend from it the political dangers with which Ultramontanism threatens Germans, we should not have had anything to do but to agree with him. That the real battle in Prussia is still to be fought when the measures now passed into law come to be practically applied is obvious to every German, and Prince BISMARCK is the last man in the world to try to conceal it. The bishops have met, and have vowed that they will resist to the utmost the laws of their persecutors, and will suffer everything rather than concede anything. We must own that it is very hard to understand how the new laws, and especially that requiring every minister of religion to receive a lay education, can be carried out without an amount of oppressive interference that will make the action of the State wear the appearance of something very like tyranny. All that can be said is that Prince BISMARCK uniformly asserts that he has counted the cost of what he is doing, and that if, in dealing with resolute and unscrupulous enemies, boldness is prudence, he certainly has been sufficiently bold.

Ultramontanism, however, is by no means the sole cause of trouble to the German CHANCELLOR. The thorn of his conquered provinces is always running into his side, and his astonishing frankness was never perhaps more clearly displayed than in his recent speech on the present state of Alsace and Lorraine. His audience endured to hear from him what they certainly would have received with explosive indignation from any one else, that one cause of the difficulty of governing those provinces is the inability of Northern Germans to make themselves pleasant. Nothing can be more true, and nothing could be more salutary than that the governors should take this disagreeable fact into consideration when they wonder why the governed dislike them. Prince BISMARCK might have added that not only do the Alsatians dislike the Germans, but they like the French. They have exchanged masters kindly, easy, and sympathetic, for masters harsh, difficult, and rigid. They feel like boys who have seen a placid, indolent, tender-hearted schoolmaster sent away, and a priggish certificated teacher placed over them in his stead. There is no sign whatever that Germany has as yet made any way in the affections of the provincials. They have been bribed by handsome allowances out of the French indemnity; but they have taken the bribes without thanking the bribers. It has been found necessary to propose a Bill to the German Parliament extending the term during which the provisional state of things is to continue in the newly acquired provinces. The difficulties of local administration seem also to grow greater rather than less. One member of a town council is so extremely annoying that he has to be dismissed, and immediately all the other members resign because they will not seem to desert their friend and colleague. This is very provoking, for what can Prince BISMARCK do, except concentrate the administration of the town in the hands of some stern North German, who is sure to take every possible means of keeping the wound of disaffection open? Prince BISMARCK can but trust to time and patience. The world, he says, is sceptical as to the skill and adroitness of Germans in the art of government, but it cannot possibly call in question that the Germans will persevere. Through good and through evil they will carry on a task which they have once begun. Prince BISMARCK, however, invited his hearers to believe that there was one ray of hope to gild the gloomy prospect. Before long Alsatian deputies will take their seats in the German Parliament, and this will do them, and those whom they represent, a vast amount of good; it will show them

what Germany really is, and what are the virtues and resources of the Empire to which they have been annexed. Whether he is right or wrong, it is evident that Prince BISMARCK spoke in accordance with a general idea which colours his whole conception of the relations of these provinces to Germany. His view is that Alsatians are to be made Germans not in Alsace, but in Germany. Some months ago he dilated on the beneficial influences which would be derived from Alsatians joining the German army, being quartered in German towns, and mixing in the social and domestic life of German circles. The private soldier and the deputy are thus to learn the same lessons, and instil into the minds of those they have left behind the same thoughts as to the advantages which Germany can confer and the evils it can inflict.

Success always succeeds, and many little triumphs have been won by Prince BISMARCK in addition to his two great triumphs of making the Upper House succumb on the Counties Bill and in passing his ecclesiastical measures. In the first place, he has managed to remodel the Prussian Ministry until he has at last secured a majority of avowed Liberals and trustworthy followers. In the next place, he has entirely altered the tone of the Conservative party; they have just issued a manifesto in which they heartily accept the new position he has created for them. They seem as if they were sincerely obliged to him for all that he has done. The manner in which he broke the neck of the resistance of the Peers seems to have faded out of their thoughts, and they have nothing more to say as to his ecclesiastical Bills than that it now behoves the Evangelical Church to see that it makes capital out of the new order of things, and uses the advantage which a hearty alliance with the State may give it in the face of Catholic disaffection. The only point on which they insist as the special sign of their Conservatism is that they are, and intend to be, enthusiastically loyal. But as the KING goes heartily with his Minister, loyalty comes to be the flag under which Conservatives will fight the battle of Liberals. The German Parliament is even more ready than the Prussian to advance in the path in which Prince BISMARCK seeks to push it. If any questions could have been supposed likely to cause dissensions in the Parliament, they would have been the questions springing out of the proposal for the recasting of the coinage and paper circulation of the Empire. But although differences of opinion have shown themselves, there has been no bitterness, and no inclination to oppose, from jealousy of Prussia, schemes in many respects alien to the habits and distasteful to the feelings of the smaller States. The Parliament, too, is always contriving something of its own free motion which shall impel some backward part of Germany in the new paths of unity and Liberalism. It has just passed a resolution that it is not fit that any portion of Germany should be destitute of local representative institutions. Mecklenburg was the tiny offender which this resolution was intended to affect. It has long been completely in the hands of perhaps the most petty and backward aristocracy in Europe, and this aristocracy views with sublime horror the notion of common people pretending to take a part in government. Before the censure of the Empire, however, even the nobility of Mecklenburg will probably give way, and it deserves notice that the GRAND DUKE by no means shares the sentiments of his nobles, and is as anxious as his humblest subject that Mecklenburg should have a Lilliputian Parliament of its own. It is not only on account of Mecklenburg that this deserves notice; for it may be observed that the small princes of Germany have, on the whole, shown themselves much more inclined to reform than could have been expected. They used to be laughed at or scorned as men with the ideas of another century, absorbed in the contemplation of their trivial grandeur, and without even the mental faculties on which new thoughts could work. But the world was unjust to them, and whether their motives may have been those of fear or awakening intelligence, they have, with few exceptions, shown a desire to meet the general wishes of the country which does them considerable credit.

THE IRISH PEACE PRESERVATION ACT.

THE Bill for renewing the Irish Peace Preservation Act passed through its different stages with less than the usual accompaniment of cant. It is still conventionally necessary that a Minister should affect to regret the necessity of legislating in accordance with the circumstances of the community; but Lord HARTINGTON, in his speech on the second reading, passed as soon as possible from the accustomed commonplaces to the reasons which render the renewal of the Act expedient. It was scarcely necessary to adduce any further proof of the necessity of renewing the Act than the statement that the LORD-LIEUTENANT had found it necessary to proclaim nearly every county in Ireland. In other words, the country can only be governed by the employment of powers which are not conferred by the ordinary law. Another statute, called the Life and Property Protection Act, is only applied to the whole or part of two or three counties; but the operation of the Westmeath Act, as it is commonly called, has been conspicuously beneficial. Agrarian crime has been reduced to a mere fraction of the amount which prevailed before the passing of the Act; and Lord HARTINGTON stated that the imprisonment of only nine persons under the provisions of the law had practically crippled Ribandism in Westmeath. It is possible that some fanatics of liberty may think it desirable that a handful of murderous conspirators well known to the police should enjoy perfect immunity because their guilt cannot be substantiated by legal proof. Whether any of the Irish members are troubled with these excessive scruples may be reasonably doubted. Twenty-eight members voted against the second reading of the Peace Preservation Bill with full knowledge that their opposition would be as ineffective as it was perhaps sincere. There is no reason to suppose that they really differed from the great majority of their colleagues who took the opportunity to be absent. The opponents of the Bill complained bitterly that the Treasury Bench was empty while new chains were forging for unhappy Ireland; but if Ministers and English and Scotch members abstained from swelling a majority already sufficient, there was nothing to prevent indignant Irish patriots from protesting against a tyrannical measure. Mr. MITCHELL HENRY explained the absence of his colleagues on the singular theory that they have not the spirit to contend with their oppressors in an alien Parliament; but it might have been thought that a defeat would have furnished a better argument for Home Rule than a display of entire indifference to Lord HARTINGTON'S project of coercion. Another explanation of their absence may perhaps be found in their estimate of the opinion of their constituents. Even in Westmeath, peaceable men are more numerous than assassins, and, under a system of secret voting, the mass of the population may perhaps not be disinclined to secure to itself protection against the Ribandmen and their leaders. The O'DONOGHUE had the courage to express the conviction which he probably shared with many members of the minority. Every Irish member who failed to take part in the division may fairly be considered a supporter of the Bill. The few adversaries of the measure are ostensibly committed to the proposition that murderers ought not to be locked up, and that journalists are entitled to publish treason with impunity. The rebel press, even under the restrictions of the Peace Preservation Act, indulges in a freedom which elsewhere would be regarded as unbounded license. In general it may be said that no loyal or respectable subject is in any degree incommoded by the provisions of the Act, and that its penalties can only be incurred by the most reckless violators of the law.

When the Bill went into Committee, Mr. PIM proposed that it should be referred to a Select Committee consisting of all the Irish members, with the addition of Mr. BRUCE and Lord HARTINGTON. If the motion had been carried, the proposed Committee would immediately have divided itself into two hostile parties; and perhaps its discussions would have thrown light on the probable results of Home Rule. The reasons against Mr. PIM'S proposal were obvious and conclusive. It is the business of Committees either to collect information for the use of the House or to elaborate in detail some measure which has been adopted in principle. It is by an entirely different machinery that the Scotch members retain for themselves the chief control over measures which concern their constituencies. Dr. BALL protested with appropriate vigour against the innovation of establishing a little Irish Parliament at Westminster. The Committee could not have obtained any information which was not already accessible; and it is highly important that in all cases of suspension of the law the Government should be prepared to act on its own responsibility. It was a great mistake to refer the state of Westmeath to a Committee when the Life Preservation Bill was first introduced; and the objections to Mr. PIM'S little Legislature are far more conclusive than the reasons which were formerly urged against reference to a more dispassionate tribunal. It was evident through the whole course of the languid opposition to the Bill that the protesting Irish members were not in earnest. One opponent

of the measure gravely complained of the provision which renders a licence necessary for bearing arms, on the ground that it interfered with the lawful and harmless pursuit of sporting. One of the most conspicuous instances of the injustice or inequality of English legislation for Ireland consists in the exemption of the Irish from assessed taxes, and from some other burdens of the same kind. If it is lawful in Ireland to shoot game without a licence, no such privilege is enjoyed by Englishmen; and Mr. LOWE has long since imposed a tax of ten shillings a year on persons who for any purpose carried a gun. As Mr. RONAYNE justly observed, Westmeath tenants are not likely to take out licences for firearms to be employed in shooting their landlords; and it seems but a trifling hardship to be compelled to ask for a gratuitous certificate which would be granted as a matter of course to any respectable person. The object of requiring the licence is to give the police a hold on the unlicensed patriots who may happen from time to time to be about to shoot their landlords or other objects of their dislike. Roving assassins who have not been able to provide themselves with the necessary document are likely to be apprehended if they are nevertheless found in possession of firearms. The Fenians who occasionally break into gun-shops at Cork or in other towns will be hampered in the use which they might feel inclined to make of their booty. It is difficult to imagine any case in which an honest and peaceable Irishman could suffer any inconvenience from the regulated permission to carry arms.

The ease with which necessary Coercion Bills have lately been passed does credit to the good sense of Parliament and of the Irish members themselves. When the Peace Preservation Act was first passed, and when the Westmeath Bill was introduced in the following year, it was thought necessary to mention the intended legislation in the Speech from the Throne, and in one instance to refer the evidence which justified the action of the Government to a Select Committee. At an earlier period great political issues turned upon Bills for preserving the peace of Ireland, and more than one Ministry was overthrown in the course of conflicts on the question. Lord GREY retired from office in 1834 in consequence of a long series of blunders and intrigues in which some of his subordinates had contrived to engage with O'CONNELL. In 1846 Lord JOHN RUSSELL, after standing aside to allow Sir ROBERT PEEL to pass the Bill for abolishing the Corn-laws, successfully coalesced with Lord GEORGE BENTINCK to drive the Minister from office by defeating a necessary Coercion Bill. The Tory leader boldly avowed his approval of the measure which he opposed, but he contended that a Government which had broken up its party could not be safely trusted with exceptional powers. Lord JOHN RUSSELL, as soon as he had attained the object of driving his rival from office, immediately passed the measure which he had denounced as oppressive and unnecessary. All statesmen were then, as now, convinced of the necessity of preserving the peace of Ireland; but when parties were evenly balanced, it was sometimes thought expedient to court by liberal professions the favour of O'CONNELL and his adherents. In these days politicians have perhaps become more conscientious; and the robust faith of former times in the universal applicability of the British Constitution has been occasionally disturbed. Nevertheless interference with the common law rights of the Irish subject is carefully restricted within the narrowest limits. As a Liberal Irish member observed during the desultory debate on the Peace Preservation Act, no ordinary person would know that such a law was in force unless he derived his information from the seditious newspapers of London. The Irish Government seems to have exercised its powers with extreme moderation and with sound discretion. One Irish member called attention to the excess of arrests under the Act over the discharges and the present detentions. It appeared that some of the Westmeath Ribandmen are not in prison, and that they are not pursuing their usual avocations in the neighbourhood; and it was regretted that some of the leaders had been allowed to leave Ireland for America as a condition of their release. As it is contrary to the principles of Englishmen to punish offenders without trial, the Government has probably acted with sound judgment in getting rid of some of the ringleaders in the most convenient manner. They had been taken into custody because it was known that they promoted murder and other crimes of violence, although there was no legal evidence of their guilt. As the object was to get rid of criminals whom it was impossible adequately to punish, their expatriation was desirable for all parties. In the United States they will either abandon their former habits, or they will be convicted and punished without the smallest scruple. In the meantime life in Westmeath has become tolerably safe. Before trial by jury is re-established as the sole method of protecting society in Westmeath, it may perhaps have been found expedient to adopt the suggestions of the Select Committee on the Irish jury system. The modest remark that persons unable to read or write the English language ought to be exempted from serving on juries seems to deserve attention.

THE SPANISH ELECTIONS.

IF the Republican party in Spain or the Government ever attached importance to the general election, they must have been seriously disappointed by the result. The Federal Republicans have succeeded in returning an almost unanimous Assembly, except indeed that the uncompromising faction of their own body will constitute a troublesome minority. Within a few months two previous elections have provided as many Governments with overwhelming majorities. SAGASTA and the Conservatives, ZORRILLA and the Progressists or Radicals, were in turn omnipotent, as far as power depended on the ostensible opinion of the constituencies. ZORRILLA showed his appreciation of the value of representative institutions in Spain by endeavouring to induce some of his political opponents to accept seats in the Upper House of the Cortes. SAGASTA had before him been accused, probably with justice, of packing the elections; but in Spain the Minister for the time being hardly needs to trouble himself with the details of interference. The supporters of each successive Government are the only politicians who have any sufficient motive for exerting themselves in the formation of the preliminary Committees which superintend the elections. The control of the ballot-boxes conveys an irresponsible power over the returns; and the electors, even if they felt any interest in the elections, knew that it would be useless to vote for Opposition candidates. On the present occasion, the great mass of the population, anticipating the inevitable result, deliberately abstained from voting; and it is doubtful whether even the dominant party exhibited its full numerical strength. According to the electoral law, if indeed there can be said to be any constitutional law in Spain, the suffrage was restricted to voters who had attained the age of twenty-five; but the Republican Government, for the purpose of ensuring ripeness of political judgment, arbitrarily extended the privilege to all persons over the age of twenty. It has, after all, only been found possible to induce a fourth or fifth part of the qualified electors to vote; and, in substance, the return of the Constituent Cortes is equivalent to a census of the Republican minority, including the stray politicians who habitually support any Government which may be in power. It is evident that no value will attach either to the ordinary or to the constituent legislation of a body which is virtually nominated by the Ministers that they may continue to exercise power in its name. After the discreditable Parisian catastrophe of 1848, the Constituent Assembly contained a large majority of members opposed to the policy of the revolutionary Government. The sham Spanish election still more emphatically condemns the Republican usurpation. As soon as the nation finds means of expressing its will, any movement for the overthrow of the Government and the Cortes will be morally excusable, if only it is justified by success.

The process of making a Constitution will be a farce, except so far as it involves the abstruse problem of Federalism. For sixty years past ingenious legislators have provided the Spanish nation with a long succession of impracticable and inoperative Constitutions. In every instance the object has been to apply principles of extreme democracy to the details of government and administration, and the latest experiment, completed three or four years ago, was applauded by the leader of the Hyde Park rioters as a model system which might be advantageously copied by the benighted Legislature of England. The limitation of age which formed the only check on universal suffrage has already been abolished by the Republican Government; and, with the best possible intentions, it is impossible to provide larger securities for that kind of liberty and equality which finds favour with modern revolutionary theorists. It will be perfectly easy to renew the prohibitions against suspension of the ordinary rights of law; and the Republican generals in the Northern provinces will disregard any enactment of the kind as willingly as if they were under the orders of PRIM or SERRANO. The difficulties of the Constituent Cortes will commence with the task of organising a Federal Government. In the first place, no poli-

tician in or out of Spain knows what Federalism means; nor has CASTELAR ever succeeded, notwithstanding his rare powers of language, in expounding in intelligible terms the faith which he professes. The anarchical classes, who alone wish in earnest for a Federal Republic, desire, as far as they have any definite plan, that the country should be governed by themselves, through the agency of local Clubs exercising despotic and irresponsible power in every town and district. They have persuaded themselves that there is no necessity for maintaining a national army, or for contributing to the expenses of a central Government. The revenues of the dominant Juntas or deputations will probably consist of forced loans, or of other exactions from the wealthier classes; and some of the more advanced Clubs are prepared in their respective districts to abolish property altogether. Cultivated Republicans such as FIGUERAS and CASTELAR have no disposition to concur in a dissolution of political society; but they will grievously disappoint their adherents if they content themselves with proposing a mere enlargement of the functions of provincial authorities. It will scarcely be proposed that the different kingdoms which were finally united under the sceptre of FERDINAND and ISABELLA should once more be severed for administrative purposes; and, on the other hand, there is no historical pretext for the establishment of the smaller provinces as independent States of a Federation. Statesmen cannot dispense, like local demagogues, with an army, and the military force must necessarily be subject to central control. The recent policy of arming Republican Volunteers for the purpose of keeping the regular army in check would, if it were habitually pursued, render civil war inevitable. If the Spaniards really desire Federal institutions, they ought to have maintained the Monarchy as the connecting link of the various communities within the Union.

If the centrifugal force which undoubtedly exists in Spain ultimately prevails, the Constituent Cortes will have little share in the task of disruption. The pretensions of an Assembly elected by a fraction of the community will not be seriously accepted either by friends or by enemies. The last Parliament was summarily turned out of doors by FIGUERAS and his colleagues, amid general indifference; and the body which succeeds it will have even less title to respect. It is a curious and instructive fact that universal suffrage never believes in itself. The multitude, once convinced of its own indefeasible supremacy, logically infers that it is impossible to transfer to representatives an inalienable right. The new Cortes will, at the risk of dissolution, obey the orders of the Government, until some rival faction succeeds in grasping executive power. If the proposed Federal Constitution proves to be unpopular, the Cortes will be unceremoniously ejected to make room either for a more docile Assembly or for a dictatorship. If any portion of the army retains its discipline and organization, no long time will elapse before a military leader undertakes, probably with the general good will of the respectable classes, the meritorious and profitable duty of restoring order and security. The horror or disapprobation which such enterprises have sometimes provoked would have no justification in a country which has for the present no constituted authority to respect. The Government exists by the favour of the rabble of Madrid, and of that part of the military force which proved too strong for the conservative section of the militia in the late disturbance. The Cortes will be still more powerless than a Ministry which includes the recognized leaders of the party in power. For a freely elected Assembly Spaniards entertain little habitual deference, and it is notorious that the Constituent Cortes in no sense represents the nation. The few Conservatives and Progressists who were elected will not even take their seats. Opposition to the establishment of a Federal Republic might be dangerous, and it would certainly be useless.

When, after the abdication of the KING, the Republic was first proclaimed, shallow observers congratulated the Spanish nation on the easy and peaceful transition from one form of government to another. More serious politicians were not surprised at the temporary calm which is almost always produced on the morrow of a revolution by complacency on one side and by alarm on the other. The Republicans had for the moment obtained more than they had asked; and the defeated Conservatives were gratified and surprised to find that they had not yet been molested. A section of the outgoing Progressists was admitted to a share in the administration; and CASTELAR, with florid eloquence, assured the representatives of Spain in foreign countries that the Republic was not less capable than the Monarchy of maintaining security and peace. During three months which have since elapsed there has been a Ministerial crisis, and a second revolution, resulting in both cases from the lawless interference of the mob of the capital. ZORRILLA and SAGASTA on the first establishment of the Monarchy prudently retired into concealment or into exile. OLOZAGA, who at the urgent entreaty of CASTELAR returned for a time to his place as Minister to France, has resigned, or is about to resign, his office, and has not thought it safe to return to Spain. SERRANO, who three years ago occupied an almost regal position in Spain has found, in the necessity of escaping in disguise, the fit reward of his capricious intrigues against the foreign Prince whom he had himself invited to occupy the throne. The numerous fugitives may perhaps have shown excessive timidity; but, by the common consent of all parties except the faction in power, society is exposed to the gravest danger. The Ministers are not anxious to injure their political opponents, but they could not have protected SERRANO against the violence of the rabble if he had not taken elaborate precautions for his own safety. The tranquillity which has prevailed during the election proves nothing except the natural indifference of the constituency to a function which is nothing but a form. Moderate and thoughtful Spaniards probably, with few exceptions, now regret the generous impatience of statesmen and generals who could no longer tolerate the scandals of Queen ISABELLA'S Government and Court. It would, as the result has shown, have been better to bear with existing evils than to set the stone of revolution rolling. If PRIM had lived, or if SERRANO and his associates had loyally supported King AMADEO, there would have been another chance of retrieving past errors. The prospects of improvement through the Republic are faint and distant.

MR. MIALL ON DISESTABLISHMENT.

MR. MIALL'S speeches carry those who hear or read them into a world which seems to have no connexion with that in which they are delivered. The mysterious beings with which this world of Mr. MIALL'S is peopled are suffering from an overpowering sense of religious inequality. The existence of an Established Church is as an iron driven into their very souls. The Dissenter as he is known to Mr. MIALL is a being of a different order from the Dissenters who are to be met with every day. In business or in society the mask is on their face, the inward torture is hidden beneath the mechanical smile. There is a place, of which only Mr. MIALL seems to have the secret, in which this simulated cheerfulness is laid aside. It may be in the vaults under Mr. SPURGEON'S Tabernacle, or behind the hoarding which conceals from the careless or cruel gaze of members of the Established Church the rising glories of the City Temple. But, wherever it is, it evidently serves as a refuge for Nonconformists weary of acting a part. Here they can come from the House of Commons or the dinner party and clank their chains at pleasure. Here they can vow that, in spite of appearances, life with an Established Church is no better than a living death. Here they can join their mournful songs to an accompaniment of abstract resolutions. This is the Dissenter as Mr. MIALL has the privilege of seeing him; and if the retiring Nonconformist nature would consent to show itself to the world in its true colours, the Established Church would have but a few days to live. Majorities are not above being moved by the obvious wretchedness of minorities. If the iron could not be got out of Dissenters' souls without overturning the existing religious settlement, the general feeling would still be that it must be got out at any cost. But the Dissenters kindly spare their countrymen's feelings by leaving the iron at home whenever they come out into society. They are in the habit of boasting, and boasting with very great reason, that they have got rid of all the disabilities to which they had for centuries been subjected by laws made in the interest of the Established Church. There is not a hardship left for them to complain of, except it be that they are forbidden to pray or preach in churchyards which belong to other people. We are so accustomed to these accents of triumph that Mr. MIALL'S yearly dirge comes upon us as a yearly surprise. It is true, no doubt, that the establishment by law of the Churches of England and Scotland involves a violation of religious equality. But there is scarcely any institution established by law that does not involve a violation of principles equally dear to some minority or other. Why should the Dissenter who objects to a State Church be more considered than the Dissenter who objects to a State army? There may be good reasons for drawing a distinction between the two cases, but they must be reasons

founded on considerations of practical utility. If the majority are justified in taking the Quaker's money to pay the soldier who fights for them, they are equally justified, as a matter of theory, in taking the Baptist's money to pay the parson who christens their children. If Mr. MIALL wishes to prove his point, he must condescend to particulars. He must show the precise harm that the violation of religious equality involved in the existence of an Established Church does to his clients. Where the Irish Church was concerned there was no difficulty in meeting this challenge. The mischiefs wrought by the violation of religious equality in Ireland were everywhere apparent. When Mr. MIALL can produce anything approaching to a similar list as regards the Church of England, he may feel confident of a similar victory.

The violation of religious equality is only one of the charges which Mr. MIALL brings against the system of religious establishments. It is a further vice of this system, he says, that it deprives the Church of the right of self-government, and a large part of his speech was devoted to an enumeration of the evils sustained by the Church of England by reason of her bondage to the State. This argument admits of a very simple answer. Whether the interests of religion would or would not be promoted by the abolition of the Established Church, it is exceedingly unlikely that the Church of England, as we know it, would long survive the separation. Other Churches would arise out of its ruins, more enthusiastic, more dogmatic, more united. But the Church of England as it is would have gone hence, killed by that strife of parties which only the machinery of the State has the power to keep in abeyance. In 1869 there were some who predicted that the same result would follow from disestablishment in Ireland, but it was answered—and, we own, as we then thought, successfully answered—that the differences which divided the parties in the Irish Church were of too unimportant a character to have this effect. The event has proved the contrary. The Irish Church, which before disestablishment seemed to have only one party within its pale, has developed others with extraordinary rapidity, and has already pushed revision to a point which threatens to end in open schism. If this is what has happened in Ireland, what might be expected after a corresponding revolution in England? The last thing that can be said of English Churchmen is that they are all of one party. On the contrary, they are, and avow themselves to be, of all shades of belief. Under the tolerant eclecticism of the State they somehow contrive to go on side by side; but if they were free to manage their affairs for themselves, this enforced harmony would not endure for a single year. The first Session of Convocation after disestablishment would bring out all the latent discords, and demonstrate the impossibility of two walking together who are not agreed. It is open to Mr. MIALL to contend that frank separation is better than unreal agreement; that High Churchmen who, as he would say, differ from Roman Catholics only on points of form, and Low Churchmen who agree with Dissenters upon all matters of substance, can have no genuine community of sentiment or action; and that he who opens their eyes to this fact will be a true friend to both. We are not concerned to inquire whether Mr. MIALL would be right or wrong in asserting this. It is enough for our purpose to point out that what he does assert is something quite different. He promises the Church of England that she shall come out of the cauldron of disestablishment endued with new vigour. Those who feel sure that the institution which went into the cauldron would never come out at all may be pardoned for asking for some further evidence as to the ultimate results of the process.

Mr. MIALL's third and last proposition—for his fifth and sixth are simply deductions from those that have gone before—is that the existence of an Established Church imposes on Parliament duties which it is not qualified to discharge. To this it may be replied that, as Parliament consistently omits to discharge them, this objection is deprived of its principal force. If the House of Commons were continually meddling with ecclesiastical matters, the position of affairs would soon become intolerable. But as for the most part it has the good sense to leave them alone, the worst that happens is that the Church is not as free to modify her organization and machinery as some of her more enthusiastic members wish her to be. To those who value the Church of England as she is, and have no wish to see her subjected to radical changes in any direction, this is not a matter to be deeply regretted. These persons are ready to put up with an admitted absence of consistency and decision rather than lose the tolerance and largeness of mind which is to some extent secured by subjection to the State. This subjection cannot have its perfect work except on condition that no important ecclesiastical changes can be introduced unless by Parliament, and that it is well understood that Parliament has no mind to introduce them. As things now stand, all parties in the Church of England have a large amount of practical freedom to go their own way, so long as they can anyhow bring themselves within the very elastic limits of conformity defined by the law. They may fairly think themselves fortunate that they are under the control of a Parliament which is content to let well alone, rather than under that of an ecclesiastical Synod inspired with a zeal for improvement which must end in two parties out of three being improved out of the Church. Upon all the three points, therefore, upon which Mr. MIALL chose to rest his case it has broken down. He has not shown that the violation of religious equality is anything more than technical and nominal. He has not shown that the Church of England would be either stronger or freer if her subjugation to the State were at an end. He has not shown that any harm follows from Parliament being nominally charged with duties which in point of fact are performed by nobody. It is satisfactory that a position so weak in theory should have proved equally weak when brought to the test of a division. Mr. GLADSTONE's speech aptly expressed the weariness of the subject which has overtaken the existing House of Commons; and there is nothing to show that the feeling out of doors is in any way more favourable to Mr. MIALL's cause. Until the verdict of the constituencies has been given against him, it is hardly to be expected that he should retire from the contest; but to all appearance the next general election will give him this additional excuse for leaving disestablishment to slumber awhile undisturbed. In the meanwhile, the zeal of that knot of self-conceited agitators which has been for some time deafening our ears with the assertion that the nostrum of the Liberation Society is ripe to be accepted as the prescription of the Liberal party will have received a salutary cataract of undeniably cold water.

THE SHIP OF THE FUTURE.

THE discussion in Committee on the Navy Estimates on Monday showed that the Admiralty are still very much in the dark as to the type of the war-ship of the future. They have undertaken to build a couple of large ships this year, but they have not yet been able to make up their minds what sort of ships these shall be. Of one of them Mr. GOSCHEN has given no account whatever, and though the other has been described as a new *Fury*, it turns out that she is to be different from the *Fury*, and also different from the *Devastation*. Indeed, for the matter of that, it is not quite certain what sort of a ship the Admiralty may make of the *Devastation* before they have done with her. She has always been spoken of as a mastless vessel, but she has been fitted up with a mast, and, according to Admiral ERSKINE, one of the biggest masts in the navy, and the Admiralty are considering whether she shall not have sails too. The *Devastation* has steamed over from Portsmouth to Queenstown, and is now waiting till there are some waves off Bantry which will test her sea-going qualities. As yet she has done very well, but then she has had only light winds and short waves to contend with. A ship that even in smooth water pounds the swell into spray and flings it on to the fore-deck in "clods" of thirty and forty tons, may be expected to have some lively experiences among the Atlantic rollers. There are two dangers to which the *Devastation* is exposed: first, the water may get into her; and, secondly, the water, even without getting inside, may lodge in such vast quantities on the deck as to weigh down the vessel. The first of these dangers is supposed to have been sufficiently guarded against in the construction of the ship. All the openings for air are carried far above the possibility of water bursting into them; and we have Sir SPENCER ROBINSON's assurance that, as long as these openings are closed, even if the ship were to be forcibly immersed, she would be lighter than the volume of water she displaced, and, therefore, when released, must come to the surface. These are points, however, on which argument is rather thrown away on the eve of practical experiments. The best proof of the stability and buoyancy of the ship will be that she floats at sea. There is at least no room for any doubt as to what the *Devastation* is intended to be. The Admiralty are prepared to stand by her as a sea-going ship capable of sailing to the Channel, the Mediterranean, or across the Atlantic, and Mr. GOSCHEN has stated distinctly that, if

she fails in this respect, she will be a failure altogether. She draws too much water for coast defence, and for that purpose a more suitable vessel might be built at much less cost.

It is important to know whether, in the *Devastation*, we have a good serviceable ship; but it is even more important to know what is the right type of ship to go on building; and we could afford to sacrifice the *Devastation* if it would only be the means of solving this problem. It is obvious that, in the nature of things, a ship of war must necessarily be a compromise. She must be a fighting ship and a sailing ship, and her qualities in each case will always be in a great measure antagonistic. For fighting purposes the ship must carry heavy artillery, and must be protected by strong armour; and weight, even for its own sake, is desirable as a means of increasing the power of impact. On the other hand, you can hardly have a good seagoing ship without masts, and masts get in the way of the guns. A thickly-plated ship, which carries four 35-ton guns in revolving turrets, sweeping the horizon on every side, and which can be propelled as a ram at the rate of over sixteen statute miles an hour, and then turned in a couple of minutes against another object in just the opposite direction, certainly leaves little to be desired as a fighting ship; and thus much may be said for the *Devastation*. But all these advantages have to be paid for out of her sailing qualities; and the question is whether too much has not been sacrificed in this respect. Even if her stability is proved, will she be sufficiently manageable in a heavy sea? And how long can she remain at sea? In other words, what stock of coals will she carry? It may be assumed that, even if it should be decided to try the effect of sails on the *Devastation's* single mast, the sails will be regarded only as a very subordinate assistance to the engines, and that, if the engines broke down, the ship would be practically helpless. As the ship is propelled by two separate screws driven by double cylinders and separate engines, and as either screw is capable of alone propelling the ship, the chances of a total break-down of the machinery may be regarded as somewhat remote. But even if the machinery were all right, it would be useless without coals. It was estimated in the first instance that the *Devastation* could carry from 1,600 to 1,700 tons of coal, which would enable her, with a moderate consumption of fuel, to remain at sea for some thirty-six days; but the weights of the ship have since been increased to such a degree as to encroach considerably on the margin for fuel. It does not appear that the Admiralty have yet come to a definite conclusion on this point, but the excellence of the engines has in some measure got them out of the difficulty. The engines have developed upwards of a thousand horse-power more than was contracted for, and given the ship an extra speed of a knot and a quarter; and it is now calculated that 1,400 tons of coal would send her about as far as 1,600 tons on the original plan. But it has yet to be seen whether she can carry even this quantity of coal, and also what will be the effect of the reduced weight below on the general stability and buoyancy of the vessel.

Mr. GOSCHEN has appealed to the House of Commons to have confidence in the Admiralty, and to allow them a wide discretion in applying the shipbuilding votes. They are anxious to see how the *Devastation* turns out, and they are also keeping a watchful eye on what other Powers are doing, and they would like not to be tied down too tightly to particular plans, and to be able to take advantage of any new ideas or fresh experience that may turn up. In itself this seems to be reasonable enough. England of course cannot afford to sit still with folded hands waiting for a revelation of a perfect type of ship, while other countries are busily building ships which may not be ideally perfect, but which are at least extremely formidable. Still it may be just as well to be cautious in laying down new ships, and a delay of a few months can hardly make very much difference. The most certain way to waste both time and money would be to begin a ship in a hurry without having a clear idea of what it is to be. In the meantime it might be worth while to consider whether the arrangements of the Construction Department are really calculated to promote the object in view. The late Controller, in a pamphlet on the *Devastation* which he has just published, incidentally gives an instructive history of the progress of the designs for that ship. The late Constructor, Lord DUFFERIN's Committee, and the present Council of Construction have all been employed upon it in succession. The result appears to be that the ship in its present form differs from the original design, and that the principles of that design have been thrown into somewhat dangerous confusion. According to Admiral ROBINSON's calculations, the weights of the *Devastation*, allowing for 1,600 tons of coal, are 585 tons in excess of the estimate of 1871, and 552 tons beyond the first estimate of 1869; while her mean draft of water is nearly sixteen inches beyond the calculation of 1871, and thirteen inches beyond that of 1869. "No one," observes the Admiral, "would be justified "in sending such a ship to encounter Atlantic weather with "an immersion exceeding by thirteen inches her intended "flotation, and the only proceeding possible, if she is ever to "do that for which she was specially designed—namely, to "meet successfully Atlantic weather—is to diminish the "amount of coal and the quantity of projectiles which the "ship was meant to carry; in other words, to clip the wings "and pare the talons of the most formidable sea-going ship "yet designed." In the late Controller's opinion, the builders of the *Devastation* have fallen into the same error as the builders of the *Captain* in adding weights which are perhaps improvements to the parts where they are applied, but which vitiate the sea-going qualities of the structure as a whole. It is impossible to imagine any system better calculated to fritter away personal responsibility, and to destroy that unity of design which is so essential in work of this kind, than the system which appears to be at present in operation at the Admiralty. It has taken four years to produce the *Devastation*, yet at this moment there are several important questions as to her load-line, coal supply, &c., on which definite information is still wanting. It may turn out that the unexpected power of the engines will make up for the reduced stock of coals; but of course this could not have been in the original calculations of the Council of Construction.

ITALY AND ANCIENT ART.

MR. RUSKIN is said to have declared some time ago that the greatest service England could render to art would be that of buying up Venice and devoting itself simply to the preservation of the City of the Lagoons. The proposal was a little extravagant perhaps, but it exactly expresses the feeling which deepens on one year after year as one passes through Italy. Great as is the ruin wrought in the past, it is as nothing to the perils which seem to be awaiting the scanty relics of art and antiquity which the past has left. The possibility of a war with France is the commonplace of every piazza. Yet the possibility of a war in Italy is, æsthetically speaking, of much the same order as the possibility of an Irish row in the British Museum, with the Elgin Marbles for barricades against the police, and the Hamilton vases for missiles. The School of San Rocco has been justly pronounced one of the three most precious buildings in the world to an artist, but an artist can still see the mark where an Austrian shell during the siege of Venice by Radetsky tore its way through the roof. By a special piece of luck the missile rested on the floor beneath without exploding, but the existence of eighty of the grandest of Venetian pictures hung on the caprice of a fusee. At this moment the Italian Government is planning new fortifications for Rome, and next year we may be trembling with suspense over telegrams of congratulation that, although the front of St. Peter's has suffered, the bombardment has not yet injured the Vatican, as we were trembling a year or two ago over the telegrams from Strasburg. But peace has its victories of destruction no less than war. The industrial revival of Italy is the most hopeful feature in its present condition, but docks and boulevards are terrible foes of the picturesque. Florence, with its new quarter, its widened and straightened streets, its restored churches and palaces, has almost ceased to be the Florence of Giotto or Machiavelli. The energetic Syndic who proposed to drive a broad road through the heart of Venice, and to turn the Piazza of St. Mark into an omnibus-stand, is still zealous to carry out his plans, and the choice of the city by the Peninsular and Oriental steamships must soon bring fresh warehouses of red brick to vary the line of palaces along the Grand Canal. Every one is crying for fresh house-room at Rome, and house-room can only be found by Haussmannizing the Esquiline and the Cælian. Already the whole district from the Baths of Diocletian to Santa Maria Maggiore is a wilderness of brick and mortar; the gardens of the Palazzo Massimi are changing into streets and squares; and a grand boulevard is charging straight on the Agger of Servius Tullius, and carrying mound and wall triumphantly before it. The Esquiline, however, has been doomed ever since the railway chose it for its terminus; but Roman progress is far from being content with the Esquiline. Perhaps the loveliest and most picturesque quarter of the older city is the space between the Lateran and Santa Croce, the square of desolate ground hemmed in by the grand line of the Aurelian wall, scored across with broken lines of aqueducts, and cut off from the modern city by the Wolkonski gardens and the grass-grown road which leads to the Porta Maggiore. There is no spot perhaps in Rome which is dearer to those who love the wild, solitary beauty that gives so strange a charm to the Eternal City; but to the Municipio and the architect it is simply an available space, and the dreamer who returns from his musings beneath its ruins may see hoarding in the Corso the

plan for covering it with "a fashionable quarter" and turning it into the Belgravia of the coming Rome.

It is of course useless to quarrel with the inevitable results of the revival of commerce or the return of population after so many ages to Rome; and we should be doing injustice to modern Italy if we supposed her indifferent to the antiquity or the beauty which her progress endangers. Whatever may have been the case a short time back, there is very little wanton destruction nowadays, and more harm is done in the name of art and archæology than through indifference or contempt. If a fresco is disinterred from the whitewash of centuries, if a painting is removed from the obscurity of a church to the local gallery, it seems to be found impossible to let it alone. Few events in the history of art are of greater interest than the recovery of the frescoes of Giotto at Florence, but in the memorable picture at the Bargello the figure of Dante has been changed beyond recognition, a squint given adroitly to his eyes, and different colours to his dress, while those at Santa Croce have been repainted from top to bottom till all identity is lost. Mr. Ruskin speaks somewhere of having witnessed the "restoration" of a Tintoret in the Ducal Palace at Venice by the simple ministry of a bucket of white paint and a mop, and we ourselves were privileged to see much the same kindly attentions paid to the pictures with which Veronese adorned the church in which he lies buried. There is in fact but a single untouched Titian in Titian's own city, the fresco of St. Christopher in the staircase leading to the Doge's apartments; and rumour attributes its preservation to the happy resolve of a resident Englishman, who, after discovering it in the seclusion where it had lain hid for centuries, flew at once to the Austrian commandant, and begged as a favour that it might be spared from the paint-brushes of the Academia. When the artists rushed upon their prey next morning, they found an unæsthetic sentinel posted before it, whose bayonet sufficed to save Titian and St. Christopher. Architecture has fared better than its sister art, but here again the tendency is to do far too much. We are no longer doomed indeed to witness such barbarous defacement of a great building as Florence witnessed under its last Grand Duke in the case of Santa Maria Novelle, or Rome under its last Papal ruler in that of the Minerva. But the latest news from Assisi is a good instance of the over-zeal which we deprecate as fervently in archæology as Talleyrand is said to have deprecated it in diplomacy. Since the suppression of the famous monastery a series of repairs, for the most part judicious repairs, have been undertaken by the Government, and the recommendation of the Commissioners appointed some ten years ago, that the wretched modern woodwork and rococo gilding with which the friars had loaded the church should be removed, has been rightly enough carried out. But the removal of the exquisitely worked choir-stalls erected by Maestro Domenico di San Severino in 1500, under the pretext of a wish to restore the church to the state in which its first builders left it, is a step which goes far beyond the limits of just restoration. Additions of really artistic value are a part of the history of any church, and in Italy, as in England, it seems difficult to drive into the head of modern architects that old buildings have a history as well as an origin. Italian buildings, however, are undoubtedly more lucky than Italian pictures. The restoration of St. Zeno at Verona, and especially the reopening of the confessional beneath the choir, has added a fresh grandeur to the grandest Romanesque church in Northern Italy. That of San Ambrogio has revealed beneath the chapel of St. Satyrus a crypt which seems likely to be the basilica of Fausta, the oldest Christian building in Milan. There is little to quarrel with in the care with which the invaluable mosaics at Ravenna are now being secured from further ruin; they are at any rate more fortunate than the mosaics of St. Mark's, where the guide tears down unhindered a handful of tesseræ for any gaping tourist who wishes to carry home a memento of his visit to the Lagoon. It is difficult to reconcile our mind to the restoration of St. Mark's itself, necessary as it seems to have been for the preservation of the building from ruin; but we may take the recent evidence of Mr. Hemans as proof that no wanton injury is being done. Signor Dorigo, like his predecessor, professes to adhere to the principle of simply repairing where repair is absolutely needful, and of using up again, as far as possible, the old material which he has temporarily displaced. The danger of such a process lies in the difficulty of abstaining from retouching, from sharpening the worn mouldings, or giving a fresh surface to the weather-beaten stone. At Murano, where the strictest principles of restoration were professed, the result has certainly been to give the well-known apse the look of a wholly new building. Unnecessary work should at any rate be religiously avoided, and the reported project for replacing the inimitable floor of St. Marco by a new floor of level mosaic can only be regarded as a job for the benefit of Signor Salviati and the works at Murano.

The municipality of Rome has given a proof of the importance which it attaches to the preservation of the monuments of the capital by the appointment of an Archæological Commission, who are charged with the inspection of all the excavations at present going on, and who are fast collecting a very respectable museum from the discoveries made in digging foundations for the new quarter on the Esquiline. The Commission, however, seems capable of playing odd tricks with the one great monument which ought just now to be its peculiar care. Neither the fragments preserved on the Aventine nor the larger portions rescued from the destroyer near the railway station can rival in size or importance the grand line of the Servian wall which has been exposed by one of the projected roads in a conventual garden near Santa Maria Maggiore. If we may trust, however, an official-looking announcement in the Roman papers, some enterprising Americans have coolly proposed to clear the road by transporting these stones across the Atlantic, and the proposal has been accepted by the Commission with every expression of gratitude. We are not told whether the Colosseum is to follow, and we may perhaps venture to regard the announcement as an indifferent joke; but there is the wall, and it is plain that if the whole of the Esquiline is to be traversed by straight streets and covered with boulevards and warehouses, the wall must go somewhere or other. The slowness with which Signor Rosa conducts his diggings in the Forum is a little provoking, but the discoveries of the past year have been of singular importance, and the point which he has now reached is one which can hardly fail to throw light on the general topography of the whole area. The angle where excavations have now commenced lies immediately in front of the well-known columns of the Temple of Faustina, and will probably reveal the steps which led up to the now buried Atrium before it, the original site of the mounted statue of M. Aurelius, which since the days of Michael Angelo has stood on the Capitol, as well as the Sacred Road from the Arch of Severus. The time must soon come when the whole area of the Forum will have to be cleared by the removal of the present ascent to the Capitol which so fatally bisects it at present, and of the side road in front of the church of Santa Martina, which now hides its communications with the great series of Basilicas and later Forums which stretched away to the Pillar of Trajan. It is not till this has been done that we shall be really able to look on the Roman Forum; but even now the space which has been cleared is sufficiently extensive to do away with the need for those apologies for its diminutive size which are still so common in our guide-books.

Here, in fact, as at the Palatine, Signor Rosa has done good work, but here, as there, half the value of his work is spoilt by his irrepressible propensity to what we must flatly call archæological forgeries. He likes to know the nature of everything he digs out, and he likes to give everything he digs out an air of completeness and prettiness. The visitor who looks on the larger expanse of the Julian Basilica is naturally a little irritated when he finds that all Signor Rosa found there were a few fragments of pavement, and that the long array of pillars which mark out its five aisles are simply of his own invention. The very fine sculptured slabs which were found last year near the column of Phocas have been topped and bottomed with fresh marble trimmings before they were set up for public inspection. On the Palatine matters have run to a far worse extent. Like everybody else, Signor Rosa has his theory of the Palatine, but, unlike everybody else, Signor Rosa can make the Palatine itself advocate his theory. He is master of the ground, and if he believes "Roma Quadrata" to have occupied a certain space, he prefers simply to build up a wall and label it "Roma Quadrata." A good many competent people believe the Temple of Jupiter Stator to have stood on the edge of the Forum. Signor Rosa, on the contrary, believes it to have stood in the central depression of the hill itself, which he calls the Mugonian Way. The one theory is perhaps as good as the other; but Signor Rosa has handicapped his own by simply building up a mass of brickwork where he believes the Temple to have existed, and sticking an official board on the top of it with the words "Temple of Jupiter Stator." As yet there are plenty of people who "mind the bigging of it," and the forgery, as we must call it, is a matter of more amusement than importance; but even now it is not every one who discovers the trick, and in later times a whole literature of controversy may eddy round the heap of brickwork. Compared with this sort of work, the merely fantastic absurdity of the bulk of these official placards is of little moment. We smile, of course, when a board informs us that in one corner was the "Home of Romulus and Remus," or in another that "Here Tanaquil addressed the People"; but in Rome every archæologist seems to take leave of common sense when he deals with the city's origins, and Signor Rosa is not a whit more credulous than his rival antiquaries. A year or two ago Mr. Parker was grateful to an Indian colonel who "confirmed Livy's interesting story of Romulus and Remus" by a wonderful narrative of a wolf who suckled a little Hindoo; and this winter Mr. Washington Wood informed his audience, with admirable caution, that "with the one exception, *perhaps*, of her alleged immortality, he saw no reason for doubting Livy's story of the Nymph Egeria." One can only respect a robust faith of this sort, but then faith should not bolster itself with spurious "Temples of Jupiter Stator," and we trust that Signor Rosa will drop henceforth the trowel and stick simply to the spade. Of researches in less known spots we have said little, because there is little to say. The catacombs at Syracuse are said to be yielding some fruit in the way of Christian antiquities, and a new series of tombs has just been discovered in Etruria; but for the most part archæological activity has been confined to the bigger towns. A real harvest, however, is yet to be reaped in more secluded spots, and we may hope that the Government will soon turn its attention to places like Capri, where former diggings have been spasmodic and unsatisfactory. It is strange to think what treasures of ancient art must still, in all reasonable probability, lie buried beneath Italian soil.

PRESERVATION OF IRISH ECCLESIASTICAL BUILDINGS.

SOME Oxford men may perhaps remember the time when there was—we believe it goes on no longer—a certain Theological Examination which led to no degree, which was required by no Bishop, which gave a man no advantage in standing for a fellowship, the passing of which in short did a man no good in any way. It gave him, to be sure, the title of Candidate in Theology. But, as a rule, the position of a candidate is not one which men seek for its own sake, unless the candidature seems likely to lead to something more solid than the mere title of candidate. So at least it is in worldly affairs, and experience showed that human nature was not very different when it came to be employed on theological subjects. Three Examiners were solemnly appointed at the proper times; a formula was drawn up for announcing, after the manner of a class-list, the names of those who passed the examination and so became entitled to the name of Candidate in Theology. Yet, as perhaps all people expected except the authors of the scheme, the number of those who came forward to be examined was not large. Once however, from what motive it is not recorded, a man did present himself. The three Examiners sat in due state; the candidate, if a man can be called a candidate who is not seeking any more definite object than to be described as a candidate, appeared before them. They put their questions; he made satisfactory answers; the result had to be announced in form, but unluckily the plural form designed for the document would have been a breach of truth; the number had to be altered, and the *quasi*-class list, the list of one candidate, had to begin, not with "nomina eorum," but with "nomen ejus." Here we have a list of one, and another Oxford remembrance may perhaps vividly bring before some memories what was meant by "a procession of one." Now we have lately come across a procession of one where we should certainly by our unassisted reason have looked for a much greater company. When the Irish Church Act was passed, it seemed to us and to some others a great point to secure those countless ecclesiastical remains, churches, cells, bell-towers, which are scattered up and down the whole land, against any injury which might be the result of the necessary change of ownership. Ruined and forsaken as they were most of them, quite unfit to be put to any practical ecclesiastical purpose, they were still in every sense historical memorials, and many of them exhibited most curious and instructive architectural forms. We hoped that something at least had been gained by the twenty-fifth clause of the Act, which vested, as we fondly thought, all buildings of the kind in a public functionary with a view to their preservation. The paragraph of the clause with which we are concerned runs thus:—

> Where any church or ecclesiastical building or structure appears to the Commissioners to be ruinous, or, if a church, to be wholly disused as a place of public worship, and not suitable for restoration as a place of public worship, and yet to be deserving of being maintained as a national monument by reason of its architectural character or antiquity, the Commissioners shall by order vest such church, building, or structure in the Secretary of the Commissioners of Public Works in Ireland, to be held by such Secretary, his heirs and assigns, upon trust for the Commissioners of Public Works, to be preserved as a national monument, and not to be used as a place of public worship, and the Commissioners shall ascertain and by order declare what sum is in their judgment required for maintaining as national monuments the churches, buildings, and structures so vested, and shall pay such sum accordingly to the said Secretary, to be held upon trust for the said Commissioners, and to be applied by them in maintaining the said churches, buildings, and structures.

We had fondly hoped that a very large number of churches and other ecclesiastical buildings would, under the terms of this clause, have been set apart for preservation. We had always thought that the number of ecclesiastical buildings in Ireland which are quite unfit to be used as places of public worship, but which are worthy of being preserved as national monuments on account of their architecture or antiquity, was greater than could be found in any other part of Christendom. Their prevalence is one of the most marked features of the country. There is no other country where all the ancient village churches, and several of the cathedral churches to boot, are no longer used for public worship, and have fallen into a state which makes them quite unfit to be restored for purposes of public worship. And there is no part of Christendom in which buildings of this kind are more worthy of being preserved, not indeed on account of their size or magnificence, but on account of their vast antiquity and the remarkable forms of their architecture. We of course bear in mind that the ruined monastic churches, which are also a characteristic feature of Ireland, do not come under this head. They are not ecclesiastical buildings in the sense of the Act. That is to say, they were not in ecclesiastical ownership at the time of the passing of the Act. They had passed to the Crown at the time of the dissolution, and from the Crown of course in many cases to private owners. With these therefore, with such buildings as Holy Cross and Hoar Abbey and the endless Friars' churches, the Act had nothing to do. But, leaving them out, the ruined cathedral and parochial churches with their adjuncts would make a far longer list in Ireland than anywhere else. We should have thought that every one of them was worthy of being preserved as a national monument. Our surprise therefore was great when, in answer to a return moved for on March 13th, by Mr. Agar-Ellis—a return "of all National Monuments provided for under Sub-section I. of Section 25, Irish Church Act"—the return itself made its appearance before the House of Commons in the form of a procession of one. One monument, at least one group of monuments, only had been thought worthy of being set apart for preservation under the terms of the Act. Now undoubtedly, if we were to be placed in the same kind of hard strait as the wife of Intaphernes, if all the ancient monuments of Ireland were going to be destroyed, but we were allowed to save one monument or one group of monuments, we should make the same choice which the Commissioners have made. For the list of one, the "nomen ejus," the single name to be found on the Commissioners' return, dated "Office of Public Works, March 19, 1873," and signed E. Hornsby, Secretary, runs thus:—"The Ecclesiastical Ruins on the Rock of Cashel, County of Tipperary." This is the beginning and ending of the document. Now the ecclesiastical ruins on the Rock of Cashel would clearly be the one thing to save, if only one thing could be saved; but when it is open to the Commissioners to save everything if they please, we cannot understand why they should so calmly make up their minds to save the ecclesiastical ruins on the Rock of Cashel only. Nor do things seem to be much mended when we come across a Bill "to provide facilities for vesting the Rock of Cashel in Trustees," which stands for its second reading on some day in the Whitsuntide recess, and is therefore likely to fall by a fate hardly less ignominious than that to which it succumbed last year, when it was wrecked on Standing Orders. If this Bill had the slightest chance of being seriously entertained, we should have a good deal to say about it. As it is, however, a scarcely concealed manœuvre to relight the flame of religious discord in Ireland by appropriating to Roman Catholic uses a monument which by general consent was to be preserved as the common property of all Ireland, we may safely dismiss it without further notice.

But, to come back to our own subject, surely Commissioners and Secretary and everybody else concerned, no less than the proposers of the new Bill and the Trustees whom they propose to name, must know that there are other places worth saving as well as Cashel. Surely, if they have gone nowhere else and seen nothing else, they must some time or other have made the tour which everybody makes to the Seven Churches of Wicklow—that is, the old Cathedral of Glendalough and its surroundings. We really thought that all the world had heard of St. Kevin's Kitchen. We can hardly suppose that the Commissioners and all the rest of them look on the churches of Glendalough as in a fit state to be restored for public worship of any persuasion. The only alternative then is that they mean deliberately to pronounce that these buildings are not worthy, on account of their architecture or antiquity, of being preserved as national monuments. Why the very tourists would cry out if the Seven Churches were done any damage to. Or are the Commissioners misled by the name "kitchen," and do they think that neither the so-called kitchen nor any other of the Glendalough buildings are ecclesiastical buildings, and that therefore they have no part nor lot in the matter? The document is dated from Dublin; has no one belonging to the Office of Public Works ever gone so far out of the city as to get a sight of St. Doulough's Chapel? It is surely an ecclesiastical building; it is surely, from its architecture and antiquity, worthy of preservation as a national monument. And, to keep again within the neighbourhood of Dublin, is there not Clondalkin Round Tower, which we thought everybody went to see, even those who do not go to St. Doulough's? Is there not further off Clonmacnois, Monasterboice, a crowd of places—all the places, one might say, which Dr. Petrie took so much trouble to draw and describe press at once on the mind of any one who knows anything of Irish antiquities—but perhaps they are too far from Dublin for any one belonging to the Office of Public Works to know anything about them. Still we should like to know what is to be done with the puzzling case of Kildare Cathedral, the Irish Llandaff, with its nave in ruins and its choir rebuilt and recast in a form of the most ingenious ugliness. Surely something should be done to it; either the nave can, after the happy precedent of its Welsh fellow, be restored for purposes of public worship, or it cannot; and if it cannot, surely it is one of those national monuments which most deserve to be preserved on account of their architecture and antiquity. But, at any rate, it should not be left altogether to shift for itself in the way in which we saw it some years back.

There is certainly something very perplexing to the untutored mind in the fact that a public body should in this way declare that in all Ireland there are no ruined ecclesiastical buildings, except those on the Rock of Cashel, which are worthy of being preserved as national monuments. They cannot, like Mr. Ayrton, look on them as vaults, for a vault is just the thing which in Ireland is hardly ever seen. But we think that we have hit on the explanation. The Commissioners and the Office of Public Works are perhaps still in the pre-scientific stage, or perhaps they have hearkened to Mr. Brash or Mr. Marcus Keane. One would have thought that all the Round Towers in Ireland would at once have been put down in the return. But perhaps the officials have not read either their Giraldus or their Petrie; perhaps they do not know that "ecclesiasticæ turres" are "ecclesiasticæ turres"; perhaps they think that they are the wicked idolatrous erections of Phœnicians, Buddhists, or Cuthites; perhaps they may even, like the hapless O'Brien, see in them the demoralizing works of the degraded votaries of abominable mysteries. As such they perhaps think that they do not deserve the name either of ecclesiastical buildings or of national monuments. If so, we quite agree with them that it would never do to restore them for that kind of public worship for which they think that they were set up. But surely nationality might strain a point: surely, in an island where so many races have settled, from

Scotta the daughter of Pharaoh or the still earlier lady with a name something like Cæsar who landed on a Tuesday before the Flood, surely here at least all peoples, nations, and languages might agree to look on anything that has been ever built on the soil, whether by Phœnicians, Milesians, Scythians, Celts, Saxons, or anybody else, as all entitled to the rank of national monuments. We really may fairly ask the Commissioners and everybody whose business it is to look a little further afield, to give us some kind of security that not only the ruins on the Rock of Cashel, but the ecclesiastical ruins generally throughout Ireland, unique and precious as they are in many ways, may be put out of the reach of wanton destruction or damage. They are national monuments in the fullest sense; monuments in which every man in Ireland, of whatever race or religion, has an interest; monuments in which every man everywhere, who cares for one of the most curious pages in the history of Europe and of Christendom, has an interest hardly less deep.

A FEW SPRIGS OF MAY.

THOSE who believe that Ultramontanism and Ultraprotestantism grow from a common root may perhaps find some confirmation of their belief in the avidity with which the devotees of each, year after year, welcome the month of May. The First of May, so long regarded in Christendom as the feast of two Apostles, seems now almost exclusively to be observed in the Continental churches as the first day of the "month of Mary." We lately heard an eloquent preacher open the May campaign of 1873 in the presence of a crowded auditory in the Dom at Cologne. He remarked that the Almighty, in creating and giving character to this month, seems to have foreseen that it would in time become known in the Church as the month of the "Himmels-königinn." He drew picturesque analogies between May in Nature and May in Grace. It struck us, indeed, as he poured out his imagery of flowers, blossoms, singing-birds, sweet scents, and the blue heavens, that he was rather describing May as it ought to be than the May we have been enduring. But he may possibly have regarded the rain and the cold winds as fit accompaniments for the May in which the promulgator of the Immaculate Conception is a prisoner in the Vatican.

It struck us at the same time that, if one might take the preacher's principles and leave out his illustrations, he was providing an admirable skeleton sermon for an English Evangelical or Dissenter in the month of May. The May meeting season (which is now obliged to begin in April, and is not able to finish until June) is the Pentecost of English Evangelicalism. The peasantry of the Rhineland villages cannot think of May more ecstatically than our own Protestant "Christians from the country visiting London"—to use the words of a lodging-house advertisement in a religious newspaper. An Independent minister has idealized the month's activity, this very year, in a May sermon, as "the gathering of the tribes." Ladies hail cabmen with their parasols, and before stepping into the vehicle ask the driver if he plies on Sunday; every third or fourth Jehu receives a tract along with his fare. Scarcely an omnibus passes Exeter Hall, morning or evening, without setting down one or more "insides" at the sacred porch. The porch itself nearly always contains a group of persons studying the advertisements of the different entertainments for the season which hang upon its walls. Pedestrians in the Strand may now and then catch a glimpse of a "great religious nobleman," sitting stiffly erect in his open carriage, like the king of May in a triumphal car, on his way to that central seat upon the platform which is the throne of the evangelical May king. Evangelicals agree with the Ultramontanists in keeping their holy and happy month in a jolly and rollicking manner. "Safe" amusements are provided, as a relaxation between meetings, for the Evangelical young man and young woman from the country. Bazaars abound in all the suburbs. In the strictest of sects the year's marriages are arranged.

A concert given by a truly converted company of nigger melodists appears to be the most popular entertainment offered during this present May for those who do not go to the theatre. "The Coloured Jubilee Singers" arrived from America, most opportunely, at the very beginning of the month. They gave a private rehearsal and taste of their quality before a select aristocratic and clerical audience at Willis's Rooms as soon as possible after their arrival. Lord Shaftesbury presided; invitations were accepted by "the ministers of our leading denominations." Their Barnum, if they possess one, evidently hit the mark. Every tinge of worldliness, every suspicion of secularity, was banished from the entertainment at the very commencement. The *Christian World* declares that "the opportunity was a very auspicious one for the singing band, and there can be little doubt that it will serve as a fine introduction to the English public." It appears that the singers are students of the "Fisk University," and propose to gather a sum of money for their learned mother by giving concerts in Europe. We trust that their health will not suffer by studying all the day and singing all the night. It is a novel and quite a Yankee reproduction of the travelling beggar-scholarship of the middle ages. Such lovers and martyrs of learning will certainly never permit their songs to interfere with their studies. Indeed the character of their songs will show their audiences what a mass of study still lies like an obligation upon them. They have to pour out such vile and atrocious English at night that it must require very hard labour indeed in the day to form or keep the least acquaintance with pure English. Their entertainment shares the generic character of all other "nigger entertainments"; it is in part pathetic, in part comic. The pathetic element is perhaps not unsuited to the "Month of Mary"; for, if we may judge from the title given to one of their songs, "Steal away to Jesus," it partakes somewhat of that kind of sentimentality which that devout Marian, Father Faber, introduced into English hymns. A converted "Josh Billings" seems to have provided the comic infusion, which is produced mainly by bad spelling and by mispronunciation. The students will perhaps be cured of the two bad habits they are forming when they give up singing and go back to Fisk University to turn their attention to learning. What fun these expedients cannot supply, the singers attempt to call forth by wretched abuses of the language of Scripture and perversions of the meaning of English adjectives. They sing about the devil as "old Satan," and the King of Egypt as "old Pharaoh"; they imply that to be good one ought to be young. It must be refreshing to Mr. Bradlaugh to read that a solemn conclave of noblemen and preachers uproariously encored "Go down, Moses." No doubt some of the noble and clerical Sunday lessees of the theatres and music-halls were present; and we shall not be surprised to learn that they have serious thoughts of engaging a few comic singers and break-down dancers for their next campaign. The religious world seems already to indulge some hope that this nigger entertainment may assist it in converting the other world. The world which does not call itself religious was admitted, upon payment, to share in this elevating treat of the religious world, a few days later at the Hanover Square Rooms. The wicked world was at least impressed; for another religious newspaper reporter tells us that "a fashionable West-end audience smiled when the darkest female singer of the group, looking straight into their faces, sang out in the sweetest but most uncompromising manner,

> If you want your souls converted
> You'd better be a prayin'.

We," says the reporter, "could not help thinking that, although the advice occasioned a smile, it might leave a not unwholesome impression." We have all the elements here of a totally new sensation; the religious world and the other world can meet and rejoice together as one; the religious world can laugh and feel that it is doing good, the other world can laugh and be unconsciously getting good; the raw students of America may become the religious doctors of the fashionable world of London. We notice that the devil has again become with these Yankee Puritan entertainers what he was with the Catholic entertainers of the middle ages—the most comical of characters. They sing:—

> If you want to see old Satan run,
> You must shoot him with the Gospel gun.

A third reporter assures us that they sung this "without any levity." It is quite probable; though it is not so probable that an English audience, presumably intelligent, can listen to it without either levity, or disgust, or contempt.

While we are speaking of the May amusements of the Evangelical world, it is quite natural to think of Dr. Cumming. After being amused, there is nothing which the seeker for religious excitement enjoys so much as being frightened. Dr. Cumming has probably done more than any other man to frighten the class of persons who still regard Exeter Hall as the centre of the universe. Others may supply them with their farce and comedy, he has supplied them with their tragedy. We had lost sight of the prophet ever since he was hoaxed about the Pope's death. We are glad to see that May has brought him out again, and to learn two new and very important facts in his autobiography, and in the biography of his famous contemporaries. Our joy is a little dashed, however, by finding him so hopeful; he does not seem to be overwhelmed by any fear of the immediate end of all things. The sudden appearance of Prince Bismarck, and the place taken by Germany in the affairs of the world—so unprovided for in all the Doctor's casts of the future—may be the cause of his cessation from prophesying. He has appeared twice on the platform of Exeter Hall during this present season. Each time he naturally came forward to speak for some popular and reputable Society, and as the companion of peers and bishops. He graced the platforms of the Bible Society and of the Religious Tract Society. When the Earl of Aberdeen had seconded some resolution at the meeting of the Bible Society, the Doctor not only told him that he had "consecrated his dignity," but hastened to inform the audience that he had "had the honour of seeing the Earl before." The audience must have realized in a moment what a gulf yawned between the privileged speaker and themselves. But we learn from the report of the Religious Tract Society's meeting that the Doctor has been doing even more wonderful things since we last heard of him than seeing earls. His chapel stands near a great number of theatres, or, as he oddly puts it, "is the centre of eleven theatres." Actors, actresses, and scene-shifters seem to regard Crown Court Chapel, in his opinion, as their mother-church. They go in "occasionally," the Doctor says, "and take a mouthful of living bread and go away." Some of them have discerned so much similarity between Dr. Cumming's entertaining or harrowing sermons and their own burlesques or melodramas that they have proposed a kind of truce, if not a fellowship, between Scotch Presbyterianism and the modern stage. They thought that if they went to Dr. Cumming he might also go to them; they thought that, as they never disparaged him, he ought to cease from disparaging them. They said in effect, *vulgariter*, that two of a trade ought to agree. One actress even asked the author of so many visions and illusions to

come and see her in *Manfred*. The Doctor made a compromise; he would not go into the theatre itself, but he went to the door of it and bought a copy of *Manfred*. On the following Sunday night the Crown Court congregation was treated with a commentary on Byron by Dr. Cumming. We gather, however, from the close of the Doctor's account that the cessation of hostilities is regarded by him as impossible. He will be very glad to see all the actors, actresses, and scene-shifters of the eleven theatres gravitate each Sunday to their "centre"; but he cannot promise them to abstain from attacking the profession or business by which they get their bread. With exquisite taste and delicacy he lumps together Macready and the stage-carpenters, Grisi and the scene-shifters, as "the theatre people"—much as the scene-shifters may lump together the great seer and his pew-openers as the "Scotch chapel people." He has supplied the compilers of biographical opera gossip with an interesting (we should say the most interesting) fact in the life of "Madame Grisi, a celebrated actress." It seems that this great singer was not only amongst those who "came in occasionally and took a mouthful of living bread" from Dr. Cumming's hand, but that she received a permanent good; "she came to a knowledge of the truth as it is in Christ" under Dr. Cumming's preaching. When she went away from London she told the gentleman in whose pew she had often sat, that she "was very sorry that she should not be able to hear the Doctor preach any longer." How much of the pathos which thrilled the souls of Russians in St. Petersburg and of Frenchmen in Paris may have had its secret spring, not in her sympathy with the theatrical character she was for the time assuming, but in the profound need felt in the depths of her own heart of those unattainable Friday evening sermons of Dr. Cumming's!

The most exuberant gladness of our English May-keepers during the present season has been called forth by allusions to the field for sectarian exercises now opened in Rome. Whenever a speaker felt that he was growing heavy and unacceptable, he had merely to shout out, "Rome is open to us!" "The Gospel in Rome!" "Methodism in Rome!" "A Baptist chapel in Rome!" "Christianity preached under the shadow of the Vatican!" or some such catchword. The Evangelical Societies really seem to think that the Italian nation is in some unexplained manner half indebted to them for the possession of its capital. A Mr. Van Meter, who had been "labouring" in Rome, was even a greater attraction at the meeting of the Religious Tract Society than Dr. Cumming himself. The moment Lord Shaftesbury told the audience from what part of the world the Society had imported this star, the noise and glee were uproarious. He could not have been better received if he had brought the Pope's head in his hand. Mr. Van Meter gave the audience the usual summary of the history of Latin Christianity in its centre. The first great event in Latin Christianity was the entry of St. Paul into Rome as a prisoner. Then came a long blank; "for eighteen hundred years Italy was down in the dust, and clothed in rags." At last the gates of Rome were opened again to admit hope and life to Italy. Two great persons entered the gates; first, Victor Emanuel, King of Italy, with his army and his artillery; secondly, Mr. Van Meter, "with a cart drawn by a dog, piled with copies of the Word of God, God's own artillery." When the audience heard that cruelty to animals and relief to Protestants thus entered together, they broke forth into "great applause." We must do Mr. Van Meter the justice of saying that he does not seem to be pleased with using the dog as a beast of draught and burden, for he closed his long speech with a request that some liberal friend would give him 25*l.* to buy a donkey. This request, like other parts of his speech, was received with "laughter." If Mr. Van Meter could study the history of Italy during the eighteen hundred blank years in which he thinks it was waiting for his advent upon his donkey, he might possibly begin to have some glimmer of a sense that the Evangelical joking and fussy intermeddling of impertinent foreigners will not do much to clear up either its religious or political difficulties.

BIRMINGHAM SCHOOL.

PARLIAMENT has again been invited to consider the schemes propounded by the Commissioners under the Endowed Schools Act. Sown in ambiguity, the fruits of that measure are being reaped in discord, which will not be appeased unless the Educational Department will combine with the Commission itself in consenting to adjourn the legislative functions of that body during the short period which still remains before Parliament can reconsider its attributes under the light of a four years' experiment and a searching inquiry by Committee. In the few days which elapsed between Lord Salisbury's notice of motion to reject the Birmingham School scheme and the actual debate, an ancient fog had somewhat suddenly been lifted from the political atmosphere, and the House of Lords found itself able, in clear daylight, to consider the hazy proposals of a bothered and errant Commission. It can hardly be denied that it has for a considerable time been the accepted tradition of political wirepulling that, because the Church of England is old, is established, and is (to an extent which the Nonconformists forbid us to investigate) the religion of the majority, therefore, in order to redress a numerical balance by the concession of inordinate privilege to the other side, that Church is in all cases, when a compromise with Dissent is in question, to be treated with something less than equal justice. This principle explains the action of the Government upon the Burials Bill; it is the secret of the humiliating abandonment of the religious census, and it lies at the bottom of the policy of the Endowed Schools Commission; while the genuine surprise and rage of the sectaries at Mr. Forster's refusal hitherto to let them tear out the 25th clause of the Education Act shows how thoroughly the political inequality of Churchmen has become the recognized interpretation of religious equality. All this is, however, considerably changed since the House of Commons, in full presence of that which it pleases the Opposition papers to style the "suspended general election," effectively declared on Friday night that the Church of England broadly and deeply represents the affections as well as the wants of the people, and has the same claim as any other community, large or small, to be judged by its own performances rather than by the interested representations of rival organizations. We have put the religious aspect of the Birmingham School scheme foremost, not because we consider it more reprehensible than the other shortcomings of the plan, but because, under the influence of the exploded prejudice as to the unpopularity of the Church, the Commissioners and their friends, while exemplarily ready to make Jonahs of other elements of their scheme, cling with exceptional obstinacy to this one favourite recommendation.

Lord Salisbury truly said that, in addition to Mr. Forster's general promise of immunity to the good schools, the "understanding" that the Church of England should not be interfered with in the "management of schools which the founders had intended should belong to her" helped to pass the Act of 1869; and he went on to show that this concession had been embodied in the most liberal conceivable terms—namely, by an enactment giving the like protection to the Denomination schools of all communities:—

> [After the special exemption of Cathedral and Collegiate Church Schools] (2) Any educational endowment, the scholars educated by which are, in the opinion of the Commissioners (subject to appeal to Her Majesty in Council, as mentioned in this Act), required by the express terms of the original instrument of foundation, or of the statutes or regulations made by the founder or under his authority, in his lifetime or within fifty years after his death (which terms have been observed down to the commencement of this Act), to learn or to be instructed according to the doctrines or formularies of any particular Church, sect, or denomination is exempted from the foregoing provisions respecting religious instruction, and attendance at religious worship other than the provisions for the exemption of day scholars from attending prayer and religious worship, or lessons on a religious subject, when such exemption has been claimed on their behalf, and respecting the qualification of the governing body and masters, unless the governing body, constituted as it would have been if no scheme under this Act had been made, assents to such scheme. And a scheme relating to any such school or endowment shall not, without the consent of the governing body thereof, make any provision respecting the religious instruction or attendance at religious worship of the scholars (except for securing such exemptions as aforesaid, or respecting the religious opinions of the governing body or masters).

The religious character of Edward VI.'s School at Birmingham was embodied in the provision of that King's Charter, dating, be it remembered, in the year 1552 (that of the second Prayer Book) and runs as follows:—

> The governors, with the advice of the bishop of the diocese for the time being, from time to time may make, and have power to make, fit and wholesome statutes and ordinances concerning the order, government, and direction of the school.

Lord Salisbury's contention was that when, at the time of the most sharply cut religious division of which English history furnishes any record, the local chief pastor of the Established Church was emphatically set up as the referee upon the teaching of a special school, the inference was that that teaching could only be intended to be in accordance with the faith of which that chief pastor was the appointed guardian. With our best endeavours to help Lord Lyttelton and his colleagues out of their muddle, we cannot see that this proposition involves a logical absurdity; and yet the noble first Commissioner said on Tuesday night that "it was impossible by any reasonable construction to bring this case under the 19th section of the Act;" and so the Commission, after decreeing (as by the Act they were in their view of facts bound to do) that the Head-Master need not only be no clergyman, but no Christian at all, contrived to substitute for the advice of the bishop the vague provision that, "subject to the provisions herein contained" (the conscience clause), "the Governors shall make proper regulations for the religious instruction to be given in the several schools." For this purposeless enactment the governors of the school, supported by Lord Salisbury, proposed to substitute the really not more tangible amendment, that the instruction was to be in the fundamental tenets of the Christian faith, those fundamental principles having to be settled by a governing body which might very possibly comprise Baptists, Roman Catholics, Unitarians, Jews, Anglicans, Swedenborgians, and Positive philosophers. Our sympathies are with Lord Lyttelton when he asserted, in answer to this suggestion, that "the Commissioners would never undertake to indicate any definite and specific religious teaching for schools in their schemes, unless they could connect it with some well-known standard of a religious body." But this protest against the absurdity of indefinite "fundamental tenets" was no justification to the Commissioners for adhering, as they did, to their existing scheme under the specific circumstances of the evening. As we have had already occasion to urge, their adherence at this moment to any particular scheme is purely gratuitous. The one certain fact is, that they came into office under an impression that their appointment carried with it securities for Denominational schools, which have been

shown not to come within the Act; while even Lord Lyttelton himself did not venture to assert that the particular provision in the Birmingham Charter was not, apart from its absolute legal force, an intimation—unquestionable in itself, and continuously acted on—of the religious intentions of the founder. The renewal of their powers is about to form the subject matter of a Bill, in which the various defects which have been discovered in the Endowed Schools Act may be set right. Therefore, even if they could not have acted differently under the existing Act, what was there to prevent the Commissioners from consenting to let their first scheme be negatived, in order that under a fresh statute they might be enabled, with due regard to the claims of conscience, to do substantial justice to the religious principles indicated in the Charter of Birmingham School? They had in evidence the words of that document, with the unquestionable intention underlying them of founding a Church School, while, in accordance with the spirit of the 19th clause of the Act, this "regulation, made by the founders, or under their authority," had "been observed down to the commencement of this Act" by the institution in Birmingham of a Church School, tempered by a most liberal and successful conscience clause. The regulation was ostentatiously no grievance, or else, out of the 1,800 scholars, 800 would not have been Nonconformists, nor would Mr. Fry in his Report have spoken of the working of the institution in language of exceptional compliment. There was nothing on the other side except the verbal inadequacy, which we are willing to concede, of the 19th clause to meet the substantial facts. Had the Commissioners been in the heyday of their early powers, with little prospect of further legislation before them, they might have shrunk from provoking fresh debates even in face of a case possessing such strong claims to be separately considered. But in this Session, with a Bill not only promised but indispensable, unless the Commission is altogether to collapse, and with the golden bridge built for them of a quiet rejection of their scheme, we cannot acquit the Commission of obstinate perverseness in preferring the humiliation of a direct defeat. It is idle to appeal to the claims of any higher law of religious justice constraining them to stick to their proposals. So long as the principle of a conscience clause was under the ban of Church circles, Nonconformity had without doubt a large substantial grievance; but inasmuch as this very Endowed Schools Act was taken advantage of by Churchmen to retreat from an extreme and untenable position, the special objection to Church foundations disappeared with the particular disqualification of which it was too often the symbol. On the other side, if the Endowed Schools Commissioners had begun by making the hearty acceptance of that conscience clause one of certain specific tests of the goodness of the schools which they were overhauling, instead of changing for the mere sake of novelty the constitution of every one which they approached, they would have engaged in a less sensational task, but the solid results of their work might not have led to such a narrative of repeated disappointments as stands confessed in their Report of 1872. At Birmingham, at all events, where the conscience clause has been so long and thoroughly engrafted on the system of the school, there was no pretence for the hard application in its reform of any rules over which they possessed discretionary authority.

We gladly leave the polemical chapter of the controversy for questions which moderate men of all opinions may discuss with no fear of the intrusion of the theological hate. But we have no space to dwell upon those portions of the scheme which have a merely local value. The prospective removal of the school from the town to the outskirts may be a proposal absurd in itself, and the reduction of the Head-Master's stipend and authority may be a heavy blow to the efficiency of the institution, but these are details which particularly concern Birmingham. The projected composition of the future governing body involves considerations of a general, and therefore a national, nature which can be discussed quite apart from the question of the value of founders' intentions, on which so much of the Emanuel Hospital controversy turned. Two blacks do not make a white, and any shortcomings which the Commissioners may have supposed themselves to have discovered in the governing body which they were superseding would not be the slightest justification for creating, in the case of King Edward's foundation, the precedent of a constitution elaborately combining all the elements most likely to ruin the good working of a school especially intended to foster higher culture in its many branches. The new governing body, as proposed by the Commission, was to have been a composite Board, of which the majority was to be chosen, for fixed terms, by those two emanations of that peculiarly refined and scholastic community, the householders of Birmingham—the Town Council and the School Board—while the minority (temporarily taken from the actual governors) was hereafter to be "cooptated"; that is, each successive vacancy was to be filled up by the votes of the remaining body, of which from the outset the majority would be the representative by a feeble secondary election of a wide and unchecked democracy. In other words, this majority would have had the perpetual power of creating life-peerage seats upon the Board for members of its own party, with the certainty that, under the efflux of time, the whole body would ultimately be reduced to its own complexion as every successive election strengthened its majority, and diminished such powers of conservative resistance as the residue of the older governors might at the outset retain. We have far too many calls upon our time to waste words in criticising the surrender of a great public school, such as that of Birmingham has been made under a series of eminent Head-Masters, to the control of the Birmingham householders. In face of such a calamity, we are not disposed to be too hard upon the much impugned clause in the scheme which gives summary powers to the Charity Commissioners for altering the constitution of the school in the coming time. After the worst has been said of that well-abused body, its bitterest enemies must acknowledge that the Charity Commissioners would probably be able to compete in refinement, in legal lore, and in the appreciation of the benefits of a liberal education, even with the lambs of the Midland capital. Here again we are willing to make every possible excuse for the Endowed Schools Commissioners at the outset of their disagreeable operation. They were now to the work, and Birmingham is not only a big, but a noisy place, and possesses (though not so incontestably as two years since) a large influence in social and political controversy. Besides, they were hampered with the provisions of an Act in the working of which they are ever ready to show themselves not only scrupulous, but timid. These, we say, are excuses which might have been advanced on their behalf for having drafted the scheme. But, as we have already argued, such considerations afford no palliation for Lord Ripon and Lord Lyttelton daring the censure of the House of Lords, when the acceptance of Lord Salisbury's motion could have led to no more serious result than the reconsideration of the Birmingham scheme, under such amended powers as may be conferred upon the Commission by the Bill which is needful in order to continue its existence.

THE CONTAGIOUS DISEASES ACTS.

WE are obliged once more to return to the discussion of this very unsavoury subject. Fortunately, as the discussion continues, the issue seems to be growing more simple. It is coming to be more plainly than ever a dispute between statistics and sentiment. One side appeals to facts; the other to prejudices, which are supposed to be a sufficient reason for themselves. Mr. Mundella showed very plainly the shifts to which the sentimentalists are reduced when he accused an awkward witness on the other side of lying. This method of argument is delightfully simple; but it is only too widely and easily applicable. There would, indeed, be some difficulty in retorting it; for the simple reason that the opponents of the Acts seldom indulge in any statement of facts. They generally escape any imputations on their veracity by pledging themselves to nothing. The debate having taken this form, the decision of Parliament is all the more satisfactory. Declamation was not allowed to have its own way; and, in spite of all the clamour which has been raised, and which might be expected to be powerful at a time when members are beginning to think of their constituencies, a majority of nearly two to one has given a decision in accordance with the weight of argument. It is remarkable moreover that public opinion appears to be running strongly against the agitation in the towns where the experiment has been tried. One of the ablest speeches in favour of the Acts was made by Mr. Lewis, the member for Devonport; and he professed, we have no doubt accurately, to be speaking the general sentiment of his constituents. We may then be permitted to hope that we are gradually seeing our way to the end of an agitation which could never have been regarded with much complacency even by the more reasonable opponents of the legislation. It has illustrated some rather singular truths. It has thrown a very unpleasant light upon the good taste and political wisdom of the ladies who are most anxious to exalt the dignity and develop the intellect of the sex; it has shown what a disturbance may be made by a few determined agitators with a telling bit of popular claptrap; it has, we fear, shown also how the dread of such an outcry may prevent politicians from uttering their general convictions plainly and openly; but we may be permitted to hope that it will also prove that mere popular declamation is not yet omnipotent in the country.

The argument may, in fact, be summed up very shortly. We have on different occasions gone at some length into the statistics of the question; and we have little to add to that part of the subject. The last returns, however, strikingly confirm the results already obtained, and seem to give a conclusive answer to one argument by which it was endeavoured to evade their force. The tables recently published show that at the military stations protected by the Act the number of cases of the worst class of disease had sunk by a steady process from 120 per 1,000 of the average strength to 54·2 per 1,000 between the years 1865 and 1872. In the unprotected stations the ratio in the first of those years was 99·9, and in the last 123·1. In other words, the prevalence of the disease has been in one case diminished by one half; in the other it has increased. It used to be said by the opponents of the Acts that the diminution in the prevalence of disease was due to more general causes; and that the disease was diminishing without as well as within the protected area. That argument must now be abandoned; and it must be admitted that, so far as statistics can prove anything, they prove that a very great improvement has been effected in the health of the troops.

In another direction the evidence is equally one-sided. The main argument against the Acts was their supposed tendency to degrade the unfortunate women brought under their operation. Recent reports assert, on the other hand—and we see no reason to doubt their accuracy—that a very marked improvement has been produced. One main result has been the suppression of the horrible system of juvenile prostitution. A systematic supervision has

enabled the police to restore to their families a number of very young girls who were sinking into utter degradation. Moreover, the testimony of clergymen, medical men, magistrates, and others, to the improved decency of the women generally, is overwhelmingly strong. By a system of judicious classification the less corrupt can be secluded at the hospitals from the evil influences of their companions, and many are induced to reform by the clergy and other visitors. The grossest haunts of vice have been suppressed, and women who had previously known nothing but brutality have been humanized when brought under moral and religious instruction. It may be necessary to make some allowance for the favourable view which the administrators of a law naturally take of its working, but we see no reason to doubt the general accuracy of the statements made as to the improved decency of the women; not only because the improvement is positively affirmed by competent witnesses and scarcely denied by adversaries, but because the cause assigned seems to be adequate to the alleged effect. After all that has been said as to the brutality of the Acts, it must be remembered that they for the first time provide a machinery for systematically bringing this unfortunate class under some kind of civilizing agency.

We may thus pretty well take for granted, what is now scarcely denied, that the Acts have materially diminished disease, and have improved the decency of the women. The only question between the opponents and defenders of the Acts is whether these advantages are bought at too high a price. Such orators as Professor Newman and Mrs. Josephine Butler scorn to be bound by any appeal to statistics. They rely upon abstract principles which admit of no infringement, and which are in a sphere too lofty to be tested by experience. So long as they continue to argue after this fashion, we can have nothing to say to them. The argument is altogether above us. If, by infringing some absolute *à priori* rule the truth of which is matter of intuition to these distinguished orators, we can show that we diminish vice and wretchedness, we shall be content to go on infringing it, and all the more willingly because our own intuitions reveal no rule of the kind. We can however only meet our antagonists when they condescend to some lower ground, where their principles and methods of reasoning are within our grasp. Their objection to "recognizing" vice remains utterly unintelligible to us, though we have laboured to understand it; for if you recognize a vice when you place those who practise it under certain restrictions, it seems that not to recognize means not to take any measures against it. There is indeed a certain meaning in the argument which we are rather slow to attribute to our opponents, although we find it vaguely suggested. They tell us that they wish to repeal these Acts in order that they may begin a crusade against prostitution. If they mean by this that they propose to suppress vice by the criminal law, we have a very simple answer. All experience proves that any such measure would be of the most frightfully demoralizing character. We need not go into any arguments in support of this proposition, which indeed is pretty generally admitted. Our reasons are sufficiently obvious, and we may safely leave them to our readers. In fact, we can hardly suppose that these crusaders really mean to suggest any such suicidal policy. But if they do not mean to propose direct legislation against vice, what do they mean? If they propose that purely moral methods of repression are to be adopted, they simply mean that we are to return to the former state of things; or, in other words, they mean, by not recognizing vice, that we are not to subject vicious persons to any penalties whatever. We have no desire to speak slightingly of moral influences; but we must ask why the moral influences should not co-operate with the influences now brought to bear. It is said by the supporters of the Acts that they have done more to diminish disease and raise the general tone of morality than all the voluntary efforts of all philanthropists put together. Whether this be true or not, it is at least evident that under the Acts degraded women are brought within reach of moral influences more systematically than they ever were before. We are not called upon to choose whether women should be superintended by the police or by the clergy; the police bring them within the reach of the clergy; and the Acts, if properly worked, may be, as apparently they are, worked in co-operation with reformatories and their managers. We may therefore fairly call upon objectors to show what they propose to substitute for the present system, and how their crusade is to be carried out. So far as we can judge, they ask us to suppress one reforming agency on the faith of a vague promise that some other will be put in its place. Our faith in such promises is not very strong, and we have a decided impression that the only real alternative to the Acts is letting things alone.

There is indeed one other argument which is plausible at first sight, and which appears to have convinced Mr. Henley. By diminishing disease, he says, you encourage vice. The concession thus tacitly made is enormous, and its value may be easily measured. Suppose there were no disease at the present moment. What would be said to a proposal to introduce a punishment which should strike the guilty in a most capricious manner, which should extend its effect to the innocent, and which should injure the constitutions of the unborn? Would such a punishment really exert a moral influence in any case? Will anybody take upon himself the responsibility of saying that he would introduce one of the most frightful diseases known to humanity in order that an additional motive for virtuous conduct might arise? And yet, if you object to the suppression, you should in consistency propose the introduction of disease. Admit frankly that you prefer to maintain disease, and your argument is certainly intelligible; but it is not likely to win many adherents. In fact, however, we altogether deny the validity of the argument. Vice is a product of certain social and moral conditions, and can be lessened in proportion as they are modified; but the fear of the penalty is shown by experience to be of very little value. It may at times make people cautious, but it does not render them virtuous; and its collateral effects are purely disastrous. The tendency of the disease when widely prevalent is to lower the moral as well as the physical health of the population; it diminishes self-respect, and in the long run produces more recklessness than caution. Some men are frightened; a majority become indifferent and brutalized. It would of course be difficult to prove either view by statistics, which are scarcely obtainable; but if a man is bold enough to say that the disease should be maintained for its moral value, he will have great difficulty in proving that it has any moral value whatever, and still more in showing that the value is sufficient to counterbalance the innumerable collateral evils inflicted upon innocent people. Towards making a population virtuous it is a great step to raise the tone of their physical health; and any encouragement of disease is a policy so doubtful that we should hope it will never afford a basis for legislation. Other diseases may be regarded with equal plausibility as a punishment for dirt and drunkenness; but it would be a very singular mode of legislation to encourage fevers and delirium tremens, or even to avoid stamping them out, as a means of increasing cleanliness and sobriety.

WAITING FOR PRINCE PRETTYMAN.

WHATEVER the strong-minded sisterhood may say, marriage is the great object of most women's lives, their chief thought when they are young, their greatest regret, if missed, when they are old. Almost all women of normal healthy development desire to be wives and mothers, and feel that the best of life has been foregone if fate and circumstance have forbidden it. It is a truism to say that the world would not go on else; and there is no reason to be ashamed of the fact or its avowal. There is more need to be ashamed of its denial, representing as this does the absence of some of the noblest and tenderest qualities of womanhood, which yet have to be kept in hand till the fitting moment has arrived. Negation and control, however, are different things. The question, then, with those who have what the world calls "chances," is not, save in rare exceptional cases, Shall I refuse them all? but, Which shall I take? It is a grave question, as every woman knows who has at the same moment a *bonâ fide* lover of a good kind and a potential hanger-on of a better; and it is a question in which soul and sense, prudence and passion, the lovely dreams of romance and the greatest chance of practical prosaic happiness, seldom unite. Many girls, chiefly family favourites and considered pretty in their circle, in which opinion they themselves concur, but also some who are neither, refuse all sorts of fair-seeming offers out of the pure unreason of youth and for the sake of the dazzling possibilities of the future. They do not know how many golden balls, ever so much bigger and richer than this, may not be thrown at their feet; and they reject the actual and living man who would really make them very happy if they would only think so, waiting for that apocryphal Prince Prettyman who never comes. They are dimly conscious too that when a woman gives herself in marriage she has lost her present form of intoxicating supremacy, though by tact and temper she may gain another of a more sober and durable kind. The courting time is her time of queenhood; and so long as she keeps from uttering that fatal Yes, she is mistress of the situation, as the one who has to decide for the misery or happiness of both, and who can confer a favour and grant a prayer. Naturally she is anxious to prolong her sovereignty, knowing that when she marries she sinks from a queen into a slave, and that the lover who fawned upon her as humbly as a dog becomes her master, more or less severe, as soon as the law makes him her husband. All girls feel this; and those among them who have most of what is called maidenly pride in their intuitive knowledge of what their self-surrender means, half unconsciously, half consciously, prolong that moment of surrender, as any one else would delay any action by which power was lost, though, in a sense, security was gained. This is one reason why girls with chances hesitate, and why they are sometimes so long in making up their minds that the chances pass them by, and leave them stranded for the remainder of their days.

Another reason of their delay is Prince Prettyman. There are women who are always waiting for the coming of the Prince, like the high-born maidens in the palace towers of romance and fairy-land, and who will be content with nothing less than their ideal realized. Nobody is good enough for them; and their friends stare at the infatuation which led them to refuse such suitable, such excellent offers, for no one knows what reason. Smith is one of the aspirants. He is really a very good fellow, with a nice present income, fair prospects, and no hereditary disease that the world knows of. To be sure he is no Rothschild; and his sharp-featured mother, with his tribe of busy maiden sisters and industrious brothers, do not take rank among the idealities of the human race. But, so far as he himself goes, you might find many a worse man, if some better; and Clorinda would not do amiss if she chose him. Clorinda rejects him. She is waiting for Prince Prettyman—Prince Prettyman, who has no sharp-featured old

mother with strict notions about Sundays and chignons, no busy maiden sisters who talk three at a time, and who would consider her house, her maids, and her babies as much theirs as her own, no industrious brothers of all sorts of queer professions, and no amount of "style." Smith's income and prospects and good condition generally are not sufficient for her, penniless as she is. She must have perfection all round—Prince Prettyman, and never a flaw in his circumstances, personal or relative. The consequence of which is that at forty she subsists on charitable contributions from her friends, and music-lessons when she can get pupils. Brown comes to the front, and lays siege to the fair Amanda's heart as Smith had done to Clorinda's. He gratifies her romantic aspirations as little as in the other case. He is as worthy a fellow as ever stepped; and he too has enough and to spare for comfort. He would be a quiet placable kind of husband, who would use his latchkey with discretion, and not make her temper bad by the sourness of his own. He would not philander after pretty women abroad, and he would not rage in the sanctuary at home. He would give her a liberal allowance for pins and housekeeping; and he would take the boys off her hands at holiday time, and be generally willing to save her both trouble and annoyance. But with all these slices of solid pudding he is not Prince Prettyman; consequently he is nowhere in the running. His eyes are small, his nose composes badly in a photograph, his voice is unmelodious, and his hands are uncomfortable about the joints. Nevertheless, small eyes, a mean nose, and uncomfortably articulated hands, united with a good home life and a kind husband, are better than beauty and a bad heart, rapture in the honeymoon and repentance ever after. Yet Amanda, like her sister, refuses honest, homely Brown in favour of the beautiful Prince over the seas; and the chances are so many as to make a certainty that the Prince will never cross those seas at all, and that Amanda too will go husbandless through life because of the tinsel picture which romance had drawn on her young soul, and which there was not enough common sense about her to rub out; or perchance, worse still, she will end with marrying Brown's clerk, who has every disadvantage his master had, and nothing of his compensations.

Prince Prettyman has many impersonations—as many as there are silly girls who wait for him. With some it is absolutely necessary that he should be in the army. The glitter of epaulets and the jingle of spurs are worth any amount of stupid, civilian, workaday virtues, and nothing but a well-set-up cavalry officer can get a hearing from the garrison belles who have learnt but one litany of love. With others a man whose soul is devoted to dogs and horses is the only kind of person who carries Prince Prettyman's credentials. Talk of a well-conditioned City merchant, with a sprinkling of grey hairs and suspicious tracts of shining scalp, or of a rising young professional who could as soon mount a camel as a horse, to those sweet creatures whose fancy paints the gallant hussar or the fast young squire—talk of fidelity, tenderness, truth, and the like, without dash, without personal beauty, without the glittering insignia of Prince Prettyman—and you talk to the deaf. They have their ideal man and their ideal conditions, and nothing short of either will be accepted. A beautiful young painter or poet, with soft eyes and a silvery voice, well up in the religion of art and cultivated to the highest point in æsthetics, is Prince Prettyman to one. This is in all probability the kind which talks of the union of souls and forgets the butcher's bill. It is a way both he and his admirers have; the debasing considerations of filthy lucre chilling the ardour of the soul in a remarkable manner. It is a pity that the tax-gatherer should be so obdurate; and that Prince Prettyman sailing over the silver sea of creative fancy should be brought up every now and then with a round turn to the barren stake of poverty, or grounded on the grating shallows of domestic bills with no effects to meet them. A high-class diplomatic-looking person is the hero of one young maiden, who has ideas; and she will accept no offer, however eligible, if the maker thereof stands below six feet, is rotund in body, and of an indiscriminate kind of social position. So it goes on; Prince Prettyman, whatever his special form, always looming in the horizon, always being waited for, and in the great majority of cases never coming.

It is a complaint as old as man, that we only know how to live when we have done with life. The saying is essentially true of marriage and of the right kind of person to choose. Girls of romantic tendencies think they ought not to marry unless with the most passionate *furore* of love. They do not know that respect and compatibility of temper are better sureties for a happy life than a passion which must in time wear itself out, however strong it may be now, and of which the best hope is that it may become friendship. Good plain common-sense men, who would make excellent husbands but are nothing to look at, are refused by certain of the feather-headed, in favour of a dream that will never be realized, a fancy that has no more substance than a soap-bubble. Or personal worth is refused for mere wealth, quite as often as for penniless romance. The man of a girl's fancy is too handsome to be a traitor, a *roué*, weak, or of so wayward a temper that her life, if she marries him, will be simply a torture. She is sure of him, she says with indignation when stony-hearted wisdom points out his patent flaws, and experience preaches caution and renunciation. She knows that love will not fly out of her window when poverty stalks in at the door; or she does not believe he is a *roué* now, whatever the evidence. And even if he is, she comforts herself with the sensible reflection that a reformed rake makes notoriously the best husband; and no woman is proof against the seduction of reforming the man she loves, and bringing him to virtue by means of her wiles. She is in love, and she believes that her love is eternal. Pretty girls of poor circumstances and belonging to large families, whom it would be an incalculable relief to get well settled, have been known to refuse eligible offers from good men because of this fancy of theirs about Prince Prettyman. Of course one would not like to see women give themselves to any one, no matter who he might be, for the sake of getting married; but the solid things of life should be taught them as well as its poetic beauties; and false hopes, false ideals, unsubstantial loves, should be rigorously excluded. A bad marriage or a loveless life is not a pleasant *coda* to that never-acted romance; nor is the disenchantment which comes with such cruel certainty on the heels of the love-sick and unsuitable marriage a blessing to be desired. Beauty fades, passion cools, the blindness of romance gets couched when seeing is too late; poetry does not pay the butcher; and gallantry of bearing of the "long sword, saddle, bridle" kind is apt to lose itself in domestic bad language when the pot is empty of pudding and half-a-dozen children swarm about the musty lodgings or dingy quarters to which love and folly have reduced the gay lieutenant and his bride. On the whole, Prince Prettyman is a dangerous fellow either to get or to wait for, having the trick of unsubstantiality throughout. Romantic girls would do well to reflect that, if they are to have only one gown in a lifetime, they had better buy one that will wash and wear creditably to the end, rather than a flimsy bit of finery that looks well only in the beginning, and goes to pieces before the first year is out.

MERCHANTS AND LAWYERS.

THERE appears to be an impression among mercantile men that they are very much sat upon and oppressed by the lawyers, and that it would be a great relief if they could only get rid of the law courts and settle their disputes among themselves. At a meeting which was held at the Guildhall on Tuesday some very strong views were expressed on this subject. Mr. Lyne, who moved the first resolution, said it was necessary that the mercantile community should get rid of lawyers, as their power was such as to demoralize the country. In his opinion the power of the lawyers was a refuge for the greatest roguery. Mr. Lyne's language was rather too violent for his audience, and he was called to order. But other speakers said pretty much the same thing in other words. It was asserted that there was really no necessity for the employment of lawyers at all, and one gentleman observed, amid general applause, that the most imprudent step a man could take was into an attorney's office. Mr. Alderman Cotton, who presided, described in a pathetic manner the discomfort, worrying of mind, and sleepless nights he had experienced from engaging in a law-suit. The object of the meeting was to pass resolutions in favour of what are called Tribunals of Commerce, and Mr. Alderman Cotton thought that if these tribunals could only be got up in England there would be an end to all worrying of mind and sleeplessness on the part of suitors. In his opinion the advantage of Tribunals of Commerce is that they may be trusted to decide cases "on the facts," whereas the law courts have an inveterate habit, which the worthy Alderman appears to regard as highly objectionable, of deciding cases, as he puts it, "according to law." The result is that "probably an injustice is done." It might be suggested in extenuation of the law courts that it is supposed to be their mission to administer law, but the Alderman would perhaps reply that this is only another way of describing their injurious functions. We gather that the object of Tribunals of Commerce is to put an end to law as well as to lawyers. The idea seems to be that law is a purely artificial luxury, and serves no purpose except to enrich those who manufacture and vend it. With a great deal that was said at the meeting it is impossible not to agree. It is undoubtedly a highly imprudent and sometimes a ruinous step to go unnecessarily into an attorney's office, and it may be taken as a safe general rule that it is well to avoid attorneys as much as possible except for the purpose of learning from them how to keep clear of going to law. It is unnecessary to assume that a consultation with a lawyer is invariably a prelude to litigation; but there can be no doubt that litigation is little short of a calamity for those who engage in it. It is troublesome, costly, and uncertain. There is always a risk of an adverse decision even in what seems the plainest case; and if a verdict is gained it seldom repays the victor, we will not say for his anxiety, vexation, and loss of time, but even for the actual money out of pocket in law expenses. All this may be admitted, but the mistake is to assume that it is the fault of the law. Mr. Alderman Cotton and his friends will perhaps hardly believe us when we say that it is usually the facts, and not the law, that occasion the main burden of law expenses. The rules of law are comparatively simple, and easily ascertained; the difficulty is to ascertain what is the precise state of the facts to which they are to be applied. When there is no dispute about the facts, the legal questions involved are generally soon settled. The mercantile gentlemen who are to sit upon these Tribunals of Commerce might no doubt be trusted to do their best to keep clear of law; but the object for which the Tribunals are to be established would not be accomplished unless they shut out the facts as well as the law. A law-suit, as presented in court, usually supplies a very imperfect measure of the amount of work bestowed on its preparation. The facts have to be sifted from

the beginning; evidence has to be fished up and examined, perhaps with no other result than to show that it is irrelevant or insufficient; and much of the evidence actually held in readiness to be produced is provided only in case it should be wanted, and is often not made use of at all. What is exhibited in court is only the cream of a long and laborious investigation. The costs of litigation are chiefly incurred, not in court, but in preparing to go into court; and it is difficult to see how even Tribunals of Commerce could prevent suitors from making such preparations as they might think necessary for the purpose of proving a case. Of course a Tribunal of Commerce might take upon itself to refuse to hear evidence, or to limit it to the statements of the plaintiff and defendant; but it is doubtful whether decisions on the facts arrived at in this manner would afford unqualified satisfaction; and, short of this, one of the principal sources of law costs would remain as fertile as at present.

We have no doubt that the fallacies expressed at this meeting have a wide currency, and it is therefore worth while to expose them. It should never be forgotten that the object of having law courts is not merely to decide questions in dispute, but to prevent disputes from arising. It is necessary therefore that decisions should be given in such a way as to afford rules for future guidance. This is the snare of what is called substantial justice. A weak or foolish judge tries to adapt broad principles of law to the merits of a particular case. A poor man has been wronged, and the judge trims the law to procure him redress. The good which is done in a single case by a proceeding of this kind is infinitesimal compared with the mischief of weakening or confusing the rule of law which has been tampered with for the purpose. *Fiat jus, ruat justitia*, Mr. Justice Maule used to say, and this version of the familiar maxim undoubtedly contains a great truth. The notion of the people who are calling out for Tribunals of Commerce would seem to be that suitors should just walk into court, state their differences, and receive an off-hand decision. This is the sort of justice which is administered in Eastern countries by the Kadi sitting at the gate, but it is perhaps hardly suited for transplantation into a civilized country. It is singular that even an Alderman should not see that to ask for a decision without law is simply to ask for an arbitrary decision for which no reasons are or can be given. Directly you get to reasons you get to law. The law is only the reason of a decision. Practically of course it is impossible to have courts without law—that is, rules and precedents—and if you have law you must have lawyers; that is to say, persons who have mastered the rules and precedents, and who are willing to lend or sell their knowledge and experience. Mercantile cases frequently turn on questions as to the usages of a particular trade or market, and men of business engaged in the trade or frequenting the market would no doubt be capable of stating authoritatively what the usage in question really amounts to. But it does not follow that they are capable of giving a sound judgment on the facts of the case. There is a science of evidence, and it must be studied like any other science. It implies a peculiar discipline of the mind which is probably not very common in commercial circles. Even supposing that men of business were competent to try these cases, would the public be ready to assume that they were perfectly impartial and unprejudiced? Would not the composition of a court which gave a decision be jealously scanned to see whether it contained a majority of wholesale or retail dealers, or whether in a dispute between different trades the balance of the Bench was on one side or the other? Of course, we are not raising any question as to the personal honour of mercantile men; but, after all, they are only men, and, human nature being what it is, it is on the whole probable that their decisions might not command implicit confidence. The judges would be constantly mixed up in transactions of the very kind on which they would have to adjudicate, and with the people who would come before them as suitors; and there would evidently be a tendency to suspect a bias on the side of personal interest or connexions. There may no doubt be something to be said for extending the limits of the County Courts so as to enable them to deal with a wider range of mercantile cases, and also for providing judges in such cases with the assistance of practical experts as assessors on questions of trade usage. But that is a very different thing from setting up bankers and merchants to dispense arbitrary justice from the bench. There is another aspect of the matter which must not be overlooked, and that is the influence of the Bench on the Bar. A body of amateur judges, ignorant of law, and unskilled in judicial investigations, could hardly be expected to keep the lawyers who practised before them in order, and the license of the Bar would be in proportion to the weakness of the Bench.

One of the speakers at the meeting in the Guildhall remarked that a dispute which had lately arisen between himself and an agent respecting goods to the value of 5,000*l* or 6,000*l*. was quickly settled at Hamburg at an expense of some 60*l*. or 70*l*. If the case had been tried in England, it would, he believed, have gone on for about ten years, and have consumed the whole sum in dispute. We do not know what was the nature of the case, and it is obvious that the amount of money involved affords no measure of the difficulty of arriving at a decision. The question may have been a very simple one, which any court could deal with offhand; but it is of course absurd to talk of mercantile cases going on for ten years in this country. Another gentleman complained that a suit in which he was engaged cost him 500*l*., although it was settled before the parties went into court; but there is nothing wonderful in this, as the parties had to be prepared for the contest in court, and it is these preparations which swell the sum of law expenses. It is impossible to lay down a rule that the expenses of a suit shall never be more than a certain proportion of the money in dispute, simply because the expenses depend, not on the sum at issue, but on the intricacy and difficulty of the questions to be determined. Besides, it is perfectly well known that law expenses always greatly exceed the taxed costs of the courts. It is impossible to place any restriction on the expenses which parties may choose to incur for the purpose of procuring evidence in their favour. The reason why litigation in the County Courts is comparatively cheap is simply because the questions which are usually taken there are of a very simple character. It is possible, as we have said, that arrangements might be made for the more summary trial of mercantile cases; but the mere substitution of merchants for lawyers on the bench would certainly not tend in itself either to cheapen or facilitate litigation. The experience of the Continent on this subject is not of much value as regards England. English men of business are, as a rule, not prone to litigation. They do not think it worth while to cry over spilt milk, and generally try to settle disputes by private compromise. But when they do go to law they like to fight out the question, and spare no expense in trying to obtain a verdict; and it may be doubted whether they would be content with a hasty decision thrown off after a superficial examination of the matters in dispute. If mercantile men are anxious to settle their own quarrels among themselves, let them do so. They have only to come to an agreement to that effect, and to make arrangements to refer all differences to arbitration by men of their own class. Other classes of the community may reasonably object to be placed at the mercy of courts composed of traders who would have their own interests to serve. We cannot help thinking that men of business who are anxious to keep clear of lawyers and to avoid legal expenses cannot do better than devote their attention to the best means of avoiding disputes in the first instance. This subject has been investigated by a Committee of the House of Commons, and it was shown that disputes arise in many trades in consequence of the undue haste and carelessness with which bargains are made. If traders would only take the trouble to make a written note of their bargains, the risk of subsequent differences would be greatly reduced. It is somewhat surprising to find merchants of position in the City sharing the vulgar delusion that law is a pure invention of the lawyers, and kept up only for their private interests. The usages of trade, as to which it would be the business of the Tribunals of Commerce to give decisions, are themselves only a branch of law. Law is nothing more than the established rules of intercourse and dealing between men, and these are to be found in one form or another in every sphere of life.

THE LAST FULDA PASTORAL.

WE cannot presume to claim any part in that prophetic gift which enabled the *Times* on Tuesday last to explain in considerable detail what "may be said *to have been*" the policy of Pius IX., "from his return to Rome (from Gaeta) *up to the day of his death*." Not indeed that the writer exactly professed to be predicting, for his account of the matter was throughout expressed—like some of the most famous prophecies on record—in an historical form. To his prescient gaze the Pope, notwithstanding some telegrams in a different sense to be found in another column, was already dead. If His Holiness shares that craving to hear the verdict of posterity which has before now led some eminent persons to spread reports of their own decease, he must have been gratified by the opportunity thus kindly offered of studying his own obituary. That his death, whenever it does occur, may materially affect the *status quo* throughout the Roman Catholic Church is probable enough. Meanwhile we must be content, in the absence of any special information about the future, to take things as they are. And certainly, from whatever point of view we look at it, the pending ecclesiastical contest in Germany bids fair to assume serious proportions, though it is impossible as yet to forecast the ultimate issues. The Emperor is reported, when closing the Prussian Diet, to have expressed a comfortable conviction, which speaks much for his sanguine temperament, that the new Church laws "will promote concord among the various confessions, and lead the Church to devote its strength to the pure service of God's Word." The Church, as represented by its rulers, will not perhaps be slow to rejoin, and with some plausibility, that similar professions of disinterested zeal for its spiritual efficiency have been common with those who were eager to relieve it of temporal privileges and emoluments. There is of course another side to the picture. We never doubted, and feel still less inclined to doubt after reading their last pastoral effusion, that the Prussian bishops have chiefly themselves to thank for what is occurring now. If they had not been so ready to embrace the new doctrines which they had a few months before only too successfully confuted, the Government, as Prince Bismarck has repeatedly explained, would have been more than willing to leave them unmolested. We are not defending his policy, but it is obvious that, when once the Vatican decrees were accepted, the relations of Church and State were placed on a new basis. Cardinal Cullen did indeed maintain the other day, as witness in the O'Keeffe trial, that the Pope had always enjoyed

direct and ordinary jurisdiction over every diocese of the Catholic Church, and that "from the days of the Apostles" no good Catholic had ever questioned it. But even he was obliged under cross-examination, to qualify this astounding statement by a distinct admission that this immediate and ordinary jurisdiction was first made into an article of faith by the Vatican Council. And that makes all the difference. It is no secret that the successful resistance of the late Archbishop of Paris to this very claim of the Holy See some years ago was a main reason for investing it with dogmatic sanction. An abstract opinion about the legitimate range of Papal prerogative, though held by what has long been the dominant theological school in the Church, is not a matter about which the lay world is very likely to trouble itself, any more than it troubles itself now with the opinion, also generally maintained by Ultramontane divines, that the Pope has *de jure* temporal dominion over the whole earth, though he generously forbears to claim it. But an opinion of this kind, when it is formally proclaimed as a dogma, is sure to be translated into practice. The German bishops as well as the Irish Cardinal are acting upon it at this moment. And their conduct explains, though we do not say it justifies, the attitude of the State towards them. They have just issued "from the grave of St. Boniface at Fulda" another of those periodical appeals to the clergy and the faithful which are evidently felt on all sides to be among their most effective weapons for carrying on the contest. And the Liberal papers have in some degree recognized the importance, not of its contents, but of its possible effects, by the elaborate comments they have made upon it.

The document itself, supposed to be from Bishop Ketteler's pen, is neither a profound nor an interesting composition, but it is skilfully adapted to its purpose and to the audience to which it is addressed. The bishops begin by reminding their beloved in the Lord of the grievous condition in which the Church everywhere finds herself, and especially in their own fatherland. A series of laws directed against "the divinely ordained constitution of the Church," dividing the bishops from their supreme head, and the clergy and people from their lawful bishops, has been passed in spite of episcopal protests, and of the manifold addresses and deputations, most consoling to the hearts of the bishops, which attest the deep sympathy of their clergy and flocks with them in this season of trial, and their resolve to remain firmly attached to the holy Father, the pastor and teacher of all Christians, and to their lawful bishops. On this last clause it has been observed that the lay addresses of sympathy have been but few, while even the clerical addresses, which are made to order, and therefore carry little moral weight, have been far from universal; and various instances are quoted of clergymen either signing, under constraint, "with a smile or a sigh," or suffering for their refusal to sign. The bishops add, that for their part they shall always adhere to the principles of Christianity and eternal justice, whatever the laws may say, and exhort their clergy and people to remember that he only is a legitimate bishop who is appointed by the Apostolic See, "the fountain of ecclesiastical unity and power," while all others are intruders, and are *ipso facto* excommunicate—a prospective blow aimed at the Old Catholic bishop to be shortly elected. "In accordance with the constant usage of the Church," the bishops remit all doubtful questions to the decision of the supreme pastor, though they will not fail to observe all their duties towards the civil power; how the two lines of duty are to be reconciled is not explained. Finally, they point out that the Church has never been in such perilous plight since the conversion of Constantine brought her three hundred years of persecution to a close, "public life, the press, literature, science, and education" being united in an unchristian conspiracy against her; and they commend the future to the fervent intercessions of the faithful. A flaming epistle, addressed a few days later by Cardinal Rauscher, one of the leaders of the Opposition at Rome, to Bishop Lachat of Basle, enclosing a present of three thousand francs, is not unnaturally regarded by the Austrian and German newspapers as a sort of supplement to this Fulda pastoral. The Cardinal compliments his correspondent on showing himself a model and bright example to all bishops and priests who are oppressed by the strong arm of the State, denounces in no measured terms "the enemies of justice and truth," and trusts that the Church will emerge with renovated vigour from her present heavy trials. This is little more, of course, than sounding verbiage; but then in Austria the struggle is not imminent at this moment. It is no affair of words in Prussia. Since Dr. Falk's Bills received the Royal sanction, the Ministry of Worship has been engaged in making provision for carrying them out; and already the new Examining Board and Ecclesiastical Court—the former composed of high officers of State and professors, the latter of judges and Government officials—are in course of formation. And the Redemptorists and Lazarists are to be expelled as well as the Jesuits. Why the Lazarists are included it is difficult to understand. The Redemptorist Order was, no doubt, studiously organized by its founder, Liguori, on the Jesuit model, and breathes the spirit of the more powerful Society, in whose track it has ever been content to follow at a humble distance. There is probably as much or as little reason for banishing the one as the other.

We have already more than once observed that these sweeping measures are of doubtful expediency, and hardly less questionable justice. And we are not, therefore, at all surprised to find a zealous champion of Prince Bismarck's policy putting aside his favourite thesis, "that he is not at war with the Catholic Church, but with a party in it hostile to the State," as at least inconsistent with a *prima facie* view of the situation. There does indisputably exist a great divergence of opinion among the Catholic clergy and laity, and perhaps even among the bishops, on some of the points at issue; but "the official Church," as the critic in the *Allgemeine Zeitung* phrases it, the Church as represented by the hierarchy, has spoken throughout the controversy with no uncertain voice. It is quite true that "a tale of little meaning" may be put into very "strong words," and a pastoral of the present Prince Bishop of Breslau has been quoted, written twenty years ago—at a time when the civil and spiritual authorities in Germany were on the best terms—in which he is to the full as eloquent as he and his episcopal brethren have lately shown themselves on the persecutions, oppressions, and dangers of the Church. Still it would not be safe to infer that the bishops mean nothing now, and it seems that a considerable section of the Protestant pastors, who are alarmed at the increased influence likely to accrue to the laity under the new *régime*, are disposed to side with them; not that this alliance is likely to be of much practical service to the cause. It is more important to reflect that, however vigorously the new laws may be put into execution, it is one thing to bring a horse to the water and another to make him drink. A parish priest, for instance, who is under episcopal censure may be maintained in his office and benefices by the State, but unless his people are with him, as in Father O'Keeffe's case, his position would soon become morally untenable. And it is on this account that the German bishops are so anxious, by means of direct instruction in church and school, by glowing pastorals, and through the various appliances which a strongly organized hierarchy is sure to have at its command, to educate their party, so to speak, in correct views of the nature and extent of spiritual rights and duties. The strong arm of the law, even when backed up by a copious and powerful press, is no match for the spiritual forces arrayed against it; and the Liberal press itself, by the confession of its own organs, is too unmethodical, divided, and purely negative in its utterances to counteract the clear and systematic teaching of its Ultramontane rivals. It is accordingly suggested that an energetic and organized scheme should be set on foot to meet Jesuit and other kindred influences in the only way that can be really effective, and conduce to the "internal harmony of the Empire and people," which the Emperor seems to anticipate from the action of the new laws, by securing their thorough cultivation and instruction in the true principles of Christianity. We have nothing to say against the suggestion. Mr. Froude argued the other day at the Literary Fund Dinner that the press now discharges functions formerly exercised by the Roman Catholic Church, and its importance as an engine of religious influence was pointedly insisted on at the last Old Catholic Congress. But we cannot help thinking that this friendly suggestion of the Liberal press would have come with a better grace and more auspicious promise before the new ecclesiastical legislation had made all such overtures from the same quarter so peculiarly unpalatable to those for whose benefit they are designed. The most cogent arguments are apt to lose their persuasive force when you have knocked down your antagonist, in the interests of truth, before undertaking to convince him of his errors.

RAILWAY ACCIDENTS.

THE attention of the House of Commons having been called, pursuant to notice, to railway accidents, that House, after the delivery of five speeches, was counted out. We wish that the management of railways were as satisfactory as the collapse of the proposed debate upon it would indicate; but although much has been done for the safety of passengers, much remains to do. The Companies represent that they are making great exertions to extend the block and interlocking systems on their lines, and a Committee of the House of Lords, which lately inquired into this subject, has recommended that time should be allowed to the Companies for voluntary action, and that a Bill which proposed compulsion should not be carried further in the present Session. If the House of Lords is rightly advised by its Committee, the House of Commons is not called upon to act at present, and in that case it might perhaps do well to abstain from talking. It is not desirable that the attention of the House of Commons should be called to the loss of life on railways at a moment when it is probable that attention will not be given.

The Committee of the House of Lords report that there was a general concurrence of opinion among the witnesses who were called before them in favour of the block system on all important railways which carry passengers, and that experience has proved that this system is compatible with the highest rates of speed. The witnesses also concurred in recommending the interlocking system on lines where there are numerous junctions and frequent trains. It has, indeed, been argued on the other side that these precautionary arrangements and mechanical appliances tend to lessen the sense of responsibility in the engine-drivers, but nevertheless the advantages resulting from the introduction of these systems were practically admitted by all the witnesses, and, in the judgment of the Committee, decidedly preponderated. It may be interesting, however, to observe what has been urged on high authority against mechanical appliances. Mr. T. E. Harrison, Engineer-in-Chief to the North-Eastern Railway Company, says that in the earlier times within his recollection such a thing as a signal was not known. As in progress of time signals were

put up to protect the line, he found that there was a wasting away of that forethought and look-out which the men had before exercised. "If you have protection by signals, you take away from the diligence of the men." This witness had recommended the block system to his Directors, but originally he had very great doubts about it, for the reason already stated. Mr. J. Grierson, General Manager of the Great Western Railway Company, says that the introduction of the block system tends to remove the sense of responsibility from the engine-drivers. "They are not now all as careful as they used to be, and we have had as many accidents, I might almost say, within the last few years arising from that cause as we had without the block." This effect on the engine-drivers is "a very great deduction indeed" from the advantage of this system. Captain Tyler, on the other hand, says that the tendency which he admits towards negligence is got over by a little more discipline, and he does not think that, in a general way, there has been any very serious inconvenience on this account. The drivers and guards of trains ought to know nothing about the security of the block system, but act as if there were none at all; but, nevertheless, there have been cases where the drivers have not kept so good a look-out as otherwise they might have done in front, and the guards have not been so active in running back to protect a train when they believed they were under the block system. "A little more discipline is required in that respect." There is a point, however, at which the necessity for the protection of passengers by the block system becomes so clear that argument as to its effect upon the minds of drivers and guards is futile. The Metropolitan Railway was started on the block system, and it would be impossible to work trains at intervals of two minutes without it. This Company has a larger proportion of break-power in proportion to the length of a train than other Companies. It would be hardly possible to work the block system so close together without extra break-power. The manager would not undertake the responsibility of working the traffic unless he had both the blocking and interlocking systems as perfect as possible. At the busiest period of the day he has in and out of Moorgate Street thirty-two trains in an hour. "We have some of the most difficult junctions in the world. We have junctions in the dark, in tunnels, on falling gradients, and on sharp curves," but they are all so thoroughly signalled and so well blocked that only by the driver's neglect can accident occur. On the London and North-Western line there are 323 miles under the block system, and 299 miles are nearly finished, and will be shortly in operation. The whole of the line from London to Carlisle will soon be under the block system. The accident at Abergele would have been prevented by this system. The General Manager of this line has no doubt that the block system tends to reduce the number of accidents from collision, but it will never entirely prevent such accidents. "We must be dependent on the men who carry it out, and they are of course liable to mistakes. We have had accidents under the block system on our line." On the Midland Railway the block system is in operation over 447 miles. The General Manager finds considerable advantage in this system where the line is crowded. "We have always been in favour of the block system on our main line, and from time to time it has been ordered where the traffic has become crowded or sufficient to justify the introduction of so costly a system." But the great main lines of railway require and can afford precautions which would be inapplicable to small branches. Even the Inspectors of the Board of Trade say that where there is a single line, and the traffic on it can be worked by one engine in steam, there is no necessity for the block system. Collisions cannot take place, for there would be no other train to run into. All, or almost all, possible great lines have already been made in England; but there is room for innumerable small lines, if they could be made at cost low enough to pay. Hence, for this class of lines we are likely to approach the American system, where there are no gates at crossings, no fences, and hardly any distance signals, and the safety of the train depends upon the driver. "The men know that they must keep a good look-out, and they have few accidents." An experienced observer from whom we quote these words, says that he remembers the time when there were no distance signals in England, and accidents were not more numerous then than they are now. The great bulk of American accidents occur from the falling of materials; their rails and bridges are very lightly built. The speed on most of the American lines does not exceed thirty miles an hour. The same cause explains, as many of us know, the freedom of German lines from accidents. Trains proceed slowly and at rare intervals, and in South Germany it almost seems as if beer-drinking at the stations were the principal business, and travelling a mere accessory of the railways.

The block system is so simple as to be readily intelligible. Let there be two stations, A and B. If a train has passed A, no other train is allowed to pass A until the signalman at B telegraphs to A that the line is clear. It is said that under this system the driver after passing A takes for granted that the line is clear to B, and keeps no good look out ahead, as he would do if he had nothing but his own vigilance to depend upon. It is easy to put cases where mischief might occur. Suppose, for instance, that a train is proceeding down from A to B, and that all is clear on the down line. An up train might break down after passing B, and some of its carriages might be thrown on the down line, and the driver of the down train might rush heedlessly into the mischief thus prepared for him. A witness told the Committee that formerly he never rode on an engine without keeping a good look-out, knowing that he might run into a train; but under the block system he should never think of doing that. This undoubtedly is human nature which the Inspectors of the Board of Trade say may be corrected by drilling. An instance actually occurred of the engine of a coal-train being short of water, and the driver detached it, and went ahead for a supply, leaving the train standing between A and B. The signalman at B, seeing an engine pass his box, concluded that this was all that he had to expect from A, and telegraphed to A that the line was clear. Hereupon a passenger-train was allowed to pass A, and it ran into the stationary coal-train. There is a station in the North of England which stands at the summit of a continuous ascent of twenty-one miles on either side. A truck let loose either way down this incline would run twenty-one miles without stopping, and the block system would be no security against collision between this descending truck and an ascending train. There seems to be truth in the remark that, although collisions are likely to be rare under the block system, yet when they occur they will be disastrous. The interlocking system is essential to the working of the busy passenger stations in and near London, but we can understand that it would be useless and troublesome in a network of mining sidings in the North of England. To understand this system, suppose a train proceeding from Hammersmith to Baker Street. At Westbourne Park it is on the south side of the main line of the Great Western Railway, and when it arrives at Bishop's Road, Paddington, it is upon the north side. It must therefore have crossed the main line; and in order that this may be done safely the interlocking system must be applied. The train from Hammersmith waits of course for a signal before attempting to cross the down main line. The signalman adjusts the points for crossing, and then adjusts the signal; and as he does this he, by the same act, adjusts the points of the down main line, so that if a train came from Paddington, it would be turned into the down line to Hammersmith. The points and signals are so "interlocked," that one of these operations cannot be performed without the other. The complete safety of such a junction depends of course upon the block as well as the interlocking system; but the two systems are better understood when considered separately. The interlocking system enables two men to do certainly work that would otherwise require ten or twelve men to do uncertainly. A witness stated that during the busiest time in the morning, thirty-three trains passed in and out of the Cannon Street Station in thirty minutes. It is impossible to suppose that that could have been done under the old system. The value of these precautions will be well seen in dealing with the enormous passenger traffic to and from Epsom and Ascot during the races. If we remember rightly, an accident occurred a few years ago on the return from Ascot, which might have been avoided by the block system. The opponents of the interlocking system produce a case where a signalman, having presence of mind, did something to avert a collision which he could not have done if he had had this system to control him. But Captain Tyler produces another case where a signalman similarly situated did nothing except dance about his box crying "I have got a collision, I have got a collision!" Every year produces some striking examples among railway servants of courage and readiness of resource, and also of the absence of these qualities. It may well be that these qualities were more exercised under the old system, just as sailors of the Royal Navy became more skilful seamen before the age of steam. But we could not on this consideration decline to use steam in our fleet. Another matter which must engage the attention of railway engineers is the increase of break-power. That which is done upon the Metropolitan Railway might be done, it is thought, upon other lines. But Parliament is likely to be shy of hasty compulsory legislation. Much must be left to the discretion either of the Railway Companies or of the Board of Trade. Progress is being made in the direction of increased safety of passengers, although perhaps more slowly than could be wished.

THE *NEW MAGDALEN*.

THE progress of Mr. Wilkie Collins as a writer for the stage is not encouraging. The *Woman in White* was an undeniable success, but *Man and Wife* can only be applauded with qualifications, and a new piece which might be called the "Woman in Black" has the unfortunate effect of exciting laughter where the author intends to be solemnly impressive. The *New Magdalen*, which has been produced at the Olympic Theatre, could only be made tolerable by the best acting, and the best acting would be wasted upon such a poor play. Modern warfare can with difficulty be dramatized in any style except that which used to prevail at Astley's, and we incline to think that surgeons, sisters of mercy, and clergymen had better not be dramatized at all.

According to usage there is a prologue to this play, of which the scene is laid in a cottage on the French and German frontier. A French captain and a French surgeon hold a little preliminary talk as to the disposal of wounded men, and then they go out and two young Englishwomen enter. These are Mercy Merrick, "the Magdalen of modern times," and Grace Roseberry, who has lately lost her father in Italy, and is travelling to England to place herself under the care of a friend of her family, Lady Janet Roy. We are to understand that the cottage forms part of a French position which the Germans have attacked once

and are about to attack again with overwhelming force. The "New Magdalen" finds the time and place convenient to recount to her companion the story of her life. She has struggled and fallen; has repented and striven to live well; but on emerging from a Refuge to which she had gone she finds that society will not have her. It is the female version of the *Ticket-of-Leave Man*, but less true than that popular drama to the facts of actual life. The truth is, that a young and pretty or clever woman, who really wishes to cease from immorality, may usually find a husband. There are men who either have no female relations, or do not care for their opinion, and who prefer beauty or other charms to character. It may be inferred from cases which everybody knows that other cases of the same kind exist. Indeed, if a man could get over a feeling which to many men is insuperable, he might obtain a wife whom many other men would admire. When we see Mercy Merrick personated by Miss Ada Cavendish, neatly dressed in black gown and white apron, with the red cross upon her arm, we are lamentably sceptical as to the irremediable wretchedness of her condition. By her own showing she has had two places since she left the Refuge, and in the first a doctor fell in love with her, and in the second her master's intended wife was jealous of her. She does in truth find a husband before the play is over, and we have only to remark that that result might have been obtained without creating a clergyman of the highest talent and character, but some eccentricity of views and taste, for the purpose of marrying him to the lady. This clergyman has preached at the Refuge a sermon from the text "There is joy in Heaven," &c., which has made a deep impression upon Mercy. Her story excites little sympathy from her companion Grace, who is a young lady of correct principles and conduct. As soon as it is finished the battle outside begins. Mercy stands, expecting with superb calm a bullet which shall send her to partake the joys of Heaven, while Grace is distracted with fear of being removed from the joys of earth. A bullet wounds Grace on the head. A French surgeon enters, pronounces that she is dead, and leaves her propped up in a becoming attitude against a bed. Luckily the place is evacuated by the French, and a German surgeon enters, and declares that he thinks nothing of the French surgeons, and proceeds to bring the supposed dead woman back to life. Meanwhile Mercy has determined to assume the name and take possession of the papers of Grace, and thus to make herself an honest woman by a fraud. She is promised a pass to England by a gentleman who explains that he is a Correspondent of one of the great English newspapers, and that he is about to exercise in her behalf a power to which Emperors yield obedience, "the power of the press." Jupiter, as poets tell us, fell in love several times, and Jupiter's deputy is capable of the same weakness as his master. He falls in love with Mercy at first sight. However, he does his best to maintain the dignity of his character by speaking in the slow and solemn tone which Mr. Irving uses to do his "spooning" in *Eugene Aram*. The power of the press makes itself felt in the German army. The words "Pass the English lady" are heard without the cottage after Mercy's exit, while the German doctor places Grace upon a bed, and proves, by help of a looking-glass, that she still breathes.

The first act of the play shows us Mercy under the name of Grace established in the household of Lady Janet Roy, and receiving the attentions of Mr. Horace Holmcroft, lately Correspondent of one of the great English newspapers with the German army. Readers of the novels of Mr. Wilkie Collins will be prepared for the appearance in a hovering ghostly fashion of the resuscitated Grace, who, when she claims her name and rights, is treated as insane. Lady Janet explains to Horace that the war might have been stopped if the newspapers could have agreed among themselves not to report the battles. She mentions that Julian Gray, the preacher whom Mercy had heard at the Refuge, is her nephew, and is expected to make a visit to her house. This news alarms Mercy, who fears that the preacher's penetrating eye will read the secret which she dares not confide to her lover. It is impossible for author or actor to realize the expectation which is raised by the description of the talents and virtues of Julian Gray. Clergymen of the Church of England who desire to see a stage conception of themselves ought to visit the Olympic Theatre. Julian Gray despises preferment, whistles opera tunes, holds radical and socialist opinions, is active, zealous, pious, eloquent, and falls violently in love with Mercy, who has worshipped him ever since she heard his sermon in the Refuge. This exemplary clergyman sits upon a stool and holds a skein of silk for Mercy to wind, remarking that "curates are privileged to make themselves useful to young ladies;" and unfortunately the position and the speech have a tendency to excite the laughter of irreverent spectators, which is hardly appeased when he proceeds to recite a little extract from a sermon. His influence over Mercy leads to her confession of the fraud she has practised, even when she appears triumphant over Grace. Honesty in this instance is certainly the best policy, for she loses a bad husband in Horace Holmcroft, and finds a good husband in Julian Gray. But if a clergyman of the highest reputation yields to the fascination of her beauty, it can hardly be expected that ordinary laymen would be more fastidious. Thus we come back to the point from which we started, that a young and beautiful sinner need not find repentance and amendment difficult. The real obstacle to reformation in such cases is probably reluctance to exchange the admiration of many men for the society of one. The sinner Mercy is more agreeable as well as prettier than the just person Grace, and one begins at last to wish that Grace could be shut up in an asylum, merely to put an end to her annoying practice of hovering among the plants of Lady Janet Roy's conservatory. Mr. Wilkie Collins, as we all know, is nothing when he is not didactic; and perhaps with a little encouragement he might be brought to introduce a clergyman regularly into his plays. If any reader desires to know whether Julian Gray belongs to High, Low, or Broad Church, we can only answer that information on this point may be obtained, or at least applied for, at the Olympic Theatre. Such a piece as we have described would be difficult for any company to act, and, except by Miss Ada Cavendish herself, an arduous task is performed with no particular ability. A few specimens of good old stage sentimentality are applauded in the good old style, but the audience is perversely inclined to laugh where solemnity would be desired by the author. The meetings between Mercy and Grace culminate in something very like a scolding match, and Mr. Horace Holmcroft, the embodiment of the power of the press, is an exceedingly poor creature. But in the scarcity of amusing pieces at our theatres, the serious parts of this play may be recommended as possibly capable of raising a laugh.

The curtain falls, and we are left to speculate as to the thoughts of the Bishop of Julian's diocese, who objected to his whistling, upon his marriage with Mercy. It is to be wished, rather than hoped, that the Bishop might be able to partake in the rejoicings of the angels over rehabilitated character. But the novel on the same subject goes beyond the wedding-day, and explains how the fashionable friends of Lady Janet Roy cut her nephew's wife and obliged the newly-married pair to emigrate. There are degrees of improbability, and perhaps Julian Gray could have fallen so much in love with a repentant sinner as to marry her, and yet not so much as to be able to renounce for her sake fashionable society. *All for Love, or the World Well Lost*, was, we believe, the title of some play on the subject of Antony and Cleopatra. But the modern Antony is able to reckon his love for his Cleopatra, and finds that it just stops short of enabling him to endure banishment from ball-rooms. It is possible that Mr. Wilkie Collins is not well acquainted with the habits of the clergy, and he may not be sensible of the grotesque features of the picture which he draws. Such a woman as his Magdalen could find a husband if she were not too particular in choosing one, but she would scarcely find him among the clergy. But suppose a clergyman with the zeal and eloquence of Julian meditating such a marriage, he would hardly be deterred from it, after getting over other obstacles, including his bishop, by the thought that it might not be pleasant to take his wife to his aunt's balls. We may remark, by the way, that there is no visible necessity for a clergyman going to balls at all. However, Julian in the story, after sustaining a mortifying rebuff from society, determines to take himself and his wife to some colony which the novelist does not particularly specify. The colonies are a valuable resource alike in fact and fiction. We can no longer send our convicts to Australia; but perhaps a judicious exportation of other classes of soiled goods may still be practicable. Let us imagine a beautiful penitent taught at a Refuge to do useful things, and then supplied with the *means* of emigration to—no matter where. Some colonist in want of a wife would accept the damaged article, and abstain from disquieting investigations. It appears, therefore, that the case of Mercy Merrick would be less hopeless than is represented, although we should not expect her deliverer to be a clergyman. But, taking the case as it is stated, the author can hardly intend to complain of society because it endeavours to fence itself against Magdalens. The story after all is well enough in a book, where the absurdity of some of the characters and situations appears less distinctly than upon the stage. Readers of the novel escape the elocutionary tricks of the theatre, and may skip any page of sermonizing which they find dull.

REVIEWS.

HENRI MARTIN'S CELTIC ARCHÆOLOGY.*

THE pieces which make up M. Henri Martin's present volume were written at various times from 1861 to 1871. They give us the author's impressions on various journeys in Wales, Ireland, Britanny, Sweden, and Denmark, undertaken mainly with antiquarian and ethnological objects. He gives us essays on the early inhabitants of Gaul and Britain, on the Megalithic monuments, on the alleged remains of ancient British literature, winding up with an account of an international Archæological Congress at Copenhagen. This last leads to some of those political speculations which can hardly be avoided in the Scandinavian lands, where every man seems to be at once a politician and an antiquary, and where the past and present do run more closely into one another than in most countries. In 1869 M. Martin was hoping for the recovery of North Sleswick for Denmark—a hope in which none will join him more readily than the friends of Germany—and was further dreaming of great things to be done by the union, if we rightly understand him, of France, South Germany, and the lesser powers against Prussia. Then come some asterisks and some further reflections with the date "Octobre 1871"—the burden of which is that "l'idéal s'est englouti dans une affreuse

* *Études d'Archéologie celtique. Notes de Voyages dans les Pays celtiques et scandinaves.* Par Henri Martin. Paris: Didier et Cie. 1872.

réalité." In this state of things M. Martin can only comfort himself with four Welsh Triads, the last of which promises—without fixing the date—a good time coming, when light, truth, and life shall destroy all evil, and, we suppose, the German Empire as one form of it.

The form of the work, that of essays alternating with notices of M. Martin's travels, makes the book more lively to read, but it certainly makes it harder to carry off M. Martin's exact notions on scientific questions. Some of the essays stand quite by themselves as distinct dissertations. In others the account of the journey is largely mixed up with the various subjects of discussion which the journey itself suggests. M. Martin is an earnest Celt, and we have no quarrel with him for being so. The Celtic school of French history and antiquities, whatever may be its faults and temptations, is at any rate a great improvement, in point of historical accuracy, upon the older French school which confounded the German Frank and the Celtic Frenchman, and which babbled about Pharamond, Clovis, and Charlemagne as French national heroes. We do not see that M. Martin carries his Celtic feeling so far as to see, with Thierry and others, nothing in all later French history but a struggle between an oppressive Teutonic nobility and an oppressed Celtic people; still he starts, as we hold that he ought to start, from the conception of the French people as a people essentially Celtic. All that we complain of is that M. Martin sometimes allows himself to be led astray by his Celtic brethren in other parts. He comes into Great Britain, and, as far as we can see, he looks upon England as little more than the road by which he is to get into Wales. This perhaps in itself is natural. The thing which makes M. Martin's speculations less valuable than they might be is that he swallows everything that his Welsh friends choose to tell him, without any kind of doubt, without any kind of scientific examination. He goes to an Eisteddfod in perfect seriousness, and he believes in Mr. John Williams ab Ithel, the memorable editor of the *Annales Cambriae* and the *Brut y Tywysogion*. In short his Welsh friends seem to have told him some very strange things indeed. He gets to Caernarvon, but, so far as he is concerned, Mr. Hartshorne might as well never have been. Here are his reflections:—

Je passai par Caernarvon, afin de visiter le château, très-belle et sévère construction du xiii^e^ siècle, bâtie par le conquérant Edouard I^er^, le *bardicide*, comme l'appellent les Gallois, pour tenir en bride la Vénédotie. Ce fut là qu'il éluda le traité par lequel il avait juré de laisser aux Gallois un prince de leur nation. Il amena sa femme accoucher dans le château de Caernarvon, et, montrant par la fenêtre au peuple l'enfant qui venait de naître en Galles: "Le voilà," dit-il, "le prince gallois que je vous ai promis!"

Now this is really too bad. One who has written the history of France in many volumes ought surely to know more of English history than this. But he has seized upon one idea which must be purely his own, and which we cannot believe that any ancient Briton ever told him. He goes to Bangor—we mean the episcopal city in Caernarvonshire—and there muses after this sort:—

C'est sur ces plages, en avant des collines et des rochers de Bangor, que douze cents moines, tout un peuple de bardes chrétiens, pareil à notre cité monastique des îles de Lérins, marchant sans autres armes que leurs chants sacrés au-devant des Saxons victorieux, furent exterminés jusqu'au dernier par ces barbares. Un vieil air populaire, empreint d'une religieuse et sombre majesté, a consacré la mémoire du massacre de Bangor.

He goes on in the same paragraph to talk about the massacre of the Druids by Suetonius Paullinus in Mona as having happened within sight of the scene of the massacre of the monks by Æthelfrith. The confusion of the two Bangors might by itself be pardonable, as monks from the Caernarvonshire Bangor might have marched to the neighbourhood of Chester. But when a man places the victory of Æthelfrith on the shores of the Menai, it shows that he can have no notion whatever of the real course of English, and therefore of British, history. He may have listened to Druids, Bards, and Ovates, but he cannot have turned a page of real history, he cannot even have looked at a map. We wonder what M. Martin would think if an English writer should give out that Count Eustace of Boulogne reigned in a wood close to Paris, or that the Nicene Creed was drawn up at that Nicæa which modern events have made a part of French territory.

Nothing very much can come when a man sets out on his Welsh journey with his head full of Druids, harps, and Triads, and with no more knowledge of the real history of the country than this. After this, it is a small matter that one of the present members for Glamorganshire should be turned into a Turk in the form of "Hussein Vyvyan," and it is a real ground for thankfulness that M. Martin, when he gets to Bristol, stops to explain that the Avon there is not the Avon of Shakspeare. To be sure the very name of the stream would set any man going who cared about British matters in a rational way; he would be prepared and rejoiced to find as many Avons in Britain as there really are; but when a man does not know that there are two Bangors, it is something that he should know that there are at least two Avons. In Ireland M. Martin fares better; the island to be sure is Celtic, but there is no temptation to people it with what M. Martin calls "Cymrys," as the translators of the Bible talk about "cherubims." He believes many wild things in Ireland as well as in Wales; but we can forgive him a good deal on account of the clear and undoubting grasp which he has gained of the real origin and meaning of the round towers. But he firmly believes in the God Crom, the supreme deity of the ancient Irish, who, we grant, appears in an early page of the Four Masters, as to be sure Dagon does in an early legend of Winchester Cathedral. Yet we have a very distinct remembrance that, so long ago as 1849, at the Cardiff meeting of the Cambrian Archæological Association, Dr. Todd, like another Mahmoud, smote the God Crom, and ground him small to powder, and cast the dust of him into the Taff. Yet here he has somehow come up again into life. Still, as M. Martin does not think that the round towers were built in honour of Crom, we are not inclined to quarrel with him over the ruins of a despised broken idol.

On his way to Ireland M. Martin went to Oxford—"la cité universitaire où fleurissent en paix tant de traditions et d'usages qui sont à peine ailleurs des souvenirs." But he corrects himself:—"Cité universitaire est trop peu dire; l'Université elle-même est la cité, dont le reste de la ville n'est qu'une dépendance et comme un faubourg." This, be it remarked, is in 1862; the notion seemingly implied that the city of Oxford grew up round the University might have been held in honour ten years later. But there are several things in M. Martin's description of Oxford which remind us that it is not a very new one. Oxford was, when he was there, a "vaste et calme nid d'études," untroubled, we suppose, by athletics. He met there a class of people called "les graves *fellows*." Nowadays, to say nothing of the question of gravity, it is commonly said that Fellows of Oxford Colleges are to be found everywhere except in Oxford, and that people of every kind are to be found in Oxford except Fellows of Oxford Colleges. Then he tells us about "les constructions modernes ayant été rebâties sur le plan des anciennes, pour ne point faire tache dans l'ensemble." It is plain that M. Martin was at Oxford before the building of that series of outlandish piles which has at last culminated in the cathedral meat-safe. Still, even at Oxford, M. Martin is a little shaky in his dates. He tells us how

le puseyisme, un jour, installe la Madone sur la façade d'un collége; le pur protestantisme répond à ce *quasi-papisme* en élevant une imposante croix gothique, couverte de sculptures, à la mémoire des *évêques martyrs*, c'est-à-dire de Cranmer et de ses collègues, les évêques brûlés par ordre de la *sanglante Marie*. On fait combattre ainsi le xvi^e^ siècle avec le xiii^e^; cela ne sort pas du style du viel Oxford.

Why the thirteenth century passes our power of guessing. But does M. Martin fancy that the gate at Magdalen, which we suppose is the one which he means, was built before the Martyrs' Memorial?

In another chapter M. Martin visits Britanny, where he again finds the God Crom, and has some mysticism about him which we cannot profess to follow:—

C'est le nom du dieu de la plus vieille race celtique, des Gaëls d'Irlande; nom qui tient aux racines même de la haute antiquité; il a dans les langues celtique et germanique le sens de *courbe*, la *courbe* génératrice du *cercle*; c'est l'Éternité engendrant le Temps; le dieu Crom répond en ce sens à ce qui est, dans la mythologie grecque, *Ouranos*, le Ciel, engendrant *Kronos* ou Saturne, le Temps.

It is well known that, according to all orthodox mythology, the relations between Kronos and his father Ouranos were far from being always friendly. We are also given to understand that the Carthaginian God whom Greek writers speak of as Kronos was in truth no other than Moloch; it is therefore in no way wonderful that Crom and Moloch, if they ever met, should not have been on the most loving of terms; the only wonderful thing is that they ever should meet. But M. Martin, who in one spot of Britanny finds a rock of Crom, in another place finds a rock of Moloch. "Ce nom," he tells us, "en dit assez. Le Dieu infanticide des Phéniciens, Moloch l'impitoyable, aurait donc eu là son autel." Then we get a picturesque scene, from which we might almost expect to have the battles of the Gods and the Giants, the *epos* of Claudian and Mr. Trollope, fought over again on the British shore:—

En face du rocher de Moloch surplombe sur la mer, au bord du continent, une autre masse appelée le *Roch-Chrom*, comme si le dieu celtique, le vieux Crom, se levait pour défier le dieu étranger.

We are more concerned to think that, whatever might be the relations between Moloch and Crom, in our island at least Woden showed himself a good deal stronger than either of them.

But M. Martin lights on one fact which is of some importance. He mentions a small district of Britanny where M. Villemarqué says that the inhabitants are known by the name of *Combris*. He adds that many traditions and local names connect them with a colony of "Cymrys" who came in the fourth or fifth century—that is, we suppose, the great Armorican migration. But it is worth noticing that he adds, "C'est la seule trace connue du vieux nom cimbrique dans notre Bretagne." M. Martin assumes throughout that *Cymry*, *Cimbri*, *Cimmerii*, are all the same. Indeed it is essential to his argument throughout that they should be the same; but it is an assertion which needs proof; it is no more to be taken for granted than we can take for granted that *Alba* in the sense of Scotland, *Alba Longa*, *Albania* by the Hadriatic, and *Albania* between the Euxine and the Caspian, are all the same name. Lord Strangford used always to insist that there was no evidence for extending the name *Cymry* to any people except the Welsh of Wales proper; he would not even allow it to be applied to the Welsh of Cornwall. M. Martin's incidental admission that, with this one very doubtful exception, the name is utterly unknown in Britanny, thus becomes a fact of no small importance.

M. Martin has an essay on the Megalithic Monuments, the great object of which is to show that, of the two stages of the Stone period which are now commonly recognized, the later and more finished kind are the work of Celtic hands. We ought perhaps to mention that, though M. Martin has got too far to believe that cromlechs are Druid altars, yet he believes that he has found

some Druid altars as well. It must of course be borne in mind in reading M. Martin that what we call a croulech he naturally calls a dolmen.

Lastly, as we said at the beginning, M. Martin goes into Denmark and Sweden, and, like most people who go there, was much pleased with what he saw; only part of his pleasure was because he finds, as he thinks, the Northern Teutons much more like Frenchmen than they are like Germans. But he tells us, with an amiable simplicity which we have noticed in several other travellers who have made the same remark, that "La première province suédoise, la Scanie ou Scandinavie proprement dite, ressemble beaucoup plus au Danemark qu'au reste de la Suède"—that is to say, Elsass is much more like Germany than the rest of France. Does M. Martin really not know that Scanie became Swedish and Elsass became French much about the same time? In another place we see that, perhaps by a graceful bowing to circumstances, M. Martin talks about "la Lorraine *welche*," very properly printing in italics the word which is Welsh to him. It rather reminds us of the Persians in Æschylus, or of Plautus saying of himself,

Menander scripsit, Marcus vortit *barbare*.

THE INTELLECTUAL LIFE.*

THIS interesting little book is in form a series of letters addressed by Mr. Hamerton to a number of persons in widely different situations, but resembling each other in a common desire for intellectual culture. All who are born with the necessary faculties, says Mr. Hamerton, are impelled to the intellectual life by an instinct like that which drives ducks to the water. Unluckily, however, it is impossible for a human being to abandon himself to his instincts as freely as a duck. In every position he will find many difficulties, although those difficulties may in some sort be converted into advantages. "The intellectual life," therefore, "is always a contest or a discipline"; and the art of living intellectually consists, not in removing all stones from our path, but in forcing the very stones to preach to us. Mr. Hamerton goes systematically through the various influences by which we may be surrounded. He speaks of the physical and the moral bases of intellectual life; of the influences of education, of wealth, of marriage, of society, and so on; and endeavours to point out how, under every conceivable variety of condition, a resolute man may best train his intellect to active and systematic effort, directed to worthy objects and giving him the noblest pleasures.

All books constructed upon such a plan are in danger of being commonplace or paradoxical. The maxims about the conduct of life which we are capable of discovering are very short and simple. If we desire to say anything original upon such well-worn topics, we are strongly tempted to make a sacrifice of the truth. It is wearisome to say over again that honesty is the best policy; and it is paradoxical to say that it is the worst policy. Or, to take a question actually treated by Mr. Hamerton, what can we say that is at once new and sound about the influences of money? It is obvious to remark that great wealth has many temptations, that the student who is under no compulsion to labour for his bread is apt to become finical and dilatory, and to allow his time to be absorbed in working the pompous apparatus of a stately existence without ever finding leisure for serious industry. It is obvious again to remark that a man living from hand to mouth, and pursuing knowledge for mere pot-boiling purposes, can never do full justice to his powers. And it might be added that a man fortunate enough to be free from grinding anxiety, and from the burden of excessive wealth, has nevertheless temptations of his own, and is apt to be specially in bondage to the iron laws of respectability. These and a good many other remarks of no great novelty are naturally made by Mr. Hamerton; and he is too much in earnest in his teaching to spice them with paradox. But, commonplace as the substratum must necessarily be, Mr. Hamerton succeeds in being almost invariably interesting. We do not say that he never falls into platitude. That is a compliment which we could not conscientiously pay to any writer of moral essays with whom we are acquainted. But he succeeds in so illustrating old truths that they come with a certain agreeable freshness. We see that they have passed through the mind of a thoughtful and cultivated man who has tested them by his own experience, and who therefore unconsciously enforces his precepts by example. The real influence of such books depends, not upon their telling us anything that we did not know before, but upon their showing how the familiar truths have operated upon the preacher himself.

To review such a book by expounding its theories would therefore be to do it injustice. Translated into mere blank formulæ, it would necessarily lose its charm. We will therefore take a chapter as a specimen; though we must add the warning that our choice must be guided, not by the excellence of the principles asserted, but by the opportunity which they afford for discussion. Mr. Hamerton, for example, attempts in one of his letters to answer the question which of the moral virtues is most essential to the intellectual life? He answers unhesitatingly that the most essential virtue is "disinterestedness." Disinterestedness, in Mr. Hamerton's sense of the word, means the absence of partisan spirit. Its value is proved by a simple argument. In every age of the world, he says, there have been men who possessed all the other virtues, such as industry, courage, humility, and so on, and have yet been opposed to intellectual liberty. The Ultramontane party at the present day, for example, includes men of ability and cultivation, and possessing nine-tenths of the qualities which are necessary for the highest intellectual life; and yet, instead of helping on the intellectual advancement of mankind, they do their best to retard it. They can discuss all other questions reasonably enough, but as soon as the discussion has the remotest bearing upon ecclesiastical topics they are instantaneously converted into passionate advocates. So far as any one else has the same spirit, he is guilty of the same error. An Englishman, for example, cannot form a just theory as to the proper policy of the French people at this moment if he has a strong prepossession in favour of Conservatism or Republicanism. In either case he will be unable to appreciate the purely intellectual bearings of the problem.

Mr. Hamerton is here raising a rather difficult question, and we should demur to the completeness of his statement. If for disinterestedness he would substitute the word candour, we should agree that the virtue is one of great importance. Readiness to listen to all sides of every question is necessary to the judicial intellect. Mr. Hamerton, however, expresses himself rather as if he meant that, besides being candid, we ought to be absolutely undecided. A strong predilection for democracy or monarchy doubtless implies a temptation to judge unfairly of M. Thiers or M. Gambetta. But, on the other hand, how can a man take any interest in politics unless he hopes to arrive at some definite conclusion? Nobody can form any judgment, again, of a religion unless he is capable of sympathizing with the religious instinct. A man devoid of the emotions of love and reverence would be without the materials for forming a judgment of the creed which he associates with them; and yet, if they are strongly developed in him, he can scarcely avoid being prejudiced in any argument bearing upon the truth of the creed. Hence the difficulty is that a man should be capable of being at once a judge and a witness; and that he cannot arrive at a satisfactory judgment unless he is also capable of bearing strong testimony. To reconcile these characters, to be at once strongly convinced of the truth and importance of a given opinion, and yet to be perfectly ready to give a candid hearing to its opponents, is the great difficulty which Mr. Hamerton passes rather too lightly. But beyond this is another question. Why should not a strong partisan lead an intellectual life? Do not many Ultramontanes, for example, lead intellectual lives? Mr. Hamerton apparently argues that they do not, because the result of a prevalence of their opinion would be fatal to intellectual progress. We agree with the statement of fact, but we rather doubt the logic of the argument. A man may lead a thoroughly intellectual life though his opinions are erroneous, and even disastrous in their consequences. An Ultramontane, for example, and most other people besides Ultramontanes, would say that materialism would, if triumphant, be fatal to intellectual progress. Yet a materialist may be thoroughly "disinterested" in the sense of being ready to listen to all arguments, and of having no strong prejudices. The chances are, indeed, that his blindness to certain truths will predispose him to be calmer and fairer than men who have a strong sense of the value of spiritual beliefs. The fact that a given opinion is injurious does not depend upon its advocates being prejudiced in its favour, but on the falsity of the opinion. Agreeing therefore most fully in the importance of cultivating candour, or "disinterestedness," as a rule of intellectual hygienics, we do not think that it is, properly speaking, essential to the intellectual life of the individual. It is essential that a certain freedom of intellectual play should be allowed, or the intellect would be petrified; but even an absence of prejudice is not so important as a strong interest in the question at issue. Perfect disinterestedness is compatible with, and may even be a result of, absolute indolence. Nobody is so impartial as the man who is devoid of all ideas whatever.

In its artistic bearings the doctrine is still more doubtful. Candour is essential to a philosopher, but hardly to a poet. Milton was not "disinterested" in the sense of being free from passionate party feeling; nor were Shelley and Byron. Mr. Hamerton remarks indeed that our best poets choose subjects in actions long past in order that they may not be distracted by present interests. The conquest of the two Sicilies by Garibaldi, the death of Maximilian, or the siege of Paris, would, he thinks, afford the finest possible subjects for epic poems or dramas; but they have not been treated, or, if treated as by Victor Hugo, have led to lamentable failure. Again we may admit the fact, but deny the inference. Epic poetry has gone out of fashion at the present day, and we may doubt whether it is ever likely to reappear. But certainly most of the noblest lyrical poetry of this and of all other times has had reference to circumstances of recent occurrence. In any case, the objection to making Garibaldi the hero of an epic poem is surely not that we are too much interested in his adventures. The real difficulty is that a poet shrinks from coming into contact with the vulgarizing associations of recent events; he does not wish to be a competitor with newspaper correspondents, or to have his imagination bound down to the literal truth of history. The first condition of success is that he should move in an ideal world, where characters and events may go through a certain transfiguration. How can a poet write freely if he is liable to be attacked by arguments such as those directed against Mr. Kinglake's account of the battle of the Alma, and to have the wings of his imagination

* *The Intellectual Life.* By P. G. Hamerton. London: Macmillan & Co. 1873.

weighted by statistics and Parliamentary returns? The objection to a very recent motive for a narrative poem is that the mere external husk is too obtrusive to be removed, and that history requires to be exposed to the dissolving influences of time before the husk drops off and the deeper meaning becomes evident to mankind. A century or two hence we shall see what part Bismarck or Napoleon really played in the great drama of the world's history; at present we are too close to see them in undistorted perspective. Such objections are generally conclusive against epic poetry as applied to recent events; but they are not founded upon the difficulty of being disinterested. On the contrary, it seems to us that it would be more plausible to say that no man could be a genuine poet or artist who was not profoundly moved by the subject with which he deals; and, unless he has the breadth of mind of a Shakspeare or a Goethe, to be profoundly moved means to be a warm partisan.

We have unintentionally fallen into controversy with Mr. Hamerton, and have thus been delayed over one of the less satisfactory chapters of his book. We must therefore conclude by saying that even this chapter is at least suggestive of many reflections, and that in most of the remainder we are not only stimulated to think, but are also inclined almost always to agree with him. We have read the whole book indeed with great pleasure, and can recommend it strongly to all who can appreciate grave reflections on a very important subject, excellently illustrated from the resources of a mind stored with much reading and much keen observation of real life. The artistic remarks are always, as might be expected, specially interesting, and there are many striking anecdotes from Mr. Hamerton's personal experience.

NEWMARKET AND ARABIA.*

(*Second Notice.*)

WE resume our consideration of Captain Upton's pleading on behalf of the Arab. Agreeing with him in much that he says about his favourites, we think that he damages his cause by attempting to prove too much. Before, however, minutely examining certain details of pedigree, &c., on which he insists, we should like to call his attention to the principal point of difference between us. Captain Upton is so anxious to ascribe all the faults—growing faults as we both think—of the English thoroughbred horse to an increasing distance from Arab progenitors, and to the admixture of other blood, that he sides with Admiral Rous as to that branch of the Admiral's optimism which is most in the way of all hopeful reform and improvement. They both insist on the absolute necessity of subjecting yearlings and two-year-olds to severe work, if they are ever meant to race at all. Captain Upton, in support of his opinion, summons Abd-el-Kader into court. Now, without attempting to estimate Abd-el-Kader's authority in such matters, this at least we may say of him, that, if quoted at all, he ought to be quoted with perfect accuracy. But, unless our memory deceives us, Abd-el-Kader, though in teaching his two-year-old to gallop he might press him rather hardly at first (for the sake of the two-year-old, by the way, not to win other people's money), prescribes almost perfect rest and careful feeding from three to four. This he does that his charger may then be fit—not according to our familiar metaphor, but in the literal Bedouin sense of the term—"to run for a man's life." The pressure which Abd-el-Kader relaxes at three, we intensify, and the consequence is, that instead of being able to run for a man's life at four, the majority of our racehorses, unless thought good enough to breed from, are hardly up to real continuous work of any kind. Our opinion accordingly, right or wrong, is altogether a different one. We believe that our two-year-old colts are offered up to Moloch—we beg his pardon, to Mammon we should say; that young creatures of brilliant promise, like Scott's "brother to Ainderly," &c., are broken on the wheel of our present training routine; so that some of the very grandest animals—those we mean who, though perhaps overgrown and irregularly developed, would mature into splendid specimens of horseflesh—have their legs ground, as it were, to powder whilst babies, being, by a phrase unintentionally happy, "put through the mill," as it is called, to see if money can be got out of them. They vanish away like shadows, they become mere phantoms—"Pullorumque animæ flentes in limine primo"; dead horses, we believe, is the technical and professional term. Now when we regret that such young things cannot be spared from violent training till the gristle of their frames has hardened into something approaching towards bone, we should have thought it was admitted everywhere that overwork is injurious to the young; we should have thought this proposition indeed a truism rather than a live truth—a truism applicable to whatever is born, colts and fillies, boys and girls, greyhounds and game-cocks, elephants and camels alike. But Captain Upton, holding a special retainer for the Darley Arabian, and Admiral Rous caring little, provided Newmarket goes smoothly on, whether the Beacon course is run over in four minutes or in forty, would have us believe that a particular Providence has exempted young racehorses from the operation of this universal law. To this we demur. Admiral Rous is, however, at least consistent with himself. Wholly sceptical as to Childers and Eclipse, Firetail and Shark, Goldfinder and Bonny Black, he cares nothing how they were trained, or indeed whether they were ever trained at all. But Captain Upton's faith in Childers is unbounded, twenty times stronger than our own; he has moreover a confidence in the excellence of the pre-Childerses in general. Yet he knows, or ought to know, that Childers did not begin his gallops till he was seven (Eclipse not until he was five), and the pre-Childerses for the most part somewhat late in equine life.

The story of Flying Childers as it comes from Cantley, the home of the Childers family, is this; and a very curious story it is, as illustrating what is called the glorious uncertainty of the Turf, so that perhaps our readers may be interested to hear it. Childers was foaled in 1715, at a place called Carr Farm, near Doncaster, and was thought so little of that, when the Duke of Devonshire purchased some blood stock of the then Squire of Cantley, he was actually thrown into the bargain for nothing. The Duke used him as a hack, and sent him to the post town, we believe, to fetch his letters. This continued till by mere accident his speed was discovered. His superiority was then found to be so great that after a race or two nobody would oppose him. Thus he remained the undisputed monarch of the racing world from seven till ten, when he was put to the stud. Whether he was ever tried in private against Bonny Black, also a foal of 1715 and the greatest winner of her time, we do not know. They never met in public. It is to him that the Darley Arabian owes his high reputation as a sire (to him, and perhaps to another horse, whom Captain Upton calls his brother), for Captain Upton must know that other brilliant sons of that Desert prodigy, such as Almanzor, foaled in 1713, Almanzor's brother, and the like, would have failed altogether to keep his memory alive. It is upon Childers, as we have said, and Bartlett's Childers, that his fame mainly depends. Now Captain Upton assumes (for his purpose it is most important to assume) that Bartlett's Childers, who never was trained, but who has his own niche in the temple of fame, as the direct male ancestor of Eclipse, was full brother to Flying Childers. He was not, at least there is no reason whatever to think so; what Cantley says upon the subject is this:—"He was not brother to Flying Childers—that is all we know about him certainly. He may have been his son" (which is not claimed for him or hinted at in the Stud-book), "but he has no local habitation or name in our traditions." The Advocatus Diaboli, in pleading against his equine canonization, would undoubtedly argue that, not being brother to Childers, and not even claiming to be his son—we may put aside any relationship as quite unproved—that the horse was called Childers to catch unwary breeders, as Hamburg sherry is called Amontillado to deceive unwary wine-bibbers, and that the name really amounts to nothing as connecting Eclipse with the Darley Arabian blood. We do not go quite as far as this; we do not deny that he belonged to that family; but the fact is not proved, and if he does not belong to it, half, perhaps the larger half, of the Darley Arabian's pretensions falls to the ground at once.

We must add that Captain Upton, in echoing an old criticism upon Eclipse—namely, that his descendants were speedy rather than game and enduring—forgets that these latter qualities are those specially promised to us if we trample upon Barbs and Turks, and return to pure Arabian blood. This infirmity of the Eclipses, therefore, does not tell in favour of the Darley Arabian. Old Yorkshiremen, on the other hand, used to inform us, fifty years ago, that Matchem, of the Godolphin line, a line which Captain Upton hates and despises, was the horse to breed back to, if stoutness were required. Now there being, as everybody knows, three distinct families of the English racehorse, the whole object of Captain Upton's book is to show that two of them are comparatively worthless, and that the Darley Arabian, mainly because he is an Arabian, was entitled to look down upon the Byerley Turk and the Godolphin Barb as intrusive plebeians without any real title to take rank with him. We do not deny that the Darley Arabian is probably *primus inter pares*. But, after all, the Byerley Turk, as the direct male ancestor of Herod, Highflyer, Woodpecker, Selim, Sir Peter, Haphazard, Filho da Puta, Bay Middleton and others—the Godolphin Barb as the great-grandsire both of Eclipse and of Highflyer—have something to say for themselves. Moreover, this primacy of the Darley Arabian, as we have said before, depends almost entirely upon what we think of Bartlett's Childers and his pedigree. The statement respecting this in the Stud-book is quite candid, but flagrantly inconclusive. We are informed that several (anonymous) gentlemen of honour have assured the editor that, though he was never trained, for which no reason is given, no special infirmity pretended, he was still own brother to Flying Childers. To these gentlemen of honour, as we have said, the racing traditions of Cantley give the lie direct. If the precise blood-relationships of Bartlett's Childers were thought worth inquiring into, why was no inquiry instituted among the clodhoppers for twenty miles round Carr Farm? We venture to say that, unless Yorkshiremen at that time were very different from what they are now, there was not a gamekeeper or cowboy within a day's journey of the place who could not have thrown more light upon the matter than any twenty anonymous gentlemen of honour from the wrong side of the Trent. Assuming, however, if Captain Upton pleases, that Bartlett's Childers was of the Darley Arabian line, we take him, as we said, to be *primus inter pares*. But what of 133 other Arabians recorded in our Turf history? No one of them can compete with the Byerley Turk or the Godolphin Barb as co-founders of the English blood-horse. Of the Godolphin Barb we may also say that, having been introduced into the

---

* *Newmarket and Arabia: an Examination of the Descent of Racers and Coursers.* By Roger D. Upton, Captain late 9th Royal Lancers. London. Henry S. King & Co. 1873.

country at a much later period than either of his rivals, it is not wonderful if his quarterings are not quite so numerous. What the Stud-book says of him is this:—"For many years no superior horse has been seen upon the Turf without an infusion of the Godolphin blood." Captain Upton again, in going back to the origin of the English racehorse, underrates Charles II.'s Royal mares; whether one of them came from Hungary or not we cannot say, but it never seems to occur to Captain Upton that during the reign of Charles II. Tangiers, a town and district of Barbary, was an English possession, and that it was no doubt the facilities arising from this fact which acted upon Charles, and led him to import his mares. We feel, whatever Captain Upton may feel, that these Royal mares were much more certainly Barbs than that Bartlett's Childers was of the Darley Arabian line; nor does Captain Upton even raise, much less solve, the question whether the Arab and the Barb do not mix their blood with good effect.

As for Captain Upton's laborious attempts to reckon up the pedigrees and describe the races of the last hundred years, we can only say that they are tiresome without being in the least instructive. He has no living knowledge of the contests about which he speaks. To him a winner of the Derby is a winner of the Derby. Mundig takes rank with his predecessor Plenipotentiary and his successor Bay Middleton, as if a horse such as Mundig could have approached either of them, though carrying a stone less. Nay, we almost believe that Bay Middleton, if he had been allowed to start in 1835 when a two-year-old, might have won the blue riband of the Turf twice over. This is the way in which Captain Upton goes on discoursing:—"Filho da Puta won the St. Leger but was beaten by Sir Joshua." Beaten by Sir Joshua no doubt; so was Priam by Colonel Wilson's b. c. Chapman by Emilius; so were Beningbrough and Benington, the best horses of their day, by Mr. Garforth's grey Phœnomenon colt with 40 to 1 against him. We have often heard of the roar of astonishment that broke out, after a moment of eager silence, from the bewildered mass of Yorkshiremen, when the two great horses, treating the race as a match, had run themselves to a standstill and left the plater to come up with them, and then canter home alone. Now, without underrating Sir Joshua, undoubtedly a good racer, he cannot be compared with Filho da Puta, the last perhaps of the heroic horses. Captain Upton does not tell us how often, or by whom, Sir Joshua himself was beaten; he gives us no hint that he was running over his own distance and at his own headquarters, or that he was receiving 7 lbs. from his opponent. As to Filho da Puta's race at Northallerton for the cup (four miles), there is no evidence that he has ever heard of it. On that occasion Filho da Puta, contending with many dangerous antagonists, bolted, lost two hundred yards, was brought back into the course and set to work again. He recovered his lost ground marvellously, passed horse after horse till he collared Mr. Watt's famous mare Altisidora, herself a winner of the St. Leger, just upon the post, achieving thereby a victory almost unparalleled, in spite, we may say, of fate herself. Again, he tells us that the Flying Dutchman and Voltigeur ran their two miles at York in two minutes and fifty-five seconds. Very likely; but, not to mention that neither horse, as we believe, was within one-and-twenty pounds of his true form (for Voltigeur we can answer), Captain Upton either does not know, or does not say, that the course was so heavy that, after mature consideration, it was decided by Voltigeur's partisans for him to make the running, mainly to give him the best chance of first seizing upon a comparatively firm strip of ground, on the other side of Middlethorpe corner. Finally, after an enormous parade of statistics as dry as hay, he comes to this conclusion about our most recent racehorses:—That Blue Gown is the highest bred and the one to rely upon above all others; Rosicrucian, whom Sir Joseph Hawley, apparently with excellent reason, thought much more highly of, being, he thinks, "only a handsome coach-horse in comparison." In this opinion we should fancy he stands alone. At any rate he has not cared to remember that if gameness, and the power of gallantly carrying home heavy weights over a long distance, are the qualities which make an Arabian valuable, in these qualities "the plebeian coach-horse Rosicrucian" was far superior, and, so far, more of an Arabian than his patrician half-brother.

What then are we to say of Captain Upton's book upon the whole? Why that it is the work of an able pleader rather than of a judge. He does not prove that the Darley Arabian's excellence was an excellence differing in kind from the excellence of the Byerley Turk or the Godolphin Barb; for, if so, why have the last two horses driven into oblivion one hundred and thirty-three other Arabs commemorated in the Stud-book? why, also, in that case, was Almanzor so complete a failure? Secondly, he has not proved that a pure Arab is necessarily a finer horse than one of mixed Arab and Barb blood—an intermixture which constitutes, we believe, the true lineage of our thoroughbred horses. Thirdly, he has failed altogether in showing that an Arab can go as fast as an English racehorse. Till his Arab can go two miles and five furlongs in four minutes and ten seconds, two miles in three minutes and twenty-seven seconds, and one mile seventeen yards in a minute and a half, or till some Arab (with his allowance) wins an Ascot or Goodwood Cup, we must refuse to discuss the point. In giving the above times, we are speaking of modern races within our own cognizance; we suppress what we have heard, and believe (more or less) about Hambletonian and Cockfighter, Firetail and Shark—knowing full well that, if we revealed all our credulity about them, Admiral Rous and the optimists would send us at once to Hanwell, and that with a light heart, according to M. Ollivier's phrase. But that the present state of the Turf is bad, and that a return to the good old times is in many respects advisable, our author has proved, we think, abundantly. Admiral Rous, we understand, objects to Childers that he never won races at all. This is true, but we conceive that the Admiral misses the right application of his own point. Public racing in those days was quite a subordinate matter; there were certain great houses, the Devonshires, the Rutlands, the Earls of Holderness, and the like, by the members of which the possession of a noble stud was looked upon, not as an investment, not as putting them in the place of dealers at vingt-un, but as part of their hereditary status and normal position in social life. It is by introducing large stakes, by surrendering ourselves to public trainers, by having turned a generous and gentlemanlike emulation into a sordid trade, that we are gradually ruining and obliterating our unrivalled breed of horses. Is it too late in some degree to revive the old system and to pursue it, at any rate in a parallel line along with the new? Is it impossible to persuade great proprietors who love their country, without being fond of gambling, to work as hard that they may produce the *Bellator equus*, that noblest of animals, "to whom God has given strength, whose neck he has clothed with thunder," as they now work to produce those uninteresting short-horns which, whatever mysterious merit they possess, give neither good milk like the Alderneys, nor good beef like the Scots; enjoying only, so far as we know, the one privilege of fattening easily in early youth. We beg pardon of our scientific agriculturists—we have no wish seriously to impugn the value of their labours; but, not having any farm to fertilize or rents to receive, Mr. Baker and his Herd-book are naturally less interesting to our Yorkshire feelings than the Stud-book and Mr. Darley, whose example we hope to see followed, if not surpassed, in every corner of the country.

A FAIR SAXON.*

THE title of this novel suggests an historical romance in which some blond Elfrida or Elgiva of the period of the Heptarchy will be found playing the part of heroine. The reader who takes it up with any such expectation is doomed to disappointment. The fair Saxon after whom it is christened is a young lady of the nineteenth century, whose nationality is of no significance except so far as it contrasts with the Celtic blood of her lover, an eloquent but impecunious Irish member of Parliament. The House of Commons plays no unimportant part in fiction. Mr. Disraeli has photographed some of its typical figures. Mr. Trollope has treated his readers to several lively sketches of its party-conflicts; and lady-novelists are never so happy as when they make their heroes rise from back benches to shake the Senate with their oratorical thunder. But hitherto, as far as we are aware, the Irish member, with his peculiar temperament, embarrassments, and aspirations, has remained unchronicled in fiction. This is not because the position of an Irish legislator is intrinsically devoid of interest, but because it involves a departure from literary precedent. Heroes of Irish story have usually been associated with another and a more exciting sphere of action. They have figured chiefly in faction fights, and agrarian riots, and midnight collisions with an alien soldiery. Their translation from this arena of thrilling adventure to the prosaic atmosphere of a British House of Commons, and the substitution of a mere seat below the gangway for any more forcible expression of disaffection to a Saxon government, are novelties, but novelties of a very wholesome kind, and of good augury for Ireland. We hail them as indications of the progress of the conciliatory ideas which the enlightened policy of recent times has introduced. It would seem that the Gladstonian messages of peace are beginning to bear fruit at last.

Nor is it the only merit of our author that he has struck out for himself a new and unconventional line. Not only has he been among the first novelists to depict an Irish member, but he has placed the Irish member before the reading public in an exceedingly favourable light. In spite of a certain vein of poetry and impulsiveness which sits very gracefully on the descendant of a long line of Celtic chieftains, Mr. Maurice Tyrone, M.P., tempers his patriotism with good sense and sound judgment; and we cannot but think that the great Minister shadowed forth in this work, "with a deeply lined and wasted face, and dark brown eyes glowing like those of a stag," would be uncommonly glad to find all Irish members as amenable to reason. Of course, like a true Irishman, he has his sentimental grievance, which will be best expounded by quoting the following conversation which occurs between him and Miss Jennie Aspar, the fair Saxon of the story:—

"We were conquered, you know," he began.

"Hundreds of years ago! Yes. Well?"

"We don't like the idea, even yet. We have never quite got over it. Good-humoured English people, who are winners in most things, can't understand that, and think us sullen and foolish, and impossible to please. I come of a family which for seven centuries has been always in rebellion. I am the first of my house who was ever willing to live in peace under an English Government. The Celtic nature is not the least in the world like the Anglo-Saxon. With us everything is a sentiment. We can't help it. English people don't understand that—can't understand it. There are times when I could laugh at my own folly, or feel ashamed of it; but I can't get over it for all that. What would you have?"

* *A Fair Saxon.* By Justin McCarthy. London: Tinsley Brothers. 1873.

"But you don't really want another rebellion?"

"Of course not. I am not a lunatic or a criminal; and, believe me, I am deeply attached to England and English people. But I cannot forget that I belong to a people and a family which suffered half-a-dozen conquests and countless confiscations. Perhaps this is absurd. We cannot help it. I told you once of the Banshee. Very well. The national fancy which originated the Banshee isn't quite the same as that which is represented by the Metropolitan Railway. We don't believe in the Banshee any more than you; but it is to us a thing intelligible and in keeping."

"Then do you mean that you and we—the Irish and the English—can never get on together?"

"Oh, no; but that people must not be surprised if the bond doesn't become close and living all at once. You must not be impatient. You must allow to the conquered the consolation of his grievance."

"So many hundred years," said Jennie, musingly, "and not forgotten yet!"

"Yet," said Tyrone, with sudden impetuosity, "I grow sometimes weary of the everlasting whine and moan, which never comes to anything. . . . We might at least have the dignity of patience and silence."

"When nothing can be done? You speak as if you were sorry nothing can be done. Isn't that very like what this paper says—as if you would be a rebel if—?"

"If I could? No. I wish for something better. So do we all, I hope—in Ireland, I mean. But there are moments, of course, when the old spirit breaks out, do what we will. Every Irishman who is not a lacquey or a coward is a conquered rebel, Miss Aspar, and nothing else. This seems an odd anachronism, does it not, in the nineteenth century, you and I talking together, in sight of Piccadilly? It is true though, all the same. Wherever you see an Irishman, you see a man separated from the English friend who converses with him by the fact that the Irishman always feels himself the representative of a lost cause."

At the house of a fascinating American widow, who has set her cap at him, Maurice Tyrone falls in with certain Fenian leaders, who vainly try to draw him into their plots. With a view to warn his misguided countrymen, he is induced to attend a Fenian meeting at the "Harp of Erin"—rather an incautious proceeding for a member of the British Legislature. A quarrel ensues between him and a cosmopolitan conspirator calling himself General Charette, who taunts him with cowardice, and, as the sequel to this, a duel is arranged, and only prevented by the sudden arrest of the General. This distinguished representative of lost European causes manages, however, to escape from prison, and throwing himself on the generosity of his late antagonist, begs for one night's concealment in Tyrone's London lodgings. His confidence is not misplaced; but the affair gets wind; a question is asked in Parliament, in reply to which Maurice admits that he has afforded shelter to Charette, whereupon there is a tremendous scene in the House, in the midst of which our young chieftain, after vainly trying to gain a hearing, bows to the Speaker, and brings his Parliamentary career to a close. It seems to have been his destiny to have, against his will, to shelter rebels. On paying a visit with a young friend to the ruin which had once been the castle of his ancestors, he finds it tenanted by two of his Fenian acquaintances who had taken part in an abortive rising, and were now fugitives from justice. Here they are surprised by the police, and in the affray Tyrone and his young *protégé* are wounded; but the owner of the ruins is happily able to explain his innocence of any complicity in the projects of the Fenians who had found a refuge among them.

The course of our hero's love affair is no less chequered than his political career. All sorts of obstacles crop up to retard the union of the patriotic Celt with his fair Saxon. Among these not the least formidable was an eccentric provision in the will of an Irish-American cousin, whereby a vast fortune was bequeathed to Tyrone, as the head of the ancient clan, on condition that he should not marry before forty. Two allies, from different motives, secretly scheme to bring about a forfeiture of this inheritance—Colonel Quentin, the contingent remainderman, and Mrs. Lorn, the coquettish American widow, who, having plenty of money, is bent on marrying the chieftain out of hand herself. Their intrigues are thwarted by his falling in love with the daughter of Mr. Aspar, a benevolent person with a Surrey villa, to whom he had had recourse, "not as a money-lender," but as a philanthropist "who looked into a gentleman's affairs, and if they showed any recuperative power, would constitute himself that gentleman's banker until things came right." The magical impression made on his susceptible Celtic bosom by Miss Jennie's sweeping her harp-strings to a wild native melody, soon ripened, under the sunny influence of certain flirtations in the Ladies' Cage, to a tender and romantic attachment. For the selfish scheme of Philip Quentin, it did not matter whether Tyrone married Jennie or Mrs. Lorn, so long as he married a wife before reaching the mature age of forty. But as in the progress of the story the Fenian colonel, who is in reality no Quentin, but a humble member of the American Tyrone family, manages to fall in love with Jennie himself, he could hardly be expected to promote her union with his rival. The blandishments of the rich widow proving ineffectual, other means are found to estrange the lovers. Jennie is made by a trick to believe in the unworthiness of her young Chieftain. The apparently equivocal position of an invalid lady and her child in his Clarges Street lodgings is made the subject of an accusation, which leads Jennie to break off her engagement with Tyrone, and to accept the *soi-disant* Quentin's offer of marriage. Of course it is all a mistake; the invalid lady being yet another member of the Tyrone family, whom our hero had befriended; in fact, no other than the daughter-in-law of the author of the eccentric will under which he was conditionally to inherit. Happily, under another limitation of the aforesaid instrument all intrigues are defeated, and a good slice of the American Tyrone fortune devolves after all upon the needy but chivalrous chief of the clan. Failing the condition of the deferred marriage, the money was to go to Philip Quentin; but upon his death, then, and then only, to the testator's prodigal son or his widow. Philip having been killed in the Fenian affray, and Tyrone having married within the prescribed term of celibacy, that contingency *now* occurred. It only remained for the grateful and moribund widow to make a will of half of her circuitously acquired fortune to Jennie Aspar, and promptly die on the grave of her late husband in Kensal Green. We need hardly add that the first act of the fair, and now penitent, Saxon is to bestow her fortune and her hand upon her true-hearted Celt.

This work does not show much constructive skill. The author is too fond of introducing details which have no influence on the issue of the story, and which only disturb the logical sequence of incidents. Nor does he possess the requisite subtlety of analysis to impart any great charm or interest to the relations between the hero and the heroine. His *forte* lies in a power of throwing off clever and dashing sketches of men and women, as seen from the point of view of a cheery cynicism. Mr. Prinker, the "eminent financier," and Captain Cadsby, the son of the Whig banker, raised "to the peerage for his eminent services in looking wise on the Ministerial side during five-and-twenty Sessions," and Mr. Granger, who "had once written a pamphlet, and was always ready to go on any deputation to any Minister," are lively accessories who flit across the book, and greatly contribute to make it readable. Mr. Hamilcar Halbert, the barrister of the Temple who comes over at a moment's notice to contest the county with Tyrone, is an amusing, and not, we suspect, an altogether imaginary, bit of satirical portraiture. Seeing a paragraph in the paper about Tyrone and his constituency, he sends for a bundle of Irish newspapers, and goes into the matter. Then he sends for the Nationalist Irish papers, and reads himself well up in Fenianism. Next he goes to the Temple library, and studies several books upon Ireland. Thereupon he boldly issues an address, in which he announces himself as an Englishman who deeply laments the wrongs done to Ireland, a Protestant who sympathizes with the legitimate aspirations of the Roman Catholics, and a Liberal resolved to embrace to the fullest extent the great principle of the rights of nationalities. Mrs. Lorn is a more finished, and although not a pleasant, yet a very life-like delineation. Her *minauderies* are redeemed by a vein of good nature and of generous impulse. There is nothing very bad about her; she is only a badly brought up, sentimental, and weakly mendacious woman, cursed with just brains enough to set her playing at intellect, and a bond-slave to her eyes and shoulders. A dozen times a day she was pathetic about nothing, only to give effect to those eyes; and cynical, merely to draw up, display, and let fall those shoulders. One day she would be full of yearnings for the cloister and heaven, only to declare on the next her contempt for the world's superstitious faiths. She liked to take little mental peeps at sin, and to hint mysteriously that nature had not many secrets from her. In the hands of a novelist of the irresponsible school such a character would be sure to become exaggerated and sensational; and it is to the credit of our author that he firmly refuses to degrade his art by any of the nauseous travesty with which we are only too familiar. There is one exception to the general sobriety of treatment which is a laudable feature in this work, Mrs. Lorn's little son Theodore. Imagine a boy of thirteen who could discourse of Schiller, Racine, and Heine, who had studied Darwin, and was fond of Quarterly Reviews; who talks of girls as "stunning," and calls for dry sherry at afternoon calls; and who finally imitates the example of his elders by falling in love with the heroine. Allowance made for the latest development of Young America, so insufferable an imp of precocity may still, we hope, be pronounced a caricature.

LETTERS AND PAPERS OF THE REIGN OF HENRY VIII.*

SEVEN huge volumes of this publication have appeared since 1862. We may probably allow for a preparation of three or four years before the appearance of the first volume, and thus we may reckon that one such volume on the average appears every two years. No one who knows the contents of such a work, and the labour of getting it up, will think that its progress is slow. We can only hope that Mr. Brewer may be spared to continue his *magnum opus* to the end of the reign of Henry VIII. He will then have produced a work the fellow to which will not be found in the history of any country. We need scarcely inform readers who know ever so little of the history of the reign that the value of such a Calendar and its interest by no means decrease as we reach the critical period from which what is called "the Reformation" is usually dated. The additional documents produced in this volume are of the highest interest and importance, and illustrate the diplomatic transactions between the Courts of England and France, and again between those of the Emperor and the King of England, in a wonderful way. We have often wondered what principle of selection guided the compilers of the State Papers of this reign published by the authority of Govern-

* *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.* Preserved in the Public Record Office, the British Museum, and elsewhere in England. Arranged and Catalogued by J. S. Brewer, M.A. Under the Direction of the Master of the Rolls, and with the Sanction of Her Majesty's Secretaries of State. Vol. IV., Part II. London: Longmans & Co., and Trübner & Co., Paternoster Row. 1872.

ment, and unquestionably the appearance of this volume does not help us to solve the difficulty. It is truly astonishing that some of these documents should have been overlooked, whilst on the other hand we can account for certain omissions when we see how many of the papers have been mutilated and misplaced, one portion being in one part of a volume, and the succeeding part being separated by an interval of several leaves. We observe also that the editor of the State Papers was somewhat shy of ciphered despatches, more particularly of such as were especially difficult to make out. About the middle of the present volume occurs the earliest document that has yet been brought to light referring to the divorce of Catharine of Aragon. It is dated May 17, 1527, and thus anticipates by several weeks the earliest paper that has been printed on the subject. But we reserve all notice of the divorce and the latter half of the volume for another occasion, and must make what selection we can from the miscellaneous farrago of documents analysed, including as it does domestic and foreign, civil and ecclesiastical papers of the highest interest.

The whole history of Europe is, in fact, illustrated in this volume. The letters written from Rome by Ghinucci, Bishop of Worcester, to Wolsey, are fortunately preserved almost without a break, though some of them have been dreadfully mutilated, and part of the contents of others has been a sealed book, owing to their never having been deciphered. They begin on August 15 and end on September 23, 1526, and the series sometimes contains two letters written on the same day—one referring to the affairs of Italy, and another on ecclesiastical matters which Wolsey was trying to manage in England. Those referring to the affairs of Europe are most important, and give a vivid picture of the Pope's helplessness and dependence upon Wolsey's influence with Henry for aid of men and money from England. Nearly all these letters are in the Cotton Collection, which is far richer as regards all this period than the Record Office. Ghinucci almost invariably begins his letters by reference to the date of his last letter; and here we may express our surprise that Mr. Brewer has not filled in a gap in a letter of September 5, which refers to his last letter written on some day *preteriti mensis*, with the proper date—for the previous letter of August 30 has been calendared in the volume—and, as the contents of the later document plainly show, is the letter referred to. It is the only fault we have been able to find with this volume, that there is a little want of uniformity in the amount of conjecture used to supply missing words and sentences in mutilated documents. So good a scholar as Mr. Brewer knows how tempting a snare it is, and he has avoided it with a self-abnegation which, it seems to us, has sometimes been pushed to an extreme. These letters also give a vivid picture of the consternation felt in the autumn of 1526 when the Turks had advanced into Hungary and had (August 29) won the battle of Mohats. "All Christendom is in danger from the Turk, now that the King of Hungary has been defeated and slain." Such is the summary of affairs hastily written by Campeggio to Wolsey. By the same post letters came from Giberto, Ghinucci, and from the Pope himself, announcing the same, and minutely detailing all the transactions that were going on when the fear was that the Emperor would establish a kind of universal dominion.

But a still darker period was drawing near, when Christendom was much more in danger from the atrocities practised by Christians upon their fellows than it had ever been by the threatened invasion of the Turks. The Sultan, instead of pressing forward as might have been expected, returned to Constantinople, and the prominent events of the next few months are the warlike operations which resulted in the sack of Rome by the Imperialists under Bourbon, May 8, 1527. Under these circumstances it was of no use for Sigismund, King of Poland, to address either Henry or Wolsey announcing the death of his nephew Louis, King of Hungary, and asking their assistance against Turk and Tartar and Muscovite, even though he could also detail the encroachments of schismatics. England had enough on its hands without interfering with the claims of the two rivals to the Crown of Hungary. The complications of the affairs of Europe were very great, and were partly owing to the family relations of the reigning monarchs. The widowed Queen of Hungary was the youngest sister of the Emperor, and his brother Ferdinand was one of the claimants to the Crown. The first dawn of another complication in the contemplated divorce of Catharine of Arragon had not yet appeared, and, important as was the influence that such an event was likely to exercise over the fortunes of Europe, Charles was as yet in profound ignorance of any such intention, which was as yet known only to the King, and Wolsey, and Longland, Bishop of Lincoln, the King's confessor; unless indeed Clerk, Bishop of Bath and Wells, had been made privy to it. We have searched the volume in vain for earlier notices of the divorce, and possibly a private letter written by Clerk, distinct from one of the same date written by himself and Taylor conjointly to Wolsey on the same day, may allude to it. There will be great difficulty, he says, *circa istud benedictum divortium; reliqua omnia sunt clara et succedent.* The words in italic are in cipher, and can, we think, allude to no other subject than the celebrated divorce; and, if so, they furnish some evidence in favour of the idea that it was first put into the King's head by Wolsey.

However, the Emperor was as yet in total ignorance of the project; and it is very interesting to follow in these papers the tortuous policy, now for the first time fully revealed, of the three Courts. Under the idea of a universal peace each prince was endeavouring to get the best terms he could for himself, and each pair seems to have been plotting against the third and providing for the contingency of a separate alliance. The documents contained in this volume would scarcely furnish material enough for any reader to guess what are to be terms of the peace agreed upon at Cambray in the autumn of 1529. The period is that which immediately follows the release of Francis from his captivity, and which was occupied by the negotiations for the marriage of Francis I. with the Emperor's sister, the Queen Dowager of Portugal, and those which it was desired he should enter into for uniting England and France in closer amity by the marriage of the Princess Mary, a girl of eleven, with Francis, or one of his two sons, the Dauphin or the Duke of Orleans. At first we have Francis protesting that, though he had promised to marry Madame Eleanora, he never had so great a mind to any woman as to the Princess Mary, saying that it was expedient for himself and his realm that he should marry her. The difficulty in the way of this was the captivity of the two princes, who were not to be released unless the marriage with the Queen of Portugal took place, and the marriage of the young princess with one of the sons only gave her a chance, instead of the certainty, of becoming Queen of France. After Ghinucci's recall from Rome the state of affairs becomes extremely interesting, for we have side by side the negotiations that were going on directly between the Courts of England and France, those which Lee and Ghinucci were conducting with the Emperor in Spain, together with the opinions of the English Ambassadors at Valladolid as to the proceedings between the Emperor and the Ambassadors sent by Francis. No one could have prophesied what would be the issue of the negotiations between the two monarchs; and in reading over the detailed accounts of the transactions in which they were engaged, it would be difficult to conjecture that they are to issue in the marriage of the French King with the Dowager of Portugal. The letters of Clerk, Bishop of Bath and Wells, from the French Court are extremely interesting; but still more interesting is the private letter sent from the same Court by Ghinucci, who had been instructed to pass that way on his journey to Spain, and inform Wolsey as far as he could of the real sentiments of Francis and the Queen-mother.

Clerk's letters are in English, but though Ghinucci was also a bishop of an English see, he was not able to write in English as intelligibly as he could in Latin. He was an abler diplomatist than his brother Bishop of Bath and Wells. Both of them were of opinion that neither Francis nor his mother showed any inclination for the marriage with the Emperor's sister, but Ghinucci expresses an opinion that the marriage with the Princess Mary was a very subordinate consideration to the release of the French King's children from captivity, and that to ensure their freedom he would marry any woman, even were she a hundred years old, or even the Emperor's mule. Wolsey knew that he could not trust to anything Francis might say, but he, as well as the Ambassadors, could tolerably well estimate the motives which were at the moment actuating the French King; and Ghinucci, after making the most of his powers of observation at the French Court, went on to Spain with the view of discovering whether there was any secret practice between Francis and the Emperor. On the 30th January, 1527, Charles thought it worth his while to write to Wolsey with his own hand, "Mons' le Cardinal, j'ay ma parfaite fiance en vous, et vous poves estre schur que tousjours me trouverez votre bon ami." Wolsey took this for what it was worth, and used all his power to prevent the impending marriage. Mr. Brewer has brought to light another autograph letter which exists in two separated and mutilated leaves in a volume of the Cotton Library. It has a seal, but no address or name of writer; but it is undoubtedly a letter from the French King to the Princess Mary, and it is not difficult to guess at the general style of its contents from the few lines that have been preserved, which are full of compliments to the King as well as to the "tres haulte et tres puissante princesse."

One curious feature in these documents is the large number of them which exist only in extracts made from the originals by Peter Vannes, under Wolsey's orders. The originals have in many cases disappeared, but we may suppose that all the important parts of these despatches have been preserved; and what is equally remarkable is that these extracts are for the most part in the Cotton Collection, very few of them having been preserved in the Record Office.

That the Queen-mother was anxious for the marriage was plain enough, as she urged Clerk that the princess might be sent over in order that there might be at least the pretence of consummation, which she thought would ensure her to the King for ever, and thus entirely prevent the marriage with the Lady Eleanor. The document which contains the proposal is very much mutilated, but it would be impossible to mistake its meaning, even if the important words "conatus ad copulam cum illa quæ est proxima pubertati, prudentia supplente ætatem" had not been supplied by a copy made previously to the mutilation, and which is printed in the Collections at the end of Fiddes's *Life of Wolsey*. The King himself thought his mother's proposal strange, but if he had a keener sense of decency than she showed, it is probable that considerations of policy and the desire for delay had no little influence in bringing him to his determination on the matter.

The treaty of perpetual peace between Francis and Henry, including the alternative marriage, as it was called, is matter of history. It is dated April 30, 1527; but the present volume contains a copious analysis of the narrative, written by Claude Dodieu, one of the Ambassadors sent to England to negotiate it, which

details every conversation held between the French Ambassadors with Wolsey and with Henry, Catharine also being present on two occasions. The journal, which, curiously enough, is in three different places dated 1525 by mistake for 1527, runs over the whole period from February 26 to May 8 of that year, and though the result of it was abortive, it wonderfully illustrates the sagacity and caution of the Cardinal of York. He probably knew that the negotiations would result in the marriage of Francis with the Emperor's sister, and it suited him that the idea should still be entertained that the princess might yet be married to one of the French King's sons, or else that the interests of France and England might be combined by an alliance between the Duke of Richmond and the daughter of Francis. One of the most remarkable facts stated in the narrative shall be given in the words of Mr. Brewer's analysis. We should be glad if we could give them as they are in the original document. But we need not say that the accuracy of the epitome is unimpeachable:—

The next day, the 7th of May, Wolsey declared that the Imperial Ambassador had come to him to thank him for the trouble he had always taken to preserve peace between his master and the King; to ask him to continue doing so; to tell him that Francis could not ask for the Princess Mary in marriage as he had promised himself to Madame Helyenor, with whom he would have consummated marriage in Spain if the Emperor had not prevented it on account of his illness; that Francis only wishes to impose upon the King; in proof of this, letters were shown from him to Charles, his wife, and Madame that the people of Spain had offered him much money and troops to fight the Turk, which he refused for the present, telling them that war could not be made without the union of all Christian princes, which he is trying to procure; he asks for Wolsey's advice thereupon; has sent power and instructions for peace, and is quite ready to conclude it; his wife expects to be confined in June, but she is so weak that the doctors fear she will die; and if so, he wishes to marry the Princess Mary, as his people urged him to marry his present wife and not the princess, as the latter was so young. He offers also Madame Helyenor's daughter to the Duke of Richmond, with a dowry of 300,000 or 400,000 ducats.—P. 1414.

The complications which arose out of the suggestion of the divorce of the King of England from the Emperor's aunt are of a later date, and we reserve an account of them for a future occasion.

(*To be continued.*)

GERMAN COOKERY AND AUSTRALIAN MEAT.*

AT a time when, in an international temple for the glorification of our nineteenth-century progress, the curious can learn cookery at sixpence per lecture, and taste the subjects of each lecture for sixpence more, it behoves every one to acquire a smattering of the art; and the high prices of coal and meat supply an additional reason for studying the means by which cooked food may be made cheaper as well as more savoury and more various. Two handy books lie on our table from the same publishers, one containing recipes for cooking Australian meat, the other descriptions of German cookery, from soups to sausages, applicable to English kitchens. There are points of contact between these two works, and good results might follow from the collateral reading of the volumes, with a view to apply to the matter of the first the manner or manners of the second. Australian meat promises to be so plentiful and cheap, and its valuable qualities are getting to be so well recognized in every class, except that lowest class to which it is the almost sole form of meat within reach, that it is of the utmost importance to know all the forms and shapes in which it can be presented at table. Already it is so appetizing through its succulence and flavour that housekeepers with hungry sons question the cheapness of food of which so much can be eaten at a sitting; and we have heard of a modern representative of the "scholasticos" or "foolish fellow" of Hierocles, who, with delightful inconsecutiveness, wished he could emigrate to the antipodes that he might feed on nothing but tinned Australian meat. The naturalization of German cookery is perhaps a less easy and certain experiment, but there is room for taste and choice as regards the adoption or rejection of parts of the system. Though its character is more solid and heavy than that of the French cuisine which is most in favour with our upper ten thousand, and which hence largely influences the fashion with the class next below them, a study of "German National Cookery" will suggest that foreign missionaries such as Urban Dubois have leavened German gastronomic taste in the last score or two of years, and that there are hints to be got out it not unworthy of a Ude, a Francatelli, or a Gouffé.

After a glance at the introduction to each of these handbooks we shall pass briefly in review some of the salient points for acceptance or avoidance, in the body of each work. It was high time that a cookery-book should be dedicated to the treatment of Australian tinned meats, when, as the writer of the first manual of the kind shows, the value of the shipments of beef and mutton has risen between the year 1866 and 1871 from a total of 321*l.* per annum to 513,186*l.* This increase of figures would seem incredible, except for its consistency with the statistics of the slaughter of sheep and oxen per week, or per half-year, by one or two representative Australian establishments. What makes the transit feasible and profitable is the chloride of calcium process, by which atmospheric air is excluded from the tin, while the germs of putrefaction are expelled by heat. All that is needed to make the imported tins alike popular and profitable is the simple observance of the self-evident proposition that to stew what has been already stewed is at once "lost labour" and "lost savour." To disprove the libel that these meats are *per se* flavourless or insipid, it is only necessary to warm them in the tins in a stewpan of boiling water, or simply to turn them out of their tins, trim off the grease and jelly, which are ready stock for soups and gravies, and eat them cold, as they are. The original cooking, short, sharp, and intense, before the meat makes its voyage, has been such as in no perceptible degree to sap its flavour; only allowance must be made in re-cooking for a process which has already reduced it to something very like rags. If this is kept in view, the boneless ness and the available weight of the meat constitute a saving which the author of the treatise before us shows in intelligible figures and illustrations to be somewhere about 5½*d.* a pound in a leg of mutton. Light-weighted tins, which we sometimes hear of, must, he avers, be the result of pure accident, as short weight would not substantially affect the profits where the prime cost is so very small; and this explanation is one which will gain credence in proportion to the independence of the anonymous author. That he is independent we infer from his nonchalance and indifference as to particular *brands*. "That company," he writes, "which sends over the best and cheapest meats will in the long run do the most business and pay the best dividend." The companies should certainly be grateful to him for the skill with which he has demonstrated the multiform uses of Australian viands.

The preface to "German Cookery" is a brief exhortation to catholicity of taste in culinary matters, and an endeavour to show how much the English lose by their ξενηλασία, or exclusiveness, as regards foreign dishes. It does not confine itself to apologies for retaining German names for German dishes, and local names for dishes in local favour, but argues the advantage, in point of excellence and variety, of novel importations which may tend to make an English dinner-table more attractive without increase of cost. And it is strong on the topic of acquired tastes. "Who ever began with liking pickles or pungent flavours of any kind? Olives, porter, claret, gamey game, mutton high, woodcocks' trails, and many other delicacies?" Indeed there are warnings already that our countrymen are beginning to shake off some prejudices as regards foreign food which we should have thought least likely to be disturbed. The newspapers tell us that snails for culinary purposes command a very large sale in the Gloucester market.

Soups and sauces are obviously matters in which German cookery and Australian meats may well have a common ground, though one class of German soups will, we suspect, be hard to naturalize amongst us. Beer soups must surely remain a German speciality. No other nation could relish a soup made of three quarts of ale, two ounces of sago, the peel of half a lemon, cloves, cinnamon, and sugar, with the addition, after it has boiled for twenty minutes, of slices of lemon and a glass of rum or brandy. We cannot conceive how palate or wit can be sharpened by such a beginning of a repast. Yet this is a more refined, less thick, creamy, and foamy beer-soup than many in this category of soup recipes, most of which remind us chiefly of the egg-flip, or rum and milk, which have their time and place, among ourselves, on a coach drive or a cold hunting morning. Nor does it seem that beer is done with when the soup is removed. Though we should look for something piquant to restore an appetite jaded by beer soups, the first *hors-d'œuvre* that we come upon (Stolzer Heinrich, p. 28) consists of sausages covered with ale in a stewpan, simmered for half an hour, by which time the ale is reduced to a brown sauce, which is thickened with more ale, wine, gravy, vinegar, lemon-peel, caraways, grated brown bread, salt, and pepper. The German cook's eels, too, are stewed in *beer*, and not in "bro," as Lord Randal's were in the Scotch ballad; and, in truth, this phase of German cookery explains the saving clause in this Cookery-book in regard to Lenten or Fast-day Soups, which, however, are a good deal better than the name would imply, and worthy the table of a not ultra-ascetic cardinal. Among the novel recipes which strike us as worth trying in the German Cookery Book are pancake soup, Pomeranian soup with duck, crayfish soup (Krebs suppe), and chestnut soup, though in this last there was no need to note that chestnuts peeled and scalded would take less time to cook. It is with purées especially, however, that a common ground is found upon which to combine the teaching of both the books before us. These represent a stock worked through a sieve into a thick paste, to be afterwards thinned with soup or broth; and whether we regard the purée itself or the broth that is to thin it, it is plain that elements will be found in the juicy meats and the jelly of the Australian tins. The advocate of these tins, however, is not unduly strong in his recommendation of this imported meat for soups, inclining rather to a combination of fresh meat with Liebig's Essence. He gives a good recipe for kangaroo soup, clear or thick, and we can answer for this game soup of the Antipodes being worth experiment. The fault of tinned kangaroo meat is that it is too highly spiced and peppered before undergoing the tinning and preserving process, though it will make delicious relishes and *hors-d'œuvres* such as patties, croustades, and the like. In mulligatawny soup, as we should expect from its excellence in curries, Australian meat forms a very serviceable ingredient, and in a couple of cheap vegetable soups (Nos. 5 and 6) its trimmings and grease are as good as anything that home use has till now put in the place of them.

The author of the Australian recipe-book has a special intro-

* *German National Cookery for English Kitchens; with Practical Descriptions of the Art of Cookery as performed in Germany.* London: Chapman & Hall. 1873.

Recipes for Cooking Australian Meat; with Directions for Preparing suitable Sauces for the same. By a Cook. London: Chapman & Hall. 1873.

duction to the sauces which he suggests as being half the battle in the naturalization of tinned meat; and he may be forgiven for making too much of the old story from the *Art of Dining* about the disguise of a pair of old kid gloves by the aid of a good sauce, for the sake of the practical counsel he gives as to the economy of using the gravy of the tins, a strong quintessence, instead of the stock which an English cook makes up from bones and trimmings. This will bear diluting; it will also on occasion repay thickening, seasoning, and flavouring. In its preparation a *sine qud non* is to simmer and not to boil; and to beware of burning or smoking the sauce. And all heed should be given to the very needful hint that the cook should not be content with following a recipe, but should also test his or her study of it by occasional tasting.

Those readers whose taste and mind are sufficiently *in patinis* may compare the brown sauce (p. 74) of the Australian "Kitchener" with the brown gravy stock (p. 47) of the German cook. Or they may assess the difference in the horse-radish sauce of each. This seems to be that, while A to the horse-radish and cream adds vinegar, chili vinegar, mustard, and pounded sugar, B, who here represents Germany, ignores the mustard, and for vinegar offers, very plausibly, the alternative of lemon juice. There is a considerable difference between the German "orange sauce" for wild duck, and the Australian for grilled meat, though we can well conceive that both are excellent. And there are some sauces—*e.g.* Holstein and Saxony sauces—of undoubted pretensions, which are of course peculiar to the German cookery-book; on the other hand, we owe to the Australian a very useful recipe for eschalot wine to be bottled down and used for flavouring sauces which do not want the acidity of eschalot vinegar (92).

Over the wide fields of fish, salads, poultry, fancy pastry, and beverages the Australian, from the very nature of the case, does not profess to follow the German. And in each of these there is much instruction and interest. A recipe for mock oysters (p. 35) strikes us as being as great a resource or shift as Scotch woodcock in its way; and that for "coated pike" (angeschlagener Hecht) (p. 39) reminds us of the device for re-dishing a saddle or shoulder of mutton, with the vacuum made by the removal of the prime slices filled up with skilfully disguised mince-meat. The hints as to salads, too, are worthy of attention, though none of them beats the old advice quoted by our Australian friend, that in dressing salads "a spendthrift should add the oil, a miser the vinegar, and a counsellor the salt." To do him only justice, he manfully runs his German competitor hard where he has common ground; giving us in pp. 51–4 croquettes, cannelons, cromeskeys, coquilles, croustades, petites bouchées, and attelettes, according as the taste may prefer the beef, mutton, or game of the Antipodes done into cones, oblongs, shells, round cases, or other morsels. On the whole, we should feel more at home amidst his provocatives to the appetite.

Among the solids of which we gain an idea from the comparison of these volumes, one might do worse than try the shepherd's pie (p. 12), the potato pie (p. 13), or the cold kangaroo pie for lunch or breakfast, to say nothing of the raised beef pie with oysters. To the second of these the nearest approach in German cookery appears to be the potato turnover (p. 156), whilst the "Strudeln," or roly-polies, which encase mince-meat of any kind (p. 191), resemble the minced beef puddings which our Australian adviser recommends in p. 17. His mutton curries and hashes, rich, richer, and richest, are all good, we will engage to say without doing more than reading the recipes; and his baked Irish stew ought to be first-rate. Of course he cannot compete with Germany in pasties, upon which the German Cookery Book is naturally very strong. Four alternative recipes are given in it for "Strasburg pâtés de foies gras," Nos. 1 and 2, in which truffles form a part abundantly fit for the *divitum mensæ*. What is more, the author brings them within the range of moderate people by showing that there is a much more economical way of going to work than buying Strasburg patties from the metropolitan provision vendors. It will induce some perhaps to buy a useful book if we refer them to p. 221 for the information. The same book will suggest a preparation of summer fruits almost wholly unknown to this country. The Kalteschaler and Triett are German substitutes for pies and tarts (the distinction being that the former are more liquid than the latter), and are served in a bowl, tureen, or glass dish (167–72). The English word cold-bowl would be an imperfect synonym; but the compound requires more or less water and wine to be added to the fruit juices.

We trust that a glance, necessarily cursory, at both these volumes will have the desired effect of recommending them to professional and amateur gastronomes, as well as to plainer and less artistic folk. There is, we are convinced, much to be learnt from the one and the other in regard to the best means of making our food supply more attractive, more various, and, above all, less expensive.

THE MILITARY STRENGTH OF RUSSIA.*

(Second Notice.)

IN a former article we briefly noticed the vast change which has come over the organization of the Russian forces since the Crimean War demonstrated the hollowness of a Reserve which has to be all but created on the alarm of war. With the exception of such men as are actually on furlough, the Russian army, excluding local troops, is now all actually embodied for active service. The cadres are maintained, in fact, effective for the whole force that may be needed for the field, and though the numbers we gave of 580,000 men which could be used in Europe are moderate as compared with popular estimates, it must be remembered that they are supplemented by an enormous mass of transport corps and other non-combatants, and by another of purely local troops of regular organization, or regulars permanently detached for local duty. And these latter categories Russia maintains to an extent far beyond the proportion kept up by other great Powers, as we shall presently see. It is our task to-day to show how this force is organized, more particularly as compared with that great model army which late events have put at the head of all military organizations.

There is no army corps in Russia in time of peace. The highest unit for all administrative and tactical purposes is the division, all divisions being kept nearly at the same strength. There are forty-seven of them in all, of which forty are known as line or army divisions, and the others are select troops, three of Guards and four of Grenadiers. One of the last, and five of the line divisions, are allotted to the Caucasus command, which may be held practically to include the whole Asiatic frontier of the Empire. This leaves, of course, forty-one divisions to garrison European Russia, or to take part in a European war. Of the other six we shall only here say that each regiment in the Caucasus command has a fourth battalion; so that the divisions of infantry are full thirty per cent. stronger than those of the European commands—an arrangement made to prepare them the better for such drafts as the Khiva expedition is now making on their numbers.

The Russian division is organized not unlike the German. It includes, like the latter, four infantry regiments, each of three battalions, and each numbering 1,000 strong when the men on furlough rejoin. This gives 12,000 for each division (usually divided into two brigades for tactical purposes), or, in all, 492,000 infantry. But to this estimate must be added the Rifle battalions, which are distributed one to each division of Guards and Grenadiers, and one to the first twenty-one divisions of line infantry. An extra one being also assigned to the Guards specially, the total number of them is thirty, and the complete strength of each is 800, giving 20,000 effectives in all, and raising the total of the infantry of the European army to 512,000 men.

The regular cavalry of Russia is moderate in numbers compared to the 80,000 sabres boasted of under the new German organization. It comprises twenty regiments of Dragoons, sixteen of Lancers, sixteen of Hussars, four of Cuirassiers, and two of Cossacks of the Guard, of which last, however, two thirds are always on furlough under a special ordinance. Of these fifty-eight regiments, four only of Dragoons do duty with the army of the Caucasus; the others form nine cavalry divisions, two called of Guards (the first division of these being made up of the Cuirassiers and Guard Cossacks), and the other seven of the line. Every regiment has four squadrons, each about 150 strong in all; so that, deducting the absent Cossack squadrons, there are maintained actually in Europe 220, containing barely 33,000 officers and men. There is no brigade organization for the Russian cavalry, which is intended either to act in the mass of a division, or to be distributed at need among the infantry.

Each infantry division has attached to it a brigade of field artillery bearing the same number, and, like the infantry, those of the Caucasus or Asiatic force are stronger by a third than the others, which contain three batteries of eight guns each. There are, besides these, eight brigades of horse artillery; seven, of course, attached to the seven cavalry divisions of the line, and the eighth a Guard brigade of four batteries, which forms a command independent—from long tradition rather than for proper tactical considerations—of the Guard cavalry. The seven horse brigades of the line have but two batteries each, and so the whole make up eighteen; whilst the field artillery proper—exclusive of the Asiatic—has 123. When all the men are called in, the battery may be taken at 200 strong. So that the grand total of the European artillery amounts to 28,000 men, manning 1,128 guns.

The Engineers, which, as in Germany, include the pontoon trains, are distributed into battalions of sappers and half-battalions of pontonniers, the former numbering eleven, each 1,000 strong, and the latter six, at 400 only. But two battalions of sappers must be deducted, as belonging to the army of the Caucasus. The others are distributed in four brigades, one of which forms part of the Guard; and the total is, of course, 11,400 field engineers to be added to the other arms.

It seems, then, from the estimates here followed, and attributed to Colonel Von Verdy, that the force available for the European operations of Russia is thus divided as to its arms:—Infantry, 492,000; riflemen, 20,000; cavalry, 33,000; artillery, 28,000; and engineers, 11,000; making the total of rather over 580,000 in all, with 1,128 guns. But then these numbers altogether exclude the formidable force on the Asiatic frontier, which, if similarly reckoned up, appears to muster 103,000 combatants, with 176 guns. The actual total of the regular forces maintained by Russia, exclusive of non-combatants and local troops, cannot therefore be put very much under 700,000 when the regiments are on a war footing. Its very disproportionate supply of cavalry has always been understood to be

---

* *The Armed Strength of Russia.* Translated from the German (Austrian) by the Topographical Department of the War Office. 1873.
Die Heeresmacht Russlands. Berlin: Duncker.

of a purpose, it being intended, in case of war, to call up Cossacks to supply the deficiency. But, not to mention the great inferiority of these children of the desert for any warlike purpose beyond the mere harassing of a flying or careless enemy, it is well remarked by the Prussian critic that the suddenness and decisiveness of modern war render dependence on any such force unsafe; since the struggle might be over before any great proportion of the 50,000 rudely estimated as available could be got to the proper points. In artillery, on the other hand, the Russian army is by no means lacking, according to moderate views, there being actually more than two guns to every thousand men of the infantry and cavalry; and although this proportion will far from satisfy certain critics amongst ourselves, it is usually accepted by German authority as a fair one for general needs. It certainly strikes the author of *Die Heeresmacht* as a very sufficient ratio compared to that of the cavalry.

The local troops form a very important element in Russian organization, fulfilling as they do the separate functions of supplying garrisons, covering frontiers, and aiding in training the regulars, and thus leaving the whole of the active army proper available for war. Thus the European frontier of Russia is garrisoned by 30,000 special troops of this class, of whom 6,000 are artillerymen, and the rest formed into frontier battalions. On the Asiatic and Siberian sides no less than forty-six local battalions are maintained, with the double object of watching the districts which form their permanent quarters, and of reinforcing at need the army of the Caucasus. It is believed that these battalions are on a reduced footing of about 600 men each, giving a total of 28,000 soldiers. Whether this be so or not, they must be presumed to be efficient, for the Khiva columns seem to be in large part composed of detachments from them. They are not to be confounded with the so-called "Government battalions," of very varying strength, which number sixty-eight in all, and the real objects of which are to support the local authorities and represent the central power of the Empire at all important places, but more especially at those to which more regular troops are not usually assigned. And, distinct again from these last, and still more difficult to estimate, are the instructional or depôt battalions, squadrons, and batteries, which undertake the first training of the officer, and are maintained as models of exercising from which he can carry to his regiment a proper knowledge of the instruction of the recruits afterwards to be placed under him.

Lastly, we must notice briefly as a recognized national element of strength, the so-called Irregular army, formed chiefly of Cossack horsemen. They are reckoned, as a paper force, at 144 regiments of cavalry, all told, with an uncertain number of battalions of untrained infantry. Though largely used in the Polish struggle, the Prussian critic does not believe that they would add more than 10,000 really effective troopers to the army for a European conflict, or that they could in any way form a very important element in it. "The enemies of Russia," he says, "on the side of Europe, will reckon on having chiefly to do with her regular troops; and the fear of Europe being again overrun, as though these were the days of Tamerlane, with half-savage Asiatic hordes, is one altogether unfounded." We confess to being altogether of the same opinion, and we may add that a study of the exploits of the Russian armies in the Napoleonic wars has long since brought us to the conviction that the Cossacks played a part—except when actually in pursuit of a fugitive foe—which was much more dramatically effective than materially important to the operations.

In comparing the armies of Germany and Russia thus far, it will be observed that the great relative weakness of the latter in cavalry, and her large use of regular local troops as part of her peace establishment, form the most striking points of difference. But when we pass to the question of organization viewed strictly it will be found that the principles are essentially opposed. In Russia no exact attempt has as yet been made to imitate the provincial corps arrangements, which have enabled the younger Empire to decentralize her army to an extent never before known without any apparent loss of its efficiency as a whole. A certain number of divisions are indeed allotted to each government; but they vary from not less than six in that of St. Petersburg (in which of course the Guards are included), to one in certain others of the various governments which make up the Empire. The divisions are under the military chief of the province, who may be, as it happens, its civil governor-general or not; but he has by no means the complete power entrusted to the "Commanding General"—as he is emphatically termed—of the Prussian corps; and most of the important questions are passed on, as they might be with us, to the central War Office, the Emperor being not merely in theory, like his uncle, but in fact, the head of his own troops. This principle of centralisation is not however applied strictly to the Caucasus forces, for the very sufficient reason that their distance, and their constant state of preparation for actual warfare, make it not merely unadvisable, but well nigh impossible, to carry it out in their case.

The recruiting system also, like the organization, is at once looser and yet more centralized than that of Germany. Each division, indeed, is usually filled up from the government to which it is for the time being assigned. But there can hardly be said to be a strict rule in this matter; and it is clear that the men on furlough, if suddenly called up, are not held liable to go to their former regiments, but only to enrol themselves at the nearest headquarters of a division or chief place of a government. As a large part of the population is almost cosmopolitan in its tongue and unsettled in its habits, there seems no security provided that the divisions should be easily filled up to war strength at the word, some being probably left far below it, whilst in other quarters there might be a large excess of trained soldiers coming in.

It may be said that all this is but the view of outside critics, and that Russians, if they chose to answer it, could give a very different report. But the criticisms are shrewdly sustained by the well-known decision of the Military Commission in favour of the introduction of the German system, lately made even at the risk of driving General Miliutin out of office. And to this it may be added that those experts who have studied the new Russian law of military service, so far as yet known, are aware that it is singularly loose in its application of the principle of universal liability, admitting great numbers of total exemptions, and allowing a still larger proportion of the youth to escape with a very partial training.

Few people would choose, we imagine, to offer confident predictions as to the results of that possible struggle between the two great military empires which in each is so confidently expected that Imperial embraces will not affect the belief that it is but deferred, not prevented, by such meetings as those of St. Petersburg. But we think those who have followed us in our survey will see good reason to believe with Prince Paskievitch that Russia, despite her great strength and colossal size, may yet have good cause to dread "a new invasion conducted more prudently than that of Napoleon," an invasion, too, which, should it come, will be made with intent hardly less hostile to her power than that of the great overthrower of States of sixty years since.

MINOR POETS.*

WE have before this had the pleasure of calling the attention of our readers to the merits of Mr. Wade Robinson's poems. Unlike most of the minor poets who come before us, he not only does not write nonsense, but he writes sound sense. But sound sense alone, pleasant though it is to find it in modern poetry, does not make a poet. Mr. Robinson, however, adds to it no small amount of poetic imagination, a versification that is correct and often melodious, and a considerable mastery over our language. Our language, he might have learnt by this time, is English and not Saxon. Should his poems, as we hope they may, see a second edition, let him change the title of the poem he calls the "Saxon Bible." No doubt he wants to mark off that English in which the Bible is written, that "home-spun of Saxon" as he calls it, from the English in which the *Daily Telegraph* is written. To allow that it is the latter that is English, and the former that is Saxon, will be to give up the battle at once. We shall prefer, when we want to make a distinction, to talk of English and *Telegraph* English. It is English, then, that Mr. Robinson writes, and writes with a certain amount of vigour that is rarely found in one of the so-called religious poets. There are too many of this class who think that their piety shall cover their feebleness, and that with the stamp of orthodoxy their brass counters shall pass as standard gold. His poems indeed are not wholly religious, but most of them bear the signs of a man who has suffered deeply, and has found repose in revealed religion. The short piece which he entitles "A Ballad of Love," may be taken as a good specimen of his style and of his method of treating his subject. He is describing the perfect love of a husband and wife, and thus writes:—

> And always she was there to cast on everything a splendour,
> To fold him with that constant love so strong because so tender,
> To grow with every passing year more beautiful before him,
> To sweetly be adored, and still more sweetly to adore him.
>
> And dwelling with that woman there, the husband did discover
> How weakly he had dreamt of love when he was still a lover—
> How one rich woman, like a flower that spends its life unfolding,
> Has yet a hidden beauty left when men are done beholding.

The wife was "touched at last by that stern law which mocks at love's resistance," and, dying, "left him in their pleasant home alone and broken-hearted." The husband passes slowly from "the blank and dreary sense of utter desolation" to a firm belief in "a great hereafter." He not only finds comfort for himself, but has comfort to spare for others. In the poet's words:—

> Thereafter—if I still should tell a story worth the telling—
> So freely in this old man's heart the fount of peace was welling,
> That forth he went to seek those eyes whose light was quenched in sorrow,
> And tell how his own night had found so bright and calm a morrow.

Mr. Robinson would do well to change a word now and then. In the poem from which we have just quoted our taste is offended when we read how "baffled winter screamed" about a garden,

* *Songs in God's World.* By Wade Robinson, Author of "Loveland," &c. London: Longmans & Co. 1872.

Le Circe, and other Poems. With Notes. By John Appleby, Compiler of "Stage and Literary Celebrities;" Author of "Serial Papers," &c. London: Provost & Co. 1873.

Lyrics of a Life-time. By Samuel Smith, Woodberry Down. With Illustrations by William Henry Prior. London: Chapman & Hall. 1873.

Miscellaneous Trifles. London: Provost & Co. 1873.

The Lonely Guiding Star, and other Poems, Miscellaneous and Dramatic. By William D. S. Alexander. London: Sampson Low & Co. 1873.

Bubbles Light as Air. By Charles Wilkinson. London: John Camden Hotten. 1873.

Ich Dien. London: Moxon & Co.

The Cairns of Iona, and other Poems. By Alexie Bond. Dublin: George Herbert. London: Simpkin, Marshall, & Co. 1873.

Cæsar in Britain. By Thomas Kentish. London: Basil Montagu Pickering. 1873.

Parables and Tales. By Thomas Gordon Hake, Author of "Madeline," &c. With Illustrations by Arthur Hughes. London: Chapman & Hall.

and the last verse of one of his best poems is sadly spoilt by the word "glutting" being dragged into rhyme with shutting. We must not end, however, with finding fault with a poet who has so much in him that we can heartily admire.

Mr. Appleby and Mr. Samuel Smith have much in common, and, except that Mr. Smith embellishes his poems with a picture of "Railway Construction," and Mr. Appleby embellishes his with a picture of himself, there is nothing to choose between them. Both write utter nonsense, but Mr. Smith's nonsense is perhaps somewhat the more wearisome of the two, as there is an attempt at humour about it. Lest his jokes should be missed, he has, it would seem, remembered how Swift says:—

> In modern wit all printed trash is
> Set off with numerous breaks and dashes.

We must do him the justice to admit that not all his "printed trash" is thus set off. The following lines, if they have nothing else to commend them, are at all events innocent of italics:—

> And e'en the goods from damage to protect,
> Well tarred tarpaulin was securely spread,
> (With carrier's name and destination deck'd),
> Above the trucks that bore them from the shed.

Mr. Appleby possesses in the highest degree that we have ever known an absence of all those qualities which are generally supposed to go to make up the poet. He cannot even write grammatically, rhyme correctly, or use his fingers with accuracy in keeping his lines of the right number of syllables. He knows nothing of melody or metre, and, in short, would be utterly intolerable even if he were to take to writing hymns or congratulatory poems. He has in one matter, however, set our modern poets an example which they would do well to follow. He has annotated his own poems and cleared away certain difficulties by explanatory notes. For instance, he has written some verses on that "great writing star" Charles Dickens. With a view, we suppose, chiefly to posterity, who, while it preserves the memory of Mr. Appleby, may yet forget Mr. Dickens, he tells us

> Charles Dickens was a distinguished novelist, born at Portsmouth 1812, died June 9, 1870, at Gadshill, Rochester, Kent, and interred at Westminster Abbey. In life courted and admired, his works read by all classes throughout the civilized world, and whose death was universally lamented.

The same kind foresight for future generations is shown in the short history he gives of the life of Napoleon III., and of the illness of the Prince of Wales. He has, however, done his work but carelessly; for, though he writes a poem on Shakspeare, he has forgotten to tell us who Shakspeare was. Such lines as the following, however, will in days to come rouse the curiosity of some antiquary and set him to learn something of this Shakspeare:—

> O'er three hundred years have been and gone,
> Since thou! immortal bard of Stratford-Avon;
> Thou chief, mighty genius, now laying in dust,
> But thy likeness—is now before me in bust.

Mr. Appleby makes a fierce onslaught on "the ignoramuses who rail and rant." As it is said that no man is so miserable but that if he looked he would find some one still more miserable, so we must believe that Mr. Appleby cannot be so great a ranter but that if he looked he might yet discover a greater ranter. We should be curious, however, to know who the ignoramuses can be on whom the writer of such lines as the following from the poem called "A Satanic Victim" looks down with contempt:—

> On a burning eminence he stood
> With fiery foot upon the victim caught,
> Firm on his neck with pleasure fraught;
> Said he, "This worm he hath shed blood."
>
> Then a horrid and demoniac laugh
> Made the halls of fire loud resound,
> While they the worm so tightly bound;
> He shrieking awful in the hellish gaff.

By the way, it would be well if in a future edition he were in a note to tell us why his poem on "a repenting and sorrowful Magdalen" is called "Le Circo's Story."

Whether the worm of Mr. Appleby's muse belongs to the same species as the worm of the author of *Miscellaneous Trifles* would be a question that falls rather within the province of the naturalist than that of the critic. We should not pretend, therefore, to decide on a matter that does not properly belong to us here; but, quoting both passages, we content ourselves with calling the attention of the scientific world to an inquiry that is full of interest. The second worm occurs in the following extract from a poem on "the fierce Pizarro, perfidious as pitiless":—

> Pizarro fell! No tender tear
> Dropped on his mangled form;
> The condor snuffed it from afar,
> And snatched it from the worm.

It is not wonderful that since this memorable event in Peru's "faithful records"

> Pizarro's ever-hateful name
> Conspicuous hath stood.

Mr. Alexander among his other poems publishes a tragedy in five acts, which he tells us "was written with a view to the stage." He complains of "the extraordinary and almost insurmountable difficulties that are thrown by managers in the way of aspirants for dramatic honours." The managers of the present day, we dare say, are as likely to fail in discernment as their predecessors often have failed before them, and if a Goldsmith should write a *Good-Natured Man*, a Garrick might be blind to its merits. Nevertheless, in the present case we think the managers are right; for though Mr. Alexander writes with a certain correctness, correctness alone will not keep an audience from sleep or a manager from the Bankruptcy Court. "The one most successful dramatist of the day," to whose judgment he submitted his tragedy, was certainly right in condemning it "as an *acting* play," though we cannot go with him in giving "a flattering opinion as regards the poetry of the piece." Unlike most minor poets, Mr. Alexander is correct in his versification and rhymes, and not extravagant in his sentiments. But even a modern audience could scarcely enjoy such lines as the following:—

> *Haeffiz.* An army will set forth to quell the slaves
> Ere many days can pass.
> *Murad.* The chief command?—
> *Haeffiz.* There is no chief command. It is from this
> My deep displeasure rises, as does that
> Of each right-thinking man.
> *Murad.* Art thou not named?
> *Haeffiz.* I am.
> *Murad.* Thus far did I anticipate
> What scarce could fail to be.

Mr. Wilkinson may in an affected disparagement call his poems *Bubbles Light as Air*. We do not know what may be the specific gravity of the *crassus aer* of the Boeotians, but there is no English air—not even that of a November fog in London—that would not be insulted if likened to these Bubbles. The poet, in some verses that he calls "Wayward Fancy," tells us, "I fancy words that sound the mystic." The following is a fair specimen of his mysticism:—

> It is the witching time of night,
> Another day is past,
> The cat is purring in the light,
> The gas is burning fast.
>
> The weakly cinders in the grate
> Give out no bluey reek,
> The yellow tirtle o'er my pate
> Has hushed his noisy cheek.

The author of *Ich Dien* addresses to the Prince of Wales, in the form of a poem, a somewhat long and dull sermon, taking as his text, to quote his own words and his own English, "the noble motto thou hast heired." He reminds the Prince of the high position he holds, and uses the following scientific illustration to bring home to him the duty of giving drink to the thirsty:—

> To proffer food
> While water ye withhold, is labour lost.
> Th' electric currents (moisture absent) lie
> Imprisoned and quiescent. Still remains
> The food intact, and still the hungry crave.

He goes on to remind him that "thrice blest is he who takes the stranger in." Whether he is referring to the distinguished strangers who occasionally visit this country and to their reception in Buckingham Palace is not made so clear as might be wished.

Miss Bond, taking advantage of the Thanksgiving Day, also gives the Prince good advice, and urges him "to ride, O Prince, to grander life." In her poem on this interesting occasion she asks wherefore

> Cheer the millions, near and far?

Her explanation of this cheering is certainly somewhat vague, though perhaps it only makes that call on the imagination of the reader which is a characteristic of good poetry. The answer is—

> Some one goes by Temple Bar.

It was commonly reported at the time that one of the high City functionaries at Temple Bar appropriated to himself the cheers with which the Prince was welcomed. The indefiniteness of the poetess may perhaps help to account for the confusion which existed in his mind.

Mr. Kentish has performed a feat scarcely inferior to that of the hero whom he sings, for while Cæsar reached Britain, Mr. Kentish has reached a second edition. Flushed with success he meditates further conquests and in fresh fields. He sings in the preface to his second edition:—

> However, if it better please the critic
> My muse, henceforward, as her wings grow stronger,
> Regardful of his comments analytic,
> Shall mount in metre an iambus longer.

We do not remember very well the comments that we passed on Mr. Kentish's muse. If he will listen to one more comment, which shall in the strictest sense of the word be analytic, we would advise him, instead of lengthening his measure by a single iambus, to count carefully on his fingers the number of feet of which his verse is composed, and to have it for the future exactly that number of feet shorter.

How far Dr. Hake's *Parables and Tales* are a new publication we do not know. One or two of them we have certainly read before in his earlier work, and read with pleasure. We are glad to see them again, and to see them as they now appear, for not only have they considerable merits of their own, but also they are admirably illustrated by Mr. Arthur Hughes. There is a certain pleasant harmony between the poet and the artist, though the poet would have been perhaps more fitly illustrated by one who belonged to the earlier and harder school of the Pre-Raffaellites, than by one who is gifted with so soft and gentle a touch as Mr. Hughes. The most charming poem, as also the most charming illustration, is that of "The Lily of the Valley," which, by the way, we do not remember to have seen before. The following verse is very pretty in itself, but,

looked at with the accompanying illustration, its beauty is more than doubled:—

Not yet to her was Nature's age
In gnarled and hollow shapes revealed;
The buds and leaflets stamped her page,
And all that Death could say concealed.
To gnarled and hollow Nature cold,
She had not caught the sense of old.

We must find space for one more quotation:—

Again through brake and bush she flew;
Beyond the wood there lay the field;
Though unknown paths broke on her view,
To childish fears she would not yield,
But looked at heaven and saw its scope,
Taught by her mother where was hope.

It is a pity that the poet should have afterwards put the last two verses into the little child's mouth, and made her say,

I looked at heaven and saw its scope,
Taught by my mother where was hope.

What was natural enough when said of the child becomes most unnatural when said by the child.

AMERICAN LITERATURE.

THE Report of the Secretary of the Treasury * presents some points of signal contrast, and some of interesting comparison, with our own financial system. It appears, for example, that between May 1869 and June 30, 1872, there was purchased on behalf of the Treasury an amount of stock exceeding in nominal value 54,000,000*l.* sterling, at a cost in gold of about 51,000,000*l.*, prices in gold ranging from about 82¼ to par. It appears, again, that the revenues of the Federal Government average about sixty millions sterling, or somewhat less, per annum, affording a surplus of from six to eight millions available for the redemption of debt. Of the revenue a little less than two-thirds (say, 35,000,000*l.* to 36,000,000*l.*) is raised by Customs duties under a highly protective tariff; between 17,000,000*l.* and 18,000,000*l.* is produced by the various classes of taxes, direct and indirect, lumped together under the head of Internal Revenue; while of the remaining sources of revenue, the tax on banks is the only one that produces more than half a million sterling. The large remissions of taxation rendered possible by the elasticity of British revenue and the parsimony of Liberal Administrations sink into insignificance before the gigantic figures of American financiers, showing a reduction since the war of some 50,000,000*l.* of taxation, not very unequally divided between Customs and Internal Revenue. When he passes from finance to commerce, Mr. Boutwell's tone is by no means so triumphant, and presents a contrast quite as remarkable, though in an opposite direction, with the glowing congratulations of English statesmen over the ever-swelling trade of the United Kingdom. Under a tariff expressly constructed to develop native resources and encourage native industry, the trade of America appears to languish, and an important part of it to pass into foreign hands. The imports and exports of the States, exclusive of the precious metals, amount to nearly two hundred millions sterling; and little more than a fourth of this vast traffic is carried on in American bottoms. At first this falling off of native shipping was ascribed to the war, and to the perfidious policy of Great Britain in fitting out for the Confederates cruisers that drove American shipping to take refuge under the British flag. But this delusion has been effectually dispelled by the course of events since the close of the struggle. In 1864 the proportion of traffic carried on in American vessels was 46 per cent.; in 1868, when the effects of the war had passed away, it was 44; since that time it has dwindled rapidly to 38 in 1871, and to 28½ in 1872. At one time the whole mischief was ascribed to the heavy taxation of foreign articles used in shipbuilding, which certainly would of itself have made that industry almost impossible; but Congress has granted drawbacks on such articles, and still the trade continues to languish and to wane. Mr. Boutwell is not persuaded by this result that the policy of Protection is a mistake. On the contrary, he is disposed to extend it, and to revive the mercantile marine of the United States by bounties given to encourage the establishment of lines of American steamers, especially in the Pacific; he hopes thus to divert the freights of American goods into American vessels by, in plain words, paying a portion of the freights out of the public purse, and lightening the cost of shipping under the American flag at the expense of the American taxpayer. He is not quite true to the Protectionist theory, for he recognizes the soundness in terms of that Free-trade logic which proves that a trade encouraged by differential duties is simply subsidised at the expense of the consumer, and carried on at a loss to the nation. But he argues that industries which may be quite capable of holding their own and adding largely to the national wealth in their adult state, require protection in their earlier years; and that America, having at home the means of producing nearly everything she can require, will do well to foster a variety of trades which at first cannot resist foreign competition, with a view to rendering herself at no distant period the producer of those articles which she at present imports, and pays for with her agricultural produce. With a similar economic perversity, he compares the amounts of imports and exports; and, finding a slight excess on the former side, complains of a "balance against" the States, forgetting, it would seem, that the meaning of that phrase in the language of the mercantile theory was a balance that tended to the export of gold and silver, whereas America is, as he himself admits, naturally and properly an exporter of the precious metals. When these exports, and those of American bonds, come to be added to the credit side of the account, the balance is hardly sufficient to represent the profit realized on exports, which must always figure in the shape of an excess of imports, if both are valued at the American port. In regard to the currency his views may not be open to much objection; but he does not appear fully to recognise the evils of an inconvertible currency, and particularly the danger of such "expansions" thereof as he recommends for the purpose of "moving the crops" in the summer and autumn. In the case of convertible paper, such a temporary expansion is at once corrected when the temporary need is over; but the tendency of every increase of an inconvertible currency is to raise prices, and thereby to render permanent the demand for the very increase that has caused the mischief. It is something, however, that Mr. Boutwell is alive to the necessity of bringing back the paper money to a metallic standard, and seems to acknowledge that this can only be done by contraction.

The Report of the Commissioner of Internal Revenue * contains comparatively few points of interest. Among these are the amounts raised by taxes on spirits and tobacco respectively—about nine and three and a half millions—while "fermented liquors" return less than a million and a half. The Comptroller of the Currency † dwells chiefly on the failure of a legislative attempt to apportion the circulation of United States notes through the National Banks according to a scheme based on the population and wealth of the different States; and, showing that the North-Eastern States have got more than their share, he suggests the perilous expedient of a further issue to redress the balance.

The *United States Register or Bluebook* ‡ is a publication somewhat of the nature of our own official or statistical almanacs. It contains a list of the principal departments of the Union, with the chief officers of each; an Army and Navy List; an abridgment of the most important population statistics of the Census of 1870; a record of the votes at the Presidential elections of 1872 and 1868; and, in short, just that kind of practical information which a journalist or an official may need to lay his hand upon at any moment half a dozen times a day, and is therefore glad to have at hand in a publication of this kind.

A reprint of the papers which were written by the principal authors of the Constitution of 1787, while their handiwork was undergoing sharp and eager discussion in all quarters prior to the decisive popular vote, published in three or four of the principal New York journals alternately, and afterwards so famous when collected in a single volume under the title of the *Federalist* §, is even now a matter of some literary interest. The present edition has a tolerably good index, and a comparison of the different authorities respecting the authorship of the several letters, among whom there is a general agreement. It is plain that the great majority of the letters were written by Alexander Hamilton, most of the remainder by Madison, and some by him and Hamilton in conjunction; while six or seven are ascribed to Chief Justice Jay. The *Federalist* is interesting, both in an historical and a political light, and is, in fact, the most important political treatise ever published in America. A thorough study of its pages is essential to anything like a just comprehension of the Constitution, or of the subsequent controversies which have turned upon constitutional issues, as well as to an understanding of the early history of the Union. Written by the chief of that party which prevailed in the formation of the new system, and intended to vindicate it against the attacks of the Opposition, it throws a light not to be obtained from any other source on two most significant questions—What was the original meaning of the "fundamental compact" in the minds of those who drew it up? and in what sense was it accepted by the States? No man had a larger share in framing the Constitution than Hamilton. It was not, indeed, what he would have made it had he been untrammelled by his colleagues; for his own views were almost monarchical, and were certainly in favour of that consolidation which was the great dread of the States, and which the framers of the Constitution were compelled studiously to avoid. The suspicion—arising partly perhaps from the knowledge of his tendencies—that the new Union would supersede the independence and absorb the sovereignty of the several States was the chief obstacle to the adoption of the plan of the Conven-

‡ *United States Register or Bluebook* for 1873. Containing the Names of the Principal Civil Officers of the Federal Government; Army and Navy List, &c.; together with Authentic Political and Statistical Information relating to the separate States and Territories, and other portions of the Continent of America. Also the Official Census of the United States, including a Monetary Directory for the cities of New York and Philadelphia. Philadelphia: J. Disturnell. London: Sampson Low & Co.

§ *University Edition: the Federalist.* A collection of Essays, written in favour of the New Constitution, as agreed upon by the Federal Convention, September 17, 1787. Reprinted from the Original Text. Under the Editorial Supervision of Henry B. Dawson. New York: Scribner, Armstrong, & Co. London: Sampson Low & Co. 1873.

tion; and it was to allay this suspicion that Hamilton and his fellow-writers addressed themselves. Having this object, they would of course be careful not to exaggerate the Federal power as created by the Convention; yet, being anxious above all things to maintain that power at the highest possible standard, they certainly would not allow any depreciation of its constitutional authority to appear in their argument. Hence the work may be taken as a very fair exposition of the Constitution as it affected the relative position of the Union and the States; and in this light it is interesting to note the wide difference between the tone of the old Federalists and that of the party which of late years, in order to condemn secession and to magnify the power which was virtually at its own disposal, has undertaken to assert ultra-Federal doctrines. That the States were, when the Federalists wrote, as fully sovereign and independent communities as any in the world, they neither affirm nor deny; they assume it as the basis of all their arguments, and their object is to show that the States would not part with this character, or with any sovereign powers compatible with the existence of a Government representing them all in the face of foreign Powers, and capable of performing the functions indispensably necessary to the maintenance of union among them. That the allegiance of every citizen was primarily due to his State is also assumed throughout; and several arguments are employed to prove elaborately that the citizen would always prefer his State allegiance to his obedience to the Federal Government, should their claims come into conflict. The general tenor of the reasoning is that the former Union or Confederation, under which the Federal authority had to deal only with the States, and was dependent on them for the execution of its commands—under which, for example, it could levy direct taxes only by calling on the States to make certain proportionate contributions to its treasury, and could levy troops only by requiring each State to furnish its proper quota of men—was inadequate to the maintenance of national credit and of general safety; that, if the Union was to subsist, it must be allowed to have, within the sphere of its functions, direct authority over citizens as well as over States, inasmuch as no coercion of the latter was possible, save by means of open war; that the powers entrusted to the Federal Government were not greater than were absolutely essential to the performance of its functions; and that they could never be used, practically, for the oppression of the States or the curtailment of their sovereign authority. The case which actually occurred—that one portion of the States should use their supremacy in the Federal Government for the purpose of coercing the remainder, and thus drive the latter to resist by force—never occurred to these writers; and, in studying their arguments, we are perpetually reminded of their fallacy by the recollection that this was the form which the danger actually took, and that all these reasonings fail to show any security against it. The elaborate argument addressed to prove the inconvenience of the coexistence of several independent Powers within the territory of the States was as applicable in 1861 as in 1787, and had no doubt some weight in inspiring the North with a determination never to allow the division of the Union to entail upon it the curse of frontier lines, internal Custom-houses, and standing armies. But, as a general rule, the impression made by the perusal of this work is a melancholy one; the reader being constantly reminded that the very dangers apprehended by many statesmen of Virginia and the South from the Constitution of 1787 did actually come upon them, in spite of all the securities pointed out, and honestly believed to be sufficient, by the authors of the *Federalist*.

We have received two volumes of somewhat similar purpose and character—the *Science Record* *, edited by Mr. A. Beach, and the *Year-Book of Nature and Popular Science* †, by Dr. J. C. Draper. The former we have noticed on previous occasions; we may therefore briefly say that its record of the inventions, discoveries, and scientific discussions of the last year is divided first under several general heads, according to subjects, and then distributed into paragraphs with appropriate headings, each describing some single new process of manufacture, new scientific discovery, or supposed discovery, or question of interest; a number of abridgments of papers on this class of topics, from the records of different societies or the communications of individual inventors and discoverers, adding materially to the value and interest of the work. The Year-book is similarly arranged under general heads, with an excellent index referring to each separate fact, theory, or incident, and is on the whole rather more devoted to science, physical and social, and rather less to practical inventions, than the former. Both are useful and convenient works of reference; the more so that we know of no exact parallel to them among English periodicals.

Upon our monthly list are two important works on insanity, the one legal, the other medical, as regards their authorship and point of view, but each crossing at many points the line pursued by the other. Dr. Ray's *Contributions to Mental Pathology* ‡ discuss at some length the judicial treatment of insanity in civil and criminal cases, and the difficulties interposed by the law in the proper treatment of patients suffering from mental disease, as well as a number of particular cases of insanity memorable on account of their legal consequences or of the station of the sufferers—the case of George III. being among the latter. As a physician, regarding matters from the professional point of view, Dr. Ray complains strongly of the distrust shown by judges and juries of the evidence of experts in lunacy cases, and though he allows that experts do frequently and glaringly contradict each other, he cannot see that this justifies suspicion of the value of their statements. Nor does he much regard the fact that, like other professional men, these experts are apt to look at everything in the light of their own experience, and, being chiefly familiar with eccentricity as an accompaniment of madness, to believe that all oddity is a proof of unsound mind. In like manner, he argues against the requirement of a judicial inquiry previously to the confinement of a patient, as being dangerous to his health; he fails to appreciate the peril of an abuse of any arbitrary power of confinement by interested relations and dishonest practitioners. One of the most curious passages of his work incidentally confirms in a striking manner the statement of a former patient, whose book was reviewed in our columns, that a keen and eager longing for home on the part of a convalescent is regarded by the physicians of asylums as evidence of lingering lunacy. His criticisms of the definitions of English and American law are, from the standpoint of medical experience, just enough; but his professional prejudices are so strong, and his tendency to neglect the other side of all questions in which he is interested is so marked, as to inspire considerable distrust of the soundness of his judgment on practical matters. Dr. Wharton's *Treatise on Mental Unsoundness* * deals with the legal definitions and consequences of insanity, and maintains doctrines—such as that of "partial responsibility"—which are by no means generally accepted, as well as many which, though forming undoubtedly a part of the law of the subject, are reprobated by physicians, and doubtfully regarded by many sound and independent lawyers on the Bench. The legal aspects of the whole subject are fully discussed in this volume, which is, for America at least, one of the standard works upon this branch of law.

A Report on the Law and Practice of Quarantine † on the Southern Coasts of the United States contains a good deal of curious and conflicting evidence respecting the efficacy of the means commonly employed to exclude contagion by physical precautions. Whether it be possible or not to establish a blockade against disease must of course depend primarily upon the mode in which the germs of disease are conveyed, and thus involves the whole question of the nature of contagion, the character of contagious diseases, and their mode of propagation—matters upon which physicians of the highest authority seem to be not unequally divided. Till they are agreed, it seems hopeless to ask those who are threatened by contagion to give up the precautions which, on the old theory, are most effective against it; and on this ground, if not on any more positive, the Report upholds the general system, while carefully discussing the periods, duration, and machinery of quarantine in general, and in particular instances. The scourge against which the Southern States are obliged to guard is of course the yellow fever, which, though it is sometimes said to be native to New Orleans, and certainly finds favourable conditions there, is considered by Southerners at any rate to be generally a foreign importation, and to have its especial habitat in the West Indies and on the coasts of Central and South America.

A detailed "History of Short-Horn Cattle ‡," the origin of the race, their supposed affinities, and the breeds in which their peculiar virtues are most highly developed, may be very valuable to breeders and agriculturists, but can hardly command the attention of the general reader.

Three clever volumes of fugitive papers, originally bearing the pseudonym of Frederic Ingham, are now published with the real name of the author, Edward E. Hale. The *Ingham Papers* § consist chiefly of humorous sketches of, possible or impossible adventures, not wholly unworthy of the author of that wild and wonderful absurdity, "The Brick Moon," which, in remarking on a previous collection, we recommended to the notice of our readers. *If, Yes, and Perhaps* ‖ derives its title apparently from two or three pieces of imaginary history, as a supposed meeting of Homer and David, of Paul and Nero, &c. But the most original

Hale, Author of "If, Yes, and Perhaps." Boston: Fields, Osgood, & Co. London: Trübner & Co. 1869.

‖ *If, Yes, and Perhaps: Four Possibilities and Six Exaggerations, with some Bits of Fact.* By Edward E. Hale. Boston: Osgood & Co. London: Trübner & Co. 1873.

and striking paper in the collection is the story of "The Man without a Country," a fellow-conspirator of Burr, sentenced, in accordance with his own rash imprecation, "never to hear of the United States again." There are now some millions of involuntary citizens on whom the pathos and the moral of the tale will fall very dead indeed. *Sybaris* * contains a series of sketches of communities real and imaginary, intended apparently to contrast real and ideal society, and discussing the means of providing suburban houses for the working classes. Mrs. Stowe's *Palmetto Leaves* † is another collection, with less humour and more pretension to serious purpose.

The Medical and Surgical History of the Rebellion, Part I. ‡, is published in two enormous quarto volumes, the surgical volume chiefly filled with "cases," the medical with statistical tables, showing the mortality and sickness in different places and at different times, and the comparative loss by different classes of disease. The subject as well as the size of the work puts it beyond the scope of the general reader's studies; and even professional men can rarely have leisure to study a record so ponderous. The introduction, with a careful abridgment of the tables and a judicious selection from the cases, might, if published separately, be more useful and more popular.

FETTES COLLEGE, COMELY BANK, EDINBURGH.

Head-Master.

ALEXANDER W. POTTS, M.A., late Fellow of St. John's College, Cambridge, and some time one of the Assistant Masters of Rugby School.

SCHOLARSHIPS.

Two Scholarships, each of the annual value of £40, and tenable during residence at the College, will be open to Public Competition in July 1873.

The Examination will be open to any Boys (not already on the Foundation), whether Members of the College or not, between Eleven and Fourteen years of age. Allowance will be made for age, and sound elementary training will be considered very important.

The Candidates will be examined in English Grammar and Composition, Arithmetic, Latin Grammar and Construction, and Prose Composition. Boys over Thirteen years of age will also be examined in Greek, French, and Geometry.

The successful Candidates will be required to reside in the College, and will be admitted in the month of September following their election.

The ordinary charges for each Boy are as follows:

Entrance Fee ..... 10 Guineas.

ANNUAL CHARGE.

Board .....£60 per Annum.
Tuition ..... £15 "

But in the case of Scholars the Entrance Fee will not be exacted; so that the actual annual cost of each Scholar, giving credit for the amount of the Scholarship, will be £45.

The names of intending Competitors for the Scholarships must be lodged with Mr. FREDERICK FITMAN, W.S., 48 Castle Street, Edinburgh, Clerk to the Trustees, not later than July 1, 1873.

CLIFTON COLLEGE.—SCHOLARSHIPS—The following will be open to Competition at Midsummer:

1. One or more of the value of £80 a year (equivalent to both Board and Tuition free), tenable during the holder's stay at the College.
2. One of £70 a year, open to Boys under Seventeen.
3. One or more of £45 a year, open to Boys under Sixteen.
4. One or more of £25 a year, open to Boys under Fifteen.

For Numbers 1 and 4 an allowance for age is made in favour of young Boys.

The Examination will commence on Wednesday, June 18, at 9 A.M.

Further information can be obtained of the HEAD-MASTER, The College, Clifton, Bristol.

SIDNEY YOUNG, Esq. (late Young, Son, & Magnay).

Secretary and Accountant—SYDNEY J. NICOLLE, Esq.

TEMPORARY OFFICES—CLEMENT'S HOUSE, CLEMENT'S LANE, E.C.

This Bank will commence business by the receipt of deposits and the supply of blank forms of cheques for amounts of £10 each or under in June next.
It has been established on a system, originated by Mr. HERTZ, to afford facilities to various classes who have hitherto been unable to avail themselves of the advantages of banking, and also to extend the use of cheques of the CHEQUE BANK to numerous purposes for which cash payments have hitherto been required. It is intended to be an auxiliary and not an opponent of all Banking institutions already established.
All cheques must be drawn on the forms provided by the Bank.
No blank cheque will be supplied until the maximum amount for which it can be filled up has been paid to the credit of the CHEQUE BANK with one of the Banks with which it is in relation, or deposited with the CHEQUE BANK at any of its own Offices. No cheques on this Bank against an overdrawn account can, therefore, be in circulation. No cheque can be filled up for a greater amount than £10.
Every blank cheque will bear stamped on its face the full amount for which it may be drawn, but it may be filled up for any less sum.
Convenient books will be provided, of £10, £20, £30, £40, £50, up to £100. Each book will contain ten cheques of the same maximum denomination, which will be from £1 to £10 each, as the depositor may require. The charge for a book of ten cheques will be 1s., which includes the Government stamps.
Undrawn balances will be carried forward to the credit of the customer, towards a fresh cheque book, or repaid.
All cheques will be crossed and payable to order, and, therefore, as they will require endorsement by the person in whose favour they are drawn, necessitate his giving such endorsement proof of payment to him.
A simple, safe, and economical plan has thus been provided, for the following amongst many other purposes:—
1. Petty cash payments and office expenses of Merchants, Warehousemen, Manufacturers, Companies, and others.
2. Remittances of small sums to the country or abroad.
3. Payments of household and petty expenses in London and the suburbs.
4. Payment of charitable donations and subscriptions.
5. Payments at quarterly or monthly salaries.
6. Allowances to wives, daughters, minors, widows, and annuitants.
7. Disbursements by commercial travellers and tourists.
8. For the use of foreigners in lieu of circular notes or letters of credit.
Persons hitherto without banking accounts can deposit their cash at the Offices of the CHEQUE BANK, or pay the same to the credit of the CHEQUE BANK to any banker in relation with it, and may, at their convenience, receive cheque books for the amounts deposited.
The CHEQUE BANK will not pay interest on deposits, will not discount bills, nor make advances, nor enter into any financial transactions. All moneys received will be deposited with the banks in relation with the CHEQUE BANK, Limited. The names of such Bankers will be published from time to time.
The CHEQUE BANK will commence business in June next, at 1 Cook-pur Street, Pall Mall East, S.W.

GOVERNMENT STOCK INVESTMENT COMPANY, Limited,
28 CORNHILL, E.C.

CAPITAL—£1,000,000. FIRST ISSUE, £500,000.

The Capital and Deposits received by this Company are invested in Government Stocks and Guaranteed Securities, which are quarterly inspected by the Auditors, who certify as to correctness and advertise their Certificate, thereby giving the most unquestionable security.

5½ per Cent. per Annum for Five Years.
5 per Cent. per Annum for Three Years.
DEPOSITS, with one month's notice of withdrawal, 4 per Cent. below the current Bank rate for three months, the current Bank rate for six months, and Five per Cent. for twelve months.
ADVANCES made on Deposit of British, Foreign, and Colonial Government Stocks.
A. W. RAY, *Manager.*

THE AGRA BANK, Limited.—Established in 1833.
CAPITAL, £1,000,000.
HEAD OFFICE—NICHOLAS LANE, LOMBARD STREET, LONDON.
BRANCHES in Edinburgh, Calcutta, Bombay, Madras, Kurrachee, Agra, Lahore, Shanghai, Hong Kong.
Current Accounts are kept at the Head Office on the Terms customary with London Bankers, and interest allowed when the Credit Balance does not fall below £100.
Deposits received for fixed periods on the following terms, viz.:
At 5 per cent. per ann., subject to 12 months' Notice of Withdrawal.
For shorter periods Deposits will be received on terms to be agreed upon.
Bills issued at the current exchange of the day on any of the Branches of the Bank; free of extra charge; and Approved Bills purchased or sent for collection.
Sales and Purchases effected in British and Foreign Securities, in East India Stock and Loans, and the safe custody of the same undertaken.
Interest drawn, and Army, Navy, and Civil Pay and Pensions realised.
Every other description of Banking Business and Money Agency, British and Indian, transacted.
J. THOMSON, *Chairman.*

LONDON and LANCASHIRE LIFE ASSURANCE COMPANY, Leadenhall Street, London.
Board of Direction.
Chairman—Colonel KINGSCOTE, C.B., M.P.
Deputy-Chairman—J. H. MACKENZIE, Esq.
Hon. Evelyn Ashley. | Ald. Sir Thomas Dakin.
Abel Chapman, Esq. | R. Barclay Reynolds, Esq.
Samuel Gurney Sheppard, Esq.
At the Annual Meeting of the Proprietors, held at the London Tavern, on April 29, 1873,
The New Assurances effected during the past year were for £281,480, producing a New Premium Income of £8,530.
The result of the Valuation, made on the strictest principles, was a Bonus distribution of £1 per cent. per annum as an addition to the Whole Life Participating Policies, equivalent to a percentage varying from 25 to 50 per cent. of the Premiums paid, and an addition of 20 per cent. to the Shareholders' Fund.
Reports and copies of the Accounts may be had on application.
W. P. CLIBBORN, *Manager and Actuary.*

GENERAL ASSURANCE COMPANY.

THE FRENCH CONSERVATIVES AND M. THIERS.

If the motives of the majority which has overthrown M. THIERS had to be divined from the Duke of BROGLIE'S speech, the French Conservatives would appear even more unwise than they really are. That men who wish to re-establish Monarchy in any shape whatever should feel M. THIERS to be an insurmountable obstacle is intelligible, and from this point of view it is probable that his deposition has not been resolved on a moment too soon. What is more doubtful is, whether it has been resolved on quite soon enough. But the Duke of BROGLIE asks the world to believe that the interests of Conservatism as apart from Monarchy would have suffered by M. THIERS remaining in office. There was not a word in his speech about a Restoration, there was not even any waste of emotion over the extinct Bordeaux Compact. The policy of the Government was throughout described and assailed, not as a Republican, but as a Radical, policy. The Duke was good enough to acquit M. THIERS and his Cabinet of any intention of overturning the existing foundations of society; indeed he predicted that the Ministers themselves would be among the first victims of their own blindness. But concession to Radicalism may be quite as mischievous as Radicalism itself; and concession to Radicalism, the Duke of BROGLIE says, has from the first been one of the elements of which M. THIERS'S policy has been composed. It is true that frank hostility to Radicalism has been another element, and that at particular periods and in particular parts of the country this latter element has even been predominant. But the state of affairs has become too serious for the Conservative party to rest content with a half-and-half allegiance. As represented by the Duke of BROGLIE, they felt that it was time for M. THIERS to make his choice and for them to make theirs. A new Ministry had been formed during the recess, and the indications of the PRESIDENT'S intentions afforded by the change were all of the wrong sort. The Duke of BROGLIE confessed that the Bill depriving Lyons of municipal freedom had in some respects served as a trap for the Government. It had excited immense hostility on the part of the Radicals, and this was exactly what it was intended to do. The Conservatives meant fighting, and Lyons was the field chosen for the first battle. The Government fell into the snare, and found themselves committed as regards the great cities to a policy of simple suppression. As soon, however, as they found out what they had done, they set to work to disavow it. The conflict in the Assembly was reproduced in the Cabinet by the contention between M. DE GOULARD and M. JULES SIMON. If M. SIMON had been got rid of and M. DE GOULARD had been retained, no Conservative assurances need have been demanded. But the value of M. SIMON'S dismissal was neutralized by M. DE GOULARD'S having to bear him company in exile, and the composition of the new Cabinet was of a kind to show that it represents concession to Radicalism rather than resistance. Consequently the Conservative party had no choice left them but to eject it from office at any cost. If they failed in the effort, they would at least have delivered their own consciences, and be guiltless of any complicity with a policy which must inevitably make all those who have a share in it mere dependents of the Radicals.

If this speech expressed the real views of the Conservative party in France, it would be difficult to explain such extraordinary political blindness. It is intelligible that the Left should have objected to the organization of the Republic by M. THIERS and the existing Assembly. It is intelligible that more cautious observers, whether in France or elsewhere, should have shared in this objection, on the ground that the danger of exasperating the Republicans beyond endurance was too great to be encountered without some better cause than had been shown. What is not intelligible is that Conservatives professing to care for Conservatism more than for Monarchy, and as ready to run risks in support of their preference as the event has shown them to be, should have disliked the prospect before them. The great object of Radical politicians in France for the last two years has been to prevent the exercise of constituent powers by the Assembly. M. THIERS had, after long hesitation, agreed to treat the Assembly as constituent, and had brought in a Bill which would have made France a Republic of an exceedingly Conservative type. It is possible that this Republic would have been so unpopular with advanced Republicans that it would only have excited them to attempt its destruction at some future time. But this possibility attached to it in common with every device for making the Government the legal expression of the Conservative feeling of the country. There had been a safer road open to the Conservatives some time ago, but that road had been closed against them by their own obstinacy. They might have dissolved the Assembly at the time when almost every election would have gone in favour of the candidate who was loudest in support of M. THIERS, and then have carried through the work of organization with an Assembly composed of these materials. They threw away that opportunity because they wanted an Assembly which would be Monarchical as well as Republican, and the second best choice only was left to them. Even this they have deliberately rejected. It will be very difficult for them now to found a Conservative Republic, even if they should conceive the wish to do so. With or without cause, they have become associated in the minds of the Republican party with the notion of a Monarchical Restoration, and every essay they make towards framing a Constitution will be viewed with cold distrust and accepted, if accepted at all, as the act of a usurper, who must be submitted to so long and so long only as there is no one strong enough to send him about his business. Under any circumstances this would have been a danger ahead, and if there were any man who could have carried the ship through the breakers it was M. THIERS. The Conservatives have rejected his aid at the precise juncture when it had become more than ever indispensable to them. M. THIERS'S speech must have carried this conviction to their minds if their fears of Radicalism had been the sole motive of their interpellation. The picture he drew of a Republic fenced round with all manner of Conservative institutions was precisely what ought to have charmed them, had their real and their declared wishes been identical. That it had no attractions for them, that it did not prevent them from voting against the order of the day after they had learned that its rejection would entail the resignation of the PRESIDENT, is conclusive evidence that they had other interests in view than those of Conservatism. The authors of the interpellation may say, if they choose, that the form of Government was not under discussion; but it was under discussion indirectly. If the interests which the majority had at heart had not been associated with Monarchy as opposed to a Republic, they would never have thought of promoting them by overthrowing M. THIERS.

The vote of the 24th of May is nothing less, therefore, than a Monarchical conspiracy, so far as the term can be applied to an attempt to obtain an end which is legitimate, however unwise, by means which have not as yet involved any violation of constitutional forms. In the sense, however of an attempt to do one thing while professing to do another, it is strictly a conspiracy. Fortunately for France, it is a conspiracy which can hardly bear the light of day without instantly breaking up. There are three parties in the Assembly who have a keen interest in preventing the foundation of a lasting Republic, but each of them is equally interested in preventing the founda-

tion of the particular Monarchy desired by the other two. M. THIERS's description of the condition of the Monarchical party is completely borne out by the composition of the new Cabinet; Legitimists, Orleanists, and Imperialists are all represented in it. It is not very long in point of time since the Duke of AUDIFFRET PASQUIER would have been regarded as an indispensable member of any Ministry taken from the Right. But the Duke had the misfortune to make a speech against the Empire before the Orleanists had discovered that it was not enough for them to make friends of the elder branch of the House of BOURBON unless they could come to terms with the House of BONAPARTE as well. The division was too close to allow a single vote to be dispensed with, and the Imperialists, though they can claim at most half-a-dozen deputies, have obtained a place for at least one of them in the Cabinet. Hereafter, if it should appear that NAPOLEON IV. has a better chance of reigning than HENRY V. or LOUIS-PHILIPPE II., they will no doubt find Orleanists and Legitimists equally ready to play into their hands. The Duke of BROGLIE will have discovered by that time, what he has probably begun to suspect already, that safe servitude even under a BONAPARTE is better than the dangerous liberty of a Republic. He is tired even of that amount of unchartered freedom which has been permitted under the rule of M. THIERS, and it will not be difficult for him to find merits formerly unperceived in the changeless repose which characterizes legislatures returned by obedient voters under the guidance of properly drilled prefects. At present, however, this is only a vision of the future. It is not likely that any one of the three parties to the coalition has as yet abandoned the hope that the crown will be found under its own particular thimble. In the natural unwillingness of the two who have been duped to anticipate the painful moment when their dawning suspicions will be verified, and in the prudent acquiescence of the third in a refusal to see things as they are which is so likely to end in making them what it wishes them to be, lies for the present the best hope of free government in France.

THE O'KEEFFE CASE.

ONE more stage in the interminable O'KEEFFE case has been reached, and the jury have given the plaintiff a verdict with a farthing damages in his action for libel against Cardinal CULLEN. But the verdict is really that of the judge and not of the jury, for the jury wished to be discharged without giving any verdict at all, and it was only in obedience to the positive commands of the CHIEF JUSTICE that they gave the plaintiff a verdict, marking by the smallness of the damages their sense of the pressure put upon them. In itself the history of Father O'KEEFFE, of his rights and his wrongs, his schemings and his defeats, his pugnacity, and the conduct of his spiritual superiors towards him, is inexpressibly dreary. He must have been a very unpleasant subordinate, but then his superiors behaved in a decidedly unpleasant way towards him. It is only on account of the main question of law involved that the case is worth noticing. No doubt this is a question of some importance, although it is really nothing more than the question whether a statute of Elizabeth, forbidding the introduction of or acting upon Papal Bulls or Rescripts, is in force in Ireland or has been repealed by implication. Cardinal CULLEN suspended Father O'KEEFFE from his office of parish priest of Callan, and announced in writing that he had suspended him. This announcement constituted the libel complained of. Father O'KEEFFE said that he had not been suspended by any competent authority, and that it was defaming him in his character as a parish priest to say that he had been. The CHIEF JUSTICE instructed the jury that, if it was true that the plaintiff had not been suspended by competent authority, it was libellous to say that he had been, although the Cardinal was acting perfectly *bonâ fide*, and was only discharging what he believed to be a duty of his office in announcing the plaintiff's suspension. In point of fact the plaintiff had been suspended by the Cardinal acting under a Papal Rescript. Without the authority which this Rescript gave him, the Cardinal could not have suspended Father O'KEEFFE; for it is the province of his bishop to suspend a parish priest, not of an archbishop, and Cardinal CULLEN could not, as Archbishop, have suspended the plaintiff. He acted in virtue of a Papal Rescript empowering him to act; but the Rescript was, according to the CHIEF JUSTICE, wholly illegal. It was an offence in Cardinal CULLEN to act at all on it in Ireland, for he was positively forbidden to do so by an unrepealed statute. While the Cardinal, in his answer to the action, said that it was true that the plaintiff had been suspended in a manner consistent with English law, the CHIEF JUSTICE said that this was untrue, for that English law distinctly forbade the use of the means by which he had been suspended. And this brings us to the O'KEEFFE case as it comes before Parliament. The National Board is in danger of being censured because it treated the suspension of Father O'KEEFFE as valid. In the first instance the Board only received a notification from the Bishop that Father O'KEEFFE had been suspended, but they had sufficient notice before they finally acted that the real authority under which he had been suspended was that of the Archbishop. According to the CHIEF JUSTICE, directly they knew this, they ought to have known that an archbishop could not, without the authority of a Rescript, have suspended a priest; and that to act on any Rescript of the kind was positively illegal. Exactly the same thing happened with the Poor Law Board, which has been praised for having given the plaintiff a hearing which the National Board denied him. After some correspondence had passed, the Poor Law Board actually quoted the terms of the suspension, showing that it was issued by an Archbishop, and informed Father O'KEEFFE that they saw no reason to doubt that his suspension had proceeded from a competent authority. What then, as the CHIEF JUSTICE asked, was the competent authority that satisfied them? It was, he took for granted, the Papal delegation to the Cardinal, and "they obeyed and executed the "Papal mandate." In doing this he intimated that they were guilty of high treason, which is a very alarming end of the business, and shows how dangerous a thing it is to be mixed up with the quarrels of Irish ecclesiastics.

For a moment it will be advantageous to turn to another aspect of the O'KEEFFE case, and to regard the question at issue as purely one of contract. It was argued for Cardinal CULLEN that the plaintiff, by accepting the position of a parish priest in the Romish Church, had contracted to accept all the consequences of that position, and among them that of being suspended if the POPE, through any duly appointed delegate, chose to suspend him. The CHIEF JUSTICE invited the jury to look at the matter from this point of view; but then, he said, suspension is a judicial act, and the law will not allow an English subject to contract himself out of the right to have a fair trial before a judicial sentence is pronounced against him. In the eyes of the CHIEF JUSTICE Father O'KEEFFE never had a fair trial, and he grounded this conclusion partly on the treatment which the plaintiff had received from his ecclesiastical superior during a long and stormy career, and partly on the fact of the Cardinal's having finally suspended him without having properly allowed him to say what he had to say in his defence. Thus the whole story of Father O'KEEFFE was imported into the trial, and it became quite clear that in his time he had given as much trouble and suffered as much annoyance as most men. In his early days at Callan he was a prosperous and energetic man, standing well with his Bishop, and with a reputation for learning. But he at last aspired too highly. He took it into his head that the one thing wanting to his perfect success at Callan was that he should be allowed to set up an establishment of nuns in his parish. His Bishop fenced with him for some time, and at last pronounced that he was not a proper person to have the charge of nuns. Father O'KEEFFE immediately threatened an action, and the Bishop compromised the matter by paying 550*l.* He took his revenge, however, by sending to Callan two curates who were thorns in the Father's flesh, and denounced him in his own church as a liar. The Father immediately went to law, and succeeded in one of the actions he brought for libel. For this disobedience to canonical rules he was threatened with suspension, but nothing had been done to show him that his position had been altered, until the eve of an election for a new bishop, when he was informed that his vote could not be received, as he was threatened with suspension; and it is said that the reason of this sudden intervention was that there was a very close contest for the bishopric between a nephew of Cardinal CULLEN and an O'KEEFFE, and the Father's vote might have turned the scale. Further he wished to be allowed to go to Rome to plead his cause, but Cardinal CULLEN happened to be at Rome when his application arrived, and in consequence, as it is said, of the Cardinal's intervention, leave was refused him. Whether this is a fair account of the Cardinal's action in the matter we do not know, but there can be no doubt that the CHIEF JUSTICE wished to convey to the jury the impression that the natural interpretation to put on the Cardinal's interference was that it was such as to prevent the plaintiff from being fairly tried. Lastly, the Cardinal, when he finally proceeded to suspend the plaintiff, did so in a manner which distinguished canonists who were called as witnesses pronounced quite regular, but which is technically

known as acting *ex informatâ conscientiâ*, and which comes to this—that when an ecclesiastical superior thinks he knows enough about the case of an inferior, he need not trouble himself to go any further, but may act at once. According to the CHIEF JUSTICE, this is not consistent with English law. An English subject cannot contract that another shall inflict upon him pecuniary loss when merely acting *ex informatâ conscientiâ*. The person who is to inflict the penalty must take some better means of ascertaining that he is doing justice, and at least he must give the person he is judging a fair opportunity of defence.

Here, however, we are brought back again to the statute of ELIZABETH. The priest makes a contract by accepting his position, but what that contract is must be judged from all the circumstances in which he finds himself. The Canonists say that a priest binds himself to be judged *ex informatâ conscientiâ* in case his ecclesiastical superiors think proper to judge him in this way; but they only say this because this mode of judging is permitted or enjoined by a particular Papal Bull. If a priest lives in a country where the operation of this Bull is prohibited by a special law, he must, for legal purposes, the CHIEF JUSTICE says, be held to be contracting with regard to this statutory enactment. His ecclesiastical superiors, in fact, if the CHIEF JUSTICE is right, by allowing him to act as a priest in a country where this Bull has no force, agree to accord him an exemption from its operation. A priest tacitly contracts to render full canonical obedience, but an Irish priest, by the mere fact of his being in Ireland, gives notice that in his case the obligation of obeying judgments *ex informatâ conscientiâ* is not a part of his contract. This is not the consequence of legislation which is exclusively English. In Catholic countries it used at one time to be the received theory that Papal Bulls did not operate in a country until they were brought into its territory and published there, and the most rigid precautions were taken to prevent a messenger who was supposed to have a Bull in his pocket from crossing the frontier. Priests whom such Bulls threatened were thus protected by the State, and it was part of their general legal position that, so long as the Bull was kept out of the country, it should be held as non-existent in all local courts, ecclesiastical as well as civil. We shall probably hear a great deal more of the O'KEEFFE case, and of the questions growing out of it, and the first thing that will occur to most English minds is that, if the statute of ELIZABETH is really in force, the best thing is to repeal it, and to leave Irish priests perfectly free to make any contract that they please which the general principles of English law will permit English Courts to recognize. But although this will probably be the result of the controversy, yet it is not quite so simple a solution of the difficulty as might appear. If the CHIEF JUSTICE is right, this statute is a bulwark against ecclesiastical tyranny; and existing priests may say that they became priests in Ireland under the protection thus accorded to them, and that to repeal the statute would be to alter to their prejudice a contract which they made in reliance upon the special provisions of English law. Strict justice might, therefore, be said to demand that the repealing Act should provide that the statute of ELIZABETH shall be held to be in force for the benefit of all priests already ordained in any part of the British dominion to which that statute now extends. But nothing, it is certain, would be more distasteful to the Romish hierarchy than such a proviso, which they would consider a fatal blow to their disciplinary powers; and as most Roman Catholics would agree with their bishops as to this, we should be once more proposing to pass a Bill displeasing to Roman Catholics, when we had no other reason for passing it than our wish to please them. The more the whole subject is considered, the more its difficulties grow upon us, and it must be a great delight to Father O'KEEFFE, who evidently loves a fight for the mere fun of it, that he has set a contest raging the end of which no one can as yet pretend to see.

THE *ALABAMA* VOTE.

IT had been hoped that the *Alabama* controversy was finally at an end; but Mr. BENTINCK availed himself of his technical right to discuss the vote for payment of the damages, and perhaps some future excuse may be found for reviving once more the unpalatable discussion. Mr. BENTINCK's opinions are not confined to himself; but there is little advantage in repeating again and again the admission that the arbitration has not been glorious or satisfactory to England. The Government and nation may fairly claim not only the credit but the monopoly of moderation, of courtesy, of consistency, and of good faith; but the world admires successful arrogance and astuteness more cordially than it esteems milder virtues. The Americans would probably have been mortified at the failure of the notorious Indirect Claims if they had not provided themselves with an apocryphal theory to explain or conceal their defeat. Although the English agents refused, in accordance with their instructions, to appear before the arbitrators until the claims were withdrawn, Mr. BANCROFT DAVIS and Mr. FISH endeavour to persuade their countrymen that the preliminary refusal of the arbitrators to entertain a monstrous contention amounted, notwithstanding the absence of one of the parties, to a judicial decision. The characteristic passion for sharp practice has been indulged by another unexpected triumph. Ordinary litigants believe, or wish others to believe, that the claims which they have established are not only successful but just. The House of Representatives has deliberately and gratuitously announced that the Geneva Tribunal has been taken in. The damages awarded for injuries supposed to have been suffered by American citizens are, according to General BUTLER and his majority, exorbitant and partially unfounded; and it is consequently proposed that the Government of the United States shall appropriate to its own purposes the difference between the damages actually incurred and the amount which was obtained by the ingenuity of the American agents and counsel. In this instance Congress has overreached itself, for the cynicism of the proceeding has been regarded in England rather with amused complacency than with serious indignation; yet Mr. BENTINCK is justified in his belief that the result of the contest has on the whole been favourable to the more aggressive and pertinacious disputant. Foreign nations, though they censured the audacious claim for consequential damages, rightly judge that the party which conceded the most was especially anxious for a settlement on any terms. The defeated cause may have approved itself to moralists and jurists, but fortune visibly favoured the side of the victor.

Sir STAFFORD NORTHCOTE, who, as a member of the Opposition, ought not to have been employed on the Washington Commission, evidently regrets his own share in the negotiations. His speech on Mr. BENTINCK's motion was directed to the object of devolving the whole of the responsibility on the Government at home. It is true that diplomatists placed, as Sir S. NORTHCOTE said, at the end of a telegraphic wire occupy an embarrassing position. No agent would wish to conduct an important commercial negotiation with his principal in the next room. The American Commissioners fully understood that the English Government was bent on the conclusion of a treaty; and it could not therefore be expected that they would be chary in their demands or liberal in their concessions. Whenever the English plenipotentiaries hesitated, their colleagues willingly gave them time to consult the oracle at home, in well-founded confidence that the answer would be agreeable to their own wishes. Lord RIPON and Sir STAFFORD NORTHCOTE must be acquitted of undue pliability; but less dignified agents might not less efficiently have deciphered and transmitted telegraphic messages. The proper function of ambassadors and diplomatic agents is to interpose themselves between the conflicting passions and interests of their respective Governments. When they are actually and professedly mere recipients from hour to hour of peremptory instructions, they are, like buffers with broken springs, incapable of modifying the shock of a collision. On a former occasion Sir S. NORTHCOTE confessed that the English plenipotentiaries had, with or without fault of their own, entirely misapprehended the intentions of the American Commissioners. It is probable that their own reports to the English Government may have sometimes conveyed erroneous impressions, and future diplomatists may learn the lesson that the electric telegraph is at the same time too peremptory and too uncertain. Since the days when the Spartan Ephors exchanged epigrammatic despatches with their kings and generals in the field, it has not been found convenient to study Laconic brevity in diplomatic communications. Shades of meaning, degrees of probability, and distinctions between ultimate resolutions and tentative professions of policy cannot easily be conveyed by transmarine cables. In the case of the Washington negotiations it may be conjectured, not that the English Government was habitually misinformed, but that the Commissioners were not allowed sufficient discretion. It might be a salutary rule for diplomatists to affect inability to use the electric telegraph. The loss of time which would be incurred by waiting for the regular course of despatches might not be without compensating advantages.

Mr. GLADSTONE, who might perhaps have dispensed with the necessity of answering Mr. BENTINCK, adopted the style of official commonplace which he has of late judiciously cultivated. No quality of the same order more justly commands the confidence of Parliament than the art of saying as much as is sufficient for the purpose, without propounding general doctrines or questionable principles. It was highly proper that Mr. GLADSTONE should explain away the new rules of international law into mere glosses or amplifications of established maxims of jurisprudence. Due diligence, as he forcibly explained, means the diligence which is due; and if the Geneva Arbitrators have measured the obligation by a novel and inadmissible standard, the fault lies not with the Commissioners who assented to the use of the term, but with the tribunal which afterwards misunderstood it. There was a trace of Mr. GLADSTONE'S natural subtlety of mind in the statement that the claims for the Fenian incursions into Canada have not been settled, inasmuch as they were, at the instance of the American counsel, excluded from the negotiation and from the treaty. It is true that the Canadians have nothing to complain of, since they accepted the guarantee of a part of the cost of a railway in satisfaction for their claims, but the right which has been reserved of asking satisfaction for the Fenian outrages is barren and unprofitable. It is quite certain that no demand of the kind will ever be admitted, in the improbable contingency of its being preferred. The American Commissioners bluntly refused to entertain a claim which was far better founded than their own, and the English Government is practically estopped, by acquiescing in the refusal, from hereafter reviving the demand. The rest of Mr. GLADSTONE'S speech amounted to a virtual assertion that it was inexpedient to discuss the *Alabama* or the Arbitration any further. It is for the benefit of the community of nations that litigation should at some time cease, and, if humiliation has been incurred, there is no use in keeping unpleasant associations fresh in memory. If Mr. LOWE or Mr. GLYN has at any time used injudicious language, Mr. GLADSTONE conventionally explains that he is not responsible for the non-official words of his colleagues, and that they have probably been misreported. It is much to be wished that he may baffle more serious attacks on his Government with equal prudence.

The English Government is fortunately not bound to notice either Mr. CUSHING'S scurrilous lampoon, or the correspondence between Mr. BANCROFT DAVIS and Mr. FISH. If the American counsel and agents, or even the SECRETARY of STATE, think fit to exchange with one another misrepresentations of the proceedings in the *Alabama* case, their bad feeling and bad taste are matters only of domestic concern. Nearly twenty years ago Mr. CUSHING, then Attorney-General, thought fit publicly to affront the English Crown in terms of wanton insolence. It now appears that he contributed some of the more offensive portions of the American Case, although Mr. BANCROFT DAVIS and Mr. FISH assume the exclusive paternity of the Indirect Claims. It seems to foreigners that the attempt to convert the reference to arbitration into an occasion of insult was thoroughly discreditable; but it must be presumed that American functionaries understand the temper of their countrymen. The only point in the correspondence which deserves attention is the intimation on the part of Mr. FISH that his Government, having profited by an extravagant interpretation of international law to the detriment of neutrals, intends hereafter to repudiate the contention of its advocates and the decisions of the tribunal by straining, in case of need, the rules of law to the detriment of future belligerents. In substance, Mr. FISH holds out a threat that if England should be at war with any third Power, American citizens will be allowed to equip cruisers against English commerce. The sound legal doctrines maintained by Sir ALEXANDER COCKBURN are to be accepted whenever they may suit American interests, on the pretext that the LORD CHIEF JUSTICE described himself as a representative of England for the non-judicial purpose of vindicating the character of an English statesman. No official declaration was needed to show that the judgment of Geneva would be only so far accepted by the United States as it might from time to time suit American interests; but credulous philanthropists, if they were accessible to conviction, might profit by the earliest illustration of the advantages of the new millennium. The anticipation that the equipment of American *Alabamas* would be rendered impossible by the Geneva award is already proved to be unsound. Three millions will have been paid exclusively for the settlement of a single quarrel.

PRESIDENT MACMAHON.

THE promptitude with which a new Cabinet has been constructed and a new President elected does more credit to the organization than to the frankness of the majority in the French Assembly. The Duke of BROGLIE spoke on Friday as though he were anxious to obtain some reassuring declaration from M. THIERS or his Ministers, but like other orators who profess to pause for a reply, he had evidently made up his mind that no declaration should reassure him. On former occasions when the Right have driven M. THIERS hard, it has been with the intention of bringing the truant back to their side. This time, though their speeches have pointed to the same design, their acts have shown that their object was to get rid of him altogether. The Cabinet which they have presented to the new PRESIDENT had been decided on before the debate began, and if the President to whom it was to be presented was not determined on so early, it was not from any lingering wish to retain M. THIERS. The Duke of AUMALE had been the favourite down to the latest stage of the negotiations, and it was not seemingly until the eve of the division that the Bonapartists used their strength to veto an Orleanist nomination. The election of the Duke of AUMALE would have made the Orleanist Candidate the favourite in the Monarchical race, and the Imperialists are naturally resolved that, for the present, affairs shall be carried on under a revised edition of the Bordeaux Compact. Under the old form of this understanding the decision what should be the ultimate form of Government was deferred to a more convenient season. Under the new form, it is taken for granted that the Government is to be Monarchical, but the choice of a dynasty is still allowed to stand over.

The substitution of Marshal MACMAHON for the Duke of AUMALE is in this respect a decided advantage for France. It postpones the ripening of the Monarchical pear, and so gives additional opportunities for the development of those many chances which may prevent it from ripening at all. If the majority in the Assembly had been determined to bring about an early restoration, and if Marshal MACMAHON had rendered them the same unquestioning obedience as Commander-in-Chief which he promises to render them as President, it is possible that France might for a time have been given over to the BOURBONS. How hopelessly unstable such a settlement would have been needs no showing, and the nation may be congratulated that the internal divisions in the Monarchical party have made such a counter-revolution for the present impossible. Under Marshal MACMAHON Republican institutions will be preserved at all events in form. To all appearance he is the one person connected with the change of Government whose conduct is not open to blame. When M. THIERS had resigned, Marshal MACMAHON had only to consider whether it was better for France that he should become President himself or command the army under the orders of some other President. Unless the Marshal's character has been altogether misread, the decision to which he came is the decision which would have been recommended to him by any impartial adviser. As the Assembly will not have M. THIERS to rule over them, it is best that the President should not be in any sense a politician. Marshal MACMAHON will at least hold the balance even between the rival sections of the majority, whereas any other President would probably have thrown the weight of his influence on the side of one or other of them. By inclination, though not as yet by law, Marshal MACMAHON will be precisely that Constitutional President which the Right have professed to wish for. He is not yet irresponsible, but there is some talk of a Bill being introduced to make him so, and the Marshal will probably offer no objection to the change. It may be doubted, however, whether the Right will not on sober reflection see reason to distrust their former impressions on this head. If M. THIERS could have been reduced to play this subordinate part, and accept from the majority a Ministry which possessed its confidence, two important points would have been gained. The party which had everything its own way in the Assembly would have had everything its own way in the Executive also, and the most dangerous member of the Opposition would have been silenced, for even M. THIERS could hardly have spoken and voted against his own Cabinet. Now, however, the majority can no longer rely upon having everything its own way in the Assembly. It has gained one decisive victory, and the magnitude of the result has somewhat obscured the proportions of the conquering army. A very few votes would have settled matters the other way; and when parties are nearly equally balanced, and the cohesion of the majority is at all imperfect, the trans-

for of a few votes is far from being an impossible contingency. If Marshal MacMahon becomes an irresponsible President, he must take his Ministers from the majority, whether that majority be on the Right or on the Left. But if it should by any chance be found on the wrong side, the conception of the President's duty which the Right have hitherto entertained will probably be completely reversed. They will insist that he ought to be as regardless of the majority in the Chamber as they are themselves of the majority in the country, and to retain Ministers of sound views in office without regard to the accident of a hostile vote. It will be difficult, we imagine, to bring Marshal MacMahon to make himself thus independent of the Assembly, even if the Right should so far forget consistency as to ask it of him. And if he persists in accepting all Ministries with the same absence of personal choice which he has shown in accepting his present Ministry, it is quite possible that some new combination of parties may before long put the Duke of Broglie in a minority. The debating strength of the Left will be very great, and the fact that the Right is in power will give it the unanimity which it has hitherto wanted. There would have been great obstacles in the way of an agreement between M. Thiers, M. Grévy, and M. Gambetta, if that agreement had had to be based on actual legislation. But there need be no obstacles when all they will have to do in common is to pull to pieces other people's legislation.

It is even conceivable that this fact may have been present to M. Thiers's mind when he decided to make the defeat of his Ministers the occasion of his own resignation. He has all along cherished a very confident belief in his power of managing the existing Assembly. For two years he has managed it as President, and now that he has done all he can do in that way, he may look forward to managing it as leader of the Opposition. Such statements as that he is actively employed in arranging his papers and will very seldom be in his place in the Assembly, that he has no intention of making opposition to the Government the object of his own policy, and that he will say nothing against their policy until it has taken a definite shape, do not at all affect these speculations. Every leader of Opposition uses these phrases at the opening of the campaign. It would not be decent to pledge himself to oppose a policy before he knows what it is, and M. Thiers's dignity requires that there should be some interval between his last appearance as President of the Republic and his first appearance as a candidate for the post of First Minister. But that this will be the object at which he will next aim is by no means unlikely. He may very well have satisfied himself that his part as President is played out. His attachment to American precedents prevented him from making the President an officer appointed by the majority of the Assembly, and removable at the pleasure of those who appointed him, subject to an appeal to the country. In his own projected Constitution the President is elected for a term of years, and the Legislature is reinforced for the purpose of acting as an Electoral College by representatives of the Departmental Councils. It would have been difficult for a President thus appointed to have been Prime Minister as well as President; and we may be sure that, if M. Thiers found himself forced to contemplate a separation of the functions hitherto united in himself, it was to the former that his thoughts turned with most affection. A President has now been chosen who prefers to see the post of Prime Minister held by some one else. If he continues to take this view, the vote which will some day displace the Duke of Broglie may leave Marshal MacMahon firm in his seat. The hopes of the Right appear to be chiefly fixed on the power of influencing the elections which they will gain by making a clean sweep of Republican prefects. But in the present state of parties in the Assembly a reverse may still overtake them before they have found courage to venture upon a dissolution. In every majority there are some feeble hearts to whom the bolder of any two policies is always the more distasteful. If in the course of a debate in which the Ministers have been beaten alike in argument and in oratory, these weak brethren arrive at a conviction that the cause of the Opposition is the popular cause, they may choose to reap the certain benefit of supporting it rather than to take the chance of being guaranteed against the risks of opposing it by the efforts of a prefect who may have less influence with the electors than he thinks. The one thing that would upset all these calculations, and deliver France over to a military dictatorship, would be any illegal action on the side of the Republicans. So long as the Monarchical party keep within strictly legal limits, there is no pretext for their being resisted except by strictly legal expedients. Fortunately for the future alike of the country and of their cause, the Republicans have as yet shown a clear and unexpected appreciation of this essential truth.

M. DE LESSEPS'S NEW PROJECT.

After the completion of the Suez Canal, M. de Lesseps is justified in sanguine expectations of the practicability and success of great material enterprises. The physical difficulties which were thought to render doubtful the accomplishment of his former scheme offer less impediment to the construction of a great Asiatic railway. There is no doubt that it would be possible to form a permanent way for the reception of rails both on the plains and along the mountain passes. The distance, according to M. de Lesseps, from Orenburg to Peshawur is 2,350 miles, of which 850 miles separate Peshawur from Samarcand. He proposes that the Russian Government should afford facilities for constructing the Northern portion of the line, while England undertakes the extension of the Peshawur line to Samarcand. Although General Ignatieff agrees with M. de Lesseps in the opinion that the work is practicable, it has not yet been thought expedient to define the course of the railway. It may be presumed that from Samarcand to the Sea of Aral the line is to follow the course of the Sir Darya or Jaxartes; but the mode of crossing the mountain ranges of Afghanistan is not even generally indicated. Two years and three millions of francs are certainly not an extravagant estimate of the cost of time and money which would be required for preliminary surveys. The mere mileage of the proposed line offers no insuperable obstacle to M. de Lesseps's ambitious undertaking. The American Pacific Railway, which connects the coasts of the two oceans, is as long as the line from Orenburg to Peshawur, and it was constructed with extraordinary rapidity. If India and Russia were parts of the same dominion, and if Central Asia were a settled country or an uninhabited and fertile plain, the two enterprises would be in some respects analogous. It may be doubted whether the Pacific Railway would have been thought of if California had been a great rival Power, contending by constant advances with the Atlantic States for the possession of the valley of the Mississippi. The enterprise would have been still further complicated if the intervening space had been occupied, not by a few scattered bands of Indians and a handful of disaffected Mormons, but by fanatical and warlike races, equally hostile to intruders from any quarter. The traffic between San Francisco and New York or Philadelphia is enormously greater than the whole trade of Central Asia, and there is no commercial intercourse between India and Russia. During the late discussion on the merits of the Euphrates Valley Railway, it was shown that the transit of passengers and goods would probably be insignificant, and the Lesseps railway would be far less attractive and less convenient. Private and official travellers would have little inclination to traverse Northern Europe and Asia on their way to and from India; and it is hardly necessary to comment on the absurdity of sending troops for the defence of India through the heart of the Russian dominions.

As soon as the frontier of the Russian Empire or of its dependencies was reached, all trade from India would be effectually stopped by the protective tariff; nor is it probable that an English Railway Company would be allowed to control the route to Samarcand. However eagerly Russian journalists and statesmen may urge the repudiation of the understanding which was lately established between Lord Granville and Count Schouvaloff, any interference of England, even for pacific and commercial purposes, in the affairs of Central Asia, would be regarded with the utmost jealousy. It might indeed be thought convenient that the Indian Government should use its influence with the ruler of Afghanistan and the chiefs of the neighbouring districts to permit the construction of the railway; but an enterprise which involved the presence of English engineers and agents on the other side of the Oxus would provoke immediate protests. M. de Lesseps's proposal might be of some use if it induced the Indian Government to reconsider the questionable plan of constructing the Peshawur Railway on a narrow gauge; but it is not to be expected that a scheme which General Ignatieff describes as all but chimerical should enter as a serious element into the controversy. Even in civilized regions, railway projectors are in the habit of calculating either on local or terminal traffic, or more generally on a combination of both. There is at present no trade between Calcutta or Bombay and St. Petersburg, and the intermediate stations of Peshawur, Samarcand, or Orenburg, are not likely to be

fertile of traffic. The Russian Government may not improbably offer ostensible countenance to the project, for the purpose of throwing on England the responsibility of discouraging a beneficial enterprise; but, in fact, English Governments are invariably anxious to encourage trade, and the Russian frontier is almost hermetically sealed. When goods are allowed to enter Russia free of duty or at reasonable rates, it will be time enough to provide material facilities for commerce. Not even the most enthusiastic projectors can pretend that a railway through the centre of Asia is required for the accommodation of passengers. In this instance no country has any political motive for making the pecuniary sacrifice which would be involved in the construction of the railway.

For an industrial enterprise which can scarcely be recommended as profitable it was necessary to discover a more recondite reason, and M. DE LESSEPS is not unequal to the occasion. Although it scarcely seems to be the special duty of an eminent Frenchman to correct misunderstandings between two foreign nations, M. DE LESSEPS is bent on extinguishing the jealousy and antagonism between England and Russia, which he attributes to the present condition of Central Asia. That region "once traversed by railways, the "obstacles are removed to the eastward expansion of "European enterprise, and the two rival Empires are mu-"tually guaranteed against the aggression of the semi-"barbarous populations." European enterprise, as far as it is represented by England, has already expanded much further to the East, and it is not the business of English capitalists to find the means for the expansion of Russian trade, which would nevertheless not be unwelcome. By a mutual guarantee M. DE LESSEPS probably means a common security, but England and India have nothing at present to fear from the semi-barbarous populations of Central Asia. It is from a civilized Power, now actively engaged in subduing the semi-barbarous populations, that possible danger is apprehended, and any alarm which may exist would not be diminished by the establishment of a convenient highway for troops from Samarcand to Peshawur. General IGNATIEFF fully adopts in his answer to M. DE LESSEPS the mysterious theory that the antagonism between England and Russia results from the absence of railway communication between their respective territories. "We have to consider the "antagonistic spirit which the present unfortunate position en-"genders between England and Russia. Your scheme accom-"plished, all distrust and jealousy on either side must dis-"appear." It would seem to ordinary minds that Russia would be greatly troubled by distrust if Samarcand were the terminus of an English railway, although the Indian Government will certainly not attempt conquests in Central Asia. On the other hand, it would be out of the question to allow a Russian Company to construct and work a line as far as Peshawur. If either arrangement were conceivable, the two Foreign Ministers would be incessantly employed in negotiations for the avoidance of quarrels and the settlement of neutral zones. The benevolent aspirations of M. DE LESSEPS and General IGNATIEFF are much more likely to be realized under existing conditions in the probable event of the scheme being speedily and finally abandoned. There is not the smallest likelihood that capitalists will provide any fraction of the cost of the undertaking.

M. DE LESSEPS's philanthropic hopes are fortified by the success which he claims for himself in accomplishing a similar reconciliation between England and France. The Suez Canal was, it seems, devised for the purpose of terminating the rivalry for influence in Egypt which had since the beginning of the century prevailed between England and France. As M. DE LESSEPS truly says, the old antagonism has been materially abated; but he is the first author of the proposition that the change of feeling has been connected with the Suez Canal. Many English politicians agreed in the opinion of Lord PALMERSTON that the Canal would injuriously affect English interests, and M. DE LESSEPS adroitly profited by the hostile feeling of England to place the shares of his Company in France. It was a universal belief, not only in France, but in all the countries bordering on the Mediterranean, that with the opening of the Canal the trade of India and of Asia would be transferred from Liverpool and London to Marseilles, to Brindisi, and to Odessa. It was forgotten that to compete with great commercial ports a maritime town must have a market behind it; and that a hundred cargoes required freight at Liverpool for one at Brindisi or Odessa. It is also certain that the ocean trade depends largely on custom, on commercial skill, and on other qualities which are not rendered worthless by the opening of any canal. The enterprise had been supported by jealousy of England, and it was a severe disappointment to foreigners to find that English vessels passing the Canal greatly outnumbered all competitors. The Canal has been found useful and not injurious, but it is difficult to understand how it can have removed any feeling of jealousy on the part of France towards England. In case of war it would be necessary to fight for the possession, or at least for the neutrality, of Egypt. During peace the country which has the largest amount of merchant shipping will supply the principal traffic of the Canal. If the Canal is to be permanently efficient, it must be transferred into English hands, and the operation will probably be effected by the simple process of a gradual purchase of the shares. The stock of the Central Asia Railway to Peshawur will scarcely be saleable on the Stock Exchange.

ITALY.

THE final vote on the Religious Corporations Bill has been taken, and a majority of four to one has declared in favour of the measure. The resignation of the Ministry was not without its desired effect; and when it was found that no other Ministry could carry a Bill, and that no other Bill than that of the Ministry could be carried, the habitual shrewdness and moderation of the Italian Parliament easily induced it to bow to what was, to many of its members, an unwelcome necessity. There have been struggles and hot speeches, and some divisions; but, on the whole, the majority is probably satisfied with the measure, which is certainly not characterized by timidity or irresolution. It was decided by a narrow majority not to insert a provision altogether banishing the Jesuits out of the country; and on one other point there was a serious contest, but a majority of twenty-one supported the Government in accepting a reasonable compromise. The Government had proposed to recognize the existence of the Generals of the monastic orders, and of the corporations belonging to them; and this recognition was such as to insure their existence in perpetuity. These orders number fifty-two; and as in the rest of Italy monastic orders have no recognized existence, it was constituting a very striking exception that in the capital fifty-two monastic orders should be recognized in perpetuity. Not only the Opposition, but even many supporters of the Cabinet, viewed with the utmost alarm and disapproval so extreme a concession to the pretensions of the Papacy. The Bill and the Ministry were alike in jeopardy when Baron RICASOLI came to the rescue, and made a proposal which got the Government out of its difficulty. It must be confessed that the Ministry only retrieved its fortunes by deserting to a great extent the cause of those whom it had undertaken to befriend. The proposal was that the Generals should receive a pension of 16,000*l.* a year from the State, and that the present Generals should during their lifetime, if they remained so long in office, be allowed to occupy part of their present residences. The pension is to be handed over to the Holy See as an increase of the Pope's endowment, and, until the Vatican will accept the grant, a special board is to be constituted to apply it to the purposes to which it is destined. It is evident that the orders get something by this arrangement, but that what they get is very much less than what the Ministry propose to bestow on them. During the remainder of their lifetime the present Generals will have a home in such a portion of their residences as the State may be willing to relinquish to their use. But, as one after another of their heads expire the orders will cease to have a local centre, and their Generals must sink into the position of hangers-on of the Papal household. If the Papacy is reconciled to Italy, the Head of the Church will have at his disposal the not very considerable sum of 16,000*l.* a year for the maintenance of what has always been declared to be an indispensable part of the machinery of his government. Until this reconciliation is effected, this pittance will be doled out to the orders at the discretion of those whom they regard as their enemies and oppressors. It is a striking sign of the feelings and attitude of the Italian Parliament towards the Papacy that this arrangement has been sanctioned by a small and reluctant majority as a compromise almost too liberal in favour of bodies which ought properly to have nothing.

It is not surprising that the POPE should have been thrown into unaccustomed agitation by the decision at which the Italian Parliament has arrived. He reasonably hoped for better things. For many months the Italian Government evidently showed that it was somewhat afraid of him. The inconveniences of an open and enduring quarrel with the Papacy press upon those who are charged with the difficult duty of administering Italian affairs, and it may be remarked

that no one has been more forward in endeavouring to conciliate the Pope than Visconti Venosta, who has had greater opportunities than most Italians for considering the bearings of the religious question on the relations of Italy with foreign Powers. Until the decision was known the Pope was unusually mild, and affected to regard the leaders of Italian policy as good sheep who would never wander more than a little way from the true fold. Now that the worst is known, his spiritual wrath has been aroused, and he has broken out into his ordinary luxuriance of anathemas. He has devoted to the ruin they have invoked those who have once more dared to insult and rob him. But even in this dark hour of misfortune he has invented a theory which brings consolation to his aged and afflicted mind. He has persuaded himself that there are two Italies—the Italy of the faithful, the submissive, and the devout, and the Italy of the headstrong, the violent, and the unbelieving; and that the former Italy is numerically far the larger of the two. The good are kept down by the bad, and are for the moment overpowered by them; but they are really the stronger party, and will soon show what their strength is, will prostrate themselves at the feet of their good Father, and will work confusion on his enemies. The strange thing is that this theory should be to all appearances entirely unfounded. In all other Catholic countries where a contest is being waged between the Church and the State there is a strong clerical party in the bosom of a hostile Legislature. But in Italy, which is still undoubtedly Catholic in its religious sentiments, which is attached to the Papacy by a thousand ties of intimacy and tradition, and which would resent it as a distinct national grievance if the reigning Pope were not an Italian, there is no clerical party at all which can make its influence felt in the conduct of public affairs. There must be some reason for this, and the reason is probably to be found in the long hostility of the Papacy to the national aspirations of Italy. The Papacy has been the cordial ally of Austria and the grudging servant of France, but no living Italian can remember the day when the Pope was not willing to use the heel of the foreigner to trample on the hopes of Italy. The Papacy is everywhere influential in proportion as it has allied itself with the nation in which it is working. It is strongest in Ireland, where the cause of the people and the Church is the same; it is strong in France and Germany, where at least a numerous minority sees in the history of the Papacy something that is bound up with what is dearest to it in the history of its own country; and it is weakest in Italy, where Pope after Pope has been obliged by the force of circumstances to eat the bitter fruits of his temporal power, and to remain an alien to the fondest wishes of his kinsmen and fellow-countrymen.

Even if the Pope could see this, and could bring himself to acknowledge its truth, it is not to be supposed that at his age he would change his policy and alter the habits of a lifetime. But then the Pope may die, and his successor may see things in a different light, and it is therefore of extreme importance to Italy who this successor is to be. Europe has lately rung with the hourly intelligence that Pius IX. was at the point of death, and a medical paper has published with revolting accuracy a list of his diseases, which seem to the lay reader as if they must kill any one in the prime of life within twenty-four hours. Still the Pope lives on, and his protracted existence has enabled him to experience a pleasure which some old men would enjoy with the keenest delight. Lord Brougham is said to have adopted the coarse expedient of inventing a fatal carriage accident, in order that he might read his own obituary notices, and see what the world would say of so great a man when he was taken from it. The Pope has not been put to so much trouble. Impatient journalists, who took for granted that he must die, and had got ready their elaborate accounts of his life and policy, could not bear to see so much good matter wasted, and kindly allowed him to learn exactly what they thought of him. His fair beginning, his ignominious flight, his inordinate pretensions, his alternations of humility and anger were duly chronicled, and he could read what sort of a Pope current history would pronounce Pius IX. to have been. He has returned good for evil, and seems bent on living long enough to permit these effusions to be forgotten, and so to permit them to be reproduced without the necessity of change. But he is old and ill, and the end cannot probably be far off. The interest, therefore, which is felt in the appointment of his successor is not relaxed, and those who have the charge of nominating a new Pope have all their plans arranged. It is said that, after full discussion, it has been determined to appoint none but an Italian. The name even of his successor has been given, and it is rumoured that the Cardinal of Naples is the lucky man; but nothing can be more uncertain than such speculations. The events of the present week do not prompt much reliance on the chances of a favourite, and some unknown outsider may prove to be successful. The leading motive which has induced the electors to determine on appointing an Italian is said to be that of appointing a Pope who might seem naturally fitted to wield the temporal power when it is restored to him. The chief of the Roman States is not only the head of the Church, but an Italian prince, and it would be dangerous to call on his Italian subjects to bear among their other burdens the yoke of a foreigner. From this point of view an Italian is to be chosen because he will be best fitted to profit by the triumph of the Church when the destroyers of the temporal power are conquered; but then it is possible that this triumph may never be achieved, and stern necessity may teach the next Pope to postpone his dreams of being a King to a very distant future. In that case also it may be very useful that he should be an Italian, for he will then know the real feelings of his countrymen, and will comprehend the depth of the gulf which bitter memories have placed between them and the head of their Church. After the recent vote of its Parliament, it is impossible that Italy should hope to be reconciled with Pius IX., but it may look forward to the time when it will be reconciled with his successor, if he is a man capable of new thoughts and alive to Italian sympathies.

THE JUDICATURE BILL.

THE discussion to which the Judicature Bill has been subjected has brought the points in controversy within a very narrow compass, and the time seems to have arrived when it may be useful to sum up the questions which have been raised and the conclusions which have been attained. On the largest question of all, the propriety of merging in one Law of England the divided and often antagonistic doctrines of Common Law and Equity, it is satisfactory to find that scarcely any difference of opinion has been manifested. Lawyers and laymen have with one voice declared their sympathy with the avowed object of the Bill—that Law and Equity shall be concurrently administered, and that where there is any conflict of doctrine the rules of Equity shall prevail. To the Bill as framed it is true that weighty objections have been taken; but in every instance the complaint has been, not that the Bill does too much, but that it does too little; not that its principle is pushed too far, but that the machinery proposed, threatens to destroy the best part of the jurisprudence which we possess, without affording any guarantee for successful reconstruction on broader foundations.

After all that has been said and written upon the subject, it ought not to be difficult to determine how far these objections are valid and by what means they may be removed. Three main points have been raised on the part of the Equity Bar:—

1. That the judicial staff of the Equity Courts, already taxed beyond their strength, and compelled to delegate to Chief Clerks much of their proper work, will be unable, unless largely reinforced, to employ *vivâ voce* in place of affidavit evidence as required by the Bill.

2. That without a leaven of Equity-trained Judges the Common Law Courts will be unable to preserve unimpaired the principles of Equity Jurisprudence.

3. That the procedure sketched out by the Bill will not work efficiently, and may not improbably reproduce many of the evils of special pleading.

Nearly all the controversy up to the present time has turned upon the first two of these objections, and to these we propose to confine ourselves to-day. To the first no answer has seriously been attempted. No one has said that Judges ought to be forced to go on for ever delegating duties which they were meant to perform themselves, that a large mass of strictly judicial work should be left in Equity to Chief Clerks and Examiners, or that the whole judicial business of the London Court of Bankruptcy should be done by Registrars. No one has said, either that *vivâ voce* evidence can be introduced into the Equity Courts without a largely increased demand upon judicial time, or that the miserable system of ascertaining facts at present in force ought to be suffered to continue for another day. No one has said that it is right that causes should wait the greater part of a year for hearing as they often do now, or that it is reasonable to suppose that the number of Judges which was thought sufficient thirty years ago can properly dispose of business which has probably quadrupled in amount since then.

And unless these evils are to continue with constant aggravation, it seems essential that a large addition should be made to the Equity Bench. It is a wholesome thing to note that this necessity is frankly recognized by those who have spoken from the Common Law point of view. There has indeed been no answer suggested to the demands of the Equity Bar that will bear a moment's discussion, except that to make the Bench strong enough for its work will cost a certain amount of money. It will be for the House of Commons to say whether a grand scheme of Law Reform is to be shipwrecked for a petty saving.

Upon the second point there has been a little, but only a little, more show of argument. Not that any one has really grappled with the objection. It has been suggested, indeed, that the Courts would in course of time learn their new work, and that the evils of the proposed arrangement would not be so serious or so prolonged as the Equity Bar, from sad recollection of analogous experiments, unanimously believe. But this is at the most a mere plea in mitigation, for no one has denied that the administration of justice and the purity of the law must suffer, so long as the Bench remains weaker in special knowledge of the law which it has to administer than those who may practise before it. The Bench ought always to be stronger than the Bar, and it would be idle flattery to say that it can be so during the transition period when the Judges are expected to be learning a previously unfamiliar jurisprudence. No one, in short, has ventured to say that a tribunal composed exclusively of Common Law Judges is the best tribunal for the administration of Law and Equity combined. By common consent the best constitution of such a Court would be secured by associating Common Law and Equity Judges at the same time that Law and Equity are fused. Unfortunately the opinions of the Judges on this point, if ascertained, have not been made public; but it is impossible to doubt that they would sustain our view. But it is said again, You cannot give Equity colleagues to the Common Law Courts without making the complement of Judges redundant for the first year or two, and entailing a slight temporary addition to the national expenditure. This is undoubtedly true, and the same grave question arises as before, whether it is worth while to save a few thousands for a year or two at the cost of impairing the efficiency of our Courts of justice. We cannot persuade ourselves that it is the wish of the House of Commons to imperil such an experiment as the entire reconstruction of our judicial system for the sake of a trifling economy. It is right that all proposals involving new outlay should be scrutinized with proper jealousy, but, if they stand the test, as the proposals of the Equity Bar confessedly do, we cannot believe—whatever Ministers may say—that the country and the House will be willing, on grounds of parsimony, to accept anything less than the best tribunals which it is possible to secure.

We have dwelt upon this point because it is the real issue, and the only real issue which remains. Whatever doubts may have been entertained by some before the matter was sifted, whatever cavils may yet be reproduced to cloud the controversy, it is not now denied that Courts constituted as the Equity Bar have desired would administer justice more efficiently than the Courts which the Bill, as framed, proposes to set up. Lord HATHERLEY—differing in this very widely from Lord CAIRNS—has expressed more confidence in the versatility of the Common Law Bench than any other distinguished lawyer; yet even he acknowledged that to make the Bill work well it would be desirable to fill some early vacancies in the Common Law Divisions with Judges who have enjoyed Equity training. What is this but an admission that the constitution of the Courts proposed by the Bill is not what it should be? And if that is so, surely it must follow that the successful working of a measure which must either reinvigorate or destroy our jurisprudence ought not to be left to depend on the views about appointments which may happen to prevail in the unknown Cabinet of the future.

Whatever else the Bill does or leaves undone, it ought to secure from the outset the most efficient Courts which the country can supply. Any one-sidedness or weakness of the Courts in the early years of the experiment may generate evils which no amount of subsequent care will suffice to eradicate. It will be in the first years of the new system that the practice of the Courts will be formed and consolidated, and that rules will be made and precedents established, which, if strained, this way or that, for want of adequate familiarity with the subjects dealt with, may hamper and distort the administration of justice for whole generations. Even if Lord HATHERLEY's suggestion were acted on (and who can say that it would be?), it might very possibly begin to operate too late to avert the mischief which is not unreasonably apprehended. But then, on the other hand, two or three salaries or pensions might be saved during the intervening years, and to some minds this may possibly present itself as an adequate compensation.

One argument has been urged against the scheme of the Equity Bar which deserves far more consideration than any mere counting of money-cost. It is said that, if it is needful to add Equity Judges to the Common Law Divisions, it must be equally right to associate Common Law Judges with the Vice-Chancellors. The Equity Bar have not in their remonstrance touched upon this point, and we do not pretend to say what their feeling may be. But for ourselves we admit that the proposal is sound, though of course it is hopeless to press it while the Government insist that Equity Judges shall do single-handed the same kind of work for which Common Law Courts sit in banc. The right plan would, we believe, be to constitute each Common Law Division of two Common Law Judges and one Equity Judge, and each Equity Division of two Equity Judges and one Common Law Judge, making as many Divisions as the business might require. But this would be a far broader scheme than the Government has shown any disposition to adopt. The more limited suggestions of the Equity Bar are, we fear, quite as much as can be successfully insisted on, and, though less symmetrically perfect than such an arrangement as we have indicated, would cure most of the practical defects of the Bill.

For it is to be observed that while the Bill forces the Common Law Courts to deal with all Equities raised by defendants, and renders it absolutely necessary that they should be imbued with Equity knowledge, it does not compel any one, whether plaintiff or defendant, to submit a pure question of Law to a Court of Equity; and it is not likely that the Court of Chancery will require, under the new *régime*, to administer Common Law to any greater extent than it is already accustomed to do. There will not therefore be the same pressing necessity for such a modification of the Equity Courts as will exist in the other Divisions; and, greatly as we should rejoice to see a thoroughly comprehensive plan carried into operation, we may be content at present to avert the really serious dangers which the Bill seems to threaten, and to wait with patience for the future development of a more symmetrical scheme.

RAILWAY AMALGAMATION.

THE first and greatest of the Railway Amalgamation schemes has been summarily and finally defeated. The Joint Committee of Lords and Commons on Friday week declared, without hearing the opponents, that the preamble of the London and North-Western and Lancashire and Yorkshire Amalgamation Bill was not proved. The alliance between the two Companies was arranged in 1871, and the first Bill for uniting their interests was promoted in 1871. The scheme, although Parliament has refused to sanction it, has largely affected the course of railway legislation. All the Amalgamation Bills of last year were referred for purposes of preliminary inquiry to a Joint Committee selected from both Houses. The Committee collected a voluminous mass of information which scarcely deserves to be called evidence, inasmuch as it was delivered in the absence of opposition, and as it was therefore not tested by cross-examination. All the railway managers and half the railway theorists, took the opportunity of urging on the Committee their respective doctrines; and it is not surprising that the Report contained more than one marvellous statement which had been communicated to the Committee in a well-founded confidence that it could not be contradicted on the spot. On the whole the Committee inclined to favour the principle of amalgamation, having been strongly impressed with the notorious fallacy that permanent railway competition was impossible. With curious inconsistency, the Committee insisted on the expediency of maintaining the comparatively trifling competition between canals and railways. It is strange that they should have fancied that an unequal contest could be sustained when they were convinced that an equal struggle was impracticable. The inquiry having been prolonged far into the summer, it was impossible to proceed with the Amalgamation Bills during the Session. The Committee recommended that the Government should introduce a measure for the appointment of a Railway Tribunal in place of the Court of Common Pleas, and for the purpose of railway arbitrations; and that Amalgamation Bills should in future be referred to a Joint Committee. Both

suggestions have been accepted by the Government, and adopted by Parliament. The Railway and Canal Traffic Act, by which three Railway Commissioners are invested with the control of railways, provides for the more effectual execution of the provisions of Mr. CARDWELL'S Act of 1853. The Commission is empowered to fix, under certain restrictions, through rates on routes compounded of the lines of different Companies, and to enforce the concession of ordinary facilities for the conduct of traffic. Experience will show whether external authority can materially control railway administration. It is possible, but not certain, that the establishment of a permanent tribunal may render arbitration cheaper and more speedy.

The reference of Amalgamation Bills to a Joint Committee was the perverse result of a singular illusion. It seems to have been supposed that a Committee of three peers and three commoners would in some unintelligible manner be superior to a similar body selected from a single House. While ordinary Bills are subjected to a double investigation by two successive Committees, it was thought that more important measures should be decided on a single inquiry. If the London and North-Western Amalgamation Bill had been passed by the Joint Committee, the opponents would have had much reason to complain of the want of provision for a new trial. As the defeat of the measure by a Committee of either House would have been final, no practical inconvenience has resulted from an irrational arrangement. The Joint Committee was fairly selected; and it is equal in competence to an ordinary Committee of the House of Commons, or of the House of Lords. The decision, though it may probably have been sound, had not been generally anticipated. The great trading communities of Yorkshire and Lancashire took no part in the contest; and some of the Companies which would have been injuriously affected by the proposed monopoly offered but a faint opposition to the Bill. The policy of great Companies is by the necessity of the case so complex, and their interests are so various, that it seldom suits them to maintain for contentious purposes any broad or comprehensive proposition. They are always connected by agreements and alliances, as to some parts of their respective systems, with opponents against whom they are elsewhere maintaining the bitterest competition. It is often inconvenient to denounce the principle of arrangements to which they entertain the strongest practical objection, because the opponents may in their turn require analogous privileges for themselves. Those who enjoy strict local monopolies are debarred from using the most obvious arguments against the amalgamation of competing lines; and it sometimes happens that the amalgamating Companies can offer concessions which compensate their neighbours for the loss of independent communications. The London and North-Western scheme was so considerable that there still remains after all deductions a formidable mass of opposition. Though amateurs are easily deluded by sonorous platitudes, no railway administrator believes for a moment that the withdrawal of competition is inoperative or worthless. The amalgamated Company would have received one-third of the entire traffic revenue of the kingdom.

As the Committee abstained, in accordance with custom, from announcing the grounds of the decision, it is not known whether the London and North-Western Bill has been rejected for special reasons, or because the opinion of the Committee is adverse to the principle of amalgamation. In all discussions of such measures the Railway and Canal Traffic Act will for some time to come furnish both parties with plausible arguments. The promoters of amalgamation will more or less seriously contend that outside Companies are sufficiently protected by the general law; and on the other side it will be urged that all the convenience which might be secured by actual union will be not less effectually provided by the statutory interchange of facilities. Prudent legislators will attach little value to conjectural deductions from the language of the Act. Railway managers, who possess an almost exclusive knowledge of their special business, are well aware that the control of traffic depends mainly on conditions which will be little affected by any Act of Parliament. Legal facilities, like arms of precision in warfare, will add to the relative strength of the party which was already stronger while the contest was waged with ruder weapons. A large and wealthy Company will control a petty neighbour more effectually than before, when it has the power of enforcing the adoption of the rates and the routes which may suit its convenience. The traders who immediately direct the course of traffic will prefer the Company from which they have most to hope or to fear. The course of Southward traffic will not unfrequently be determined in accordance with the interests of the Company which can best accommodate the more important trade which passes to the East, the West, or the North. If the London and North-Western had been incorporated with the Lancashire and Yorkshire, it would have been useless for an independent Scotch Company to canvass in the great manufacturing districts for any traffic which the amalgamated Companies might think fit to direct by another route.

Notwithstanding the defeat of the Bill, the alliance which it would have consolidated exists, nor can it be dissolved by any action of Parliament. The public advantage of nominal separation consists in the possibility that a non-legal union may hereafter be dissolved. In the prospect of such a contingency, both Companies have a motive for maintaining an efficiency which may be available for future competition. Against the monopoly which in the meantime exists, the only security is to be found in the vigorous competition of the great rival Companies. The Great Northern, the Midland, and the Manchester, Sheffield, and Lincolnshire Companies have, while complacent theorists were proclaiming that competition was impossible, spent several millions in promoting a competing line from the East into Liverpool. The Midland has, at enormous expense, established a competing route to Carlisle and to Scotland, and a scheme is now before Parliament for a competing line from Hull to the West Riding and the districts beyond. It is fortunate for the liberties of the commercial community that railway potentates maintain with restless activity the balance of power. The Joint Committee has prevented one violent derangement of the equilibrium. It will deal with an entirely different question when it considers proposals for amalgamations in the nature of extensions. To amalgamate sideways and to amalgamate lengthways are operations of an entirely different character. As a general rule, parallel lines while they are reciprocally independent compete, while continuous lines are worked in a common interest. The test of expediency is in either case the question whether amalgamation tends to prevent or to encourage competition. If the line from London to Tunbridge belonged to one Company and the line from Tunbridge to Dover to another Company, the amalgamation of the component parts of a through line would be obviously desirable. It is also for the most part advisable to merge isolated lines in great systems, with which they would in any case be incapable of competing. The Joint Committee of last year arrived at the sound conclusion that every case must be decided on its merits.

THE CHIPPING NORTON RIOTERS.

ALL reasonable people must agree that the magistrates at Chipping Norton who sent the women to prison the other day committed an act of rash and injudicious severity; but it is desirable that the case should be disentangled from the somewhat large conclusions which have been drawn from it. In itself the case is a very simple one. The labourers in the employment of a farmer named HAMBRIDGE struck for an advance of wages. Mr. HAMBRIDGE brought a couple of men from a village a little way off to work on his farm, and one day these men were met as they were going to the fields by a band of women whose husbands were out on strike. The women first tried to induce the men to desert their master, and then, it is alleged, threatened to bar their entrance to the field. Some of the women, it is said, carried sticks, and they used menacing language and gestures. The men declare that they were afraid of personal violence, as the women out-numbered them and behaved in a furious manner. At any rate the men returned to their master, who sought the assistance of a police constable, and under this escort sent them back to their work. As is usual in such cases, there is a conflict of evidence, but there seems to be no reason to doubt that the women were guilty of intimidation. It has been suggested that it was only a lark on their part, but jokers of this kind must not be surprised if their jocosity is misunderstood. It is certain, however, that no actual violence was used towards the men. Seventeen women were prosecuted before the magistrates, and sixteen of them were convicted of having been guilty of intimidation under the Criminal Law Amendment Act—that is to say, of intimidation such as would justify a Justice of the Peace, on complaint made before him, in binding over the persons threatening or intimidating to keep the peace. We see no reason to doubt the justice of this conviction. The women had evidently gathered together for a purpose, and that purpose may be inferred from the position they took up at the entrance to the field as well as from their lan-

guage and gestures. It is significant that their husbands should have kept carefully out of the way. It was known that Mr. HAMBRIDGE was a resolute man who was prepared to take full advantage of the protection accorded to employers by law, and the men on strike were probably warned by the Unionist agents that they would get into trouble if they molested the new comers. It is difficult to resist a suspicion that the women were put forward because it was thought that the law would not be enforced against them, and that in any case they might be exhibited as interesting victims. However that may have been, it cannot be seriously argued that women are to be allowed to break the law with impunity. Mr. HOLLOWAY, the Chairman of the Oxford District of the National Agricultural Labourers' Union, thinks it very hard that "poor women" should be punished "for what appeared "to them no offence at all." The women, he adds, had no idea that such a law existed as was brought to bear on them. It appears to us that, if the women thought that intimidation by numbers and violent language was not an offence, it was highly desirable that their ignorance on this point should be removed. It is clear that the Unionists knew that the law had been broken and expected a conviction, for one of them attended the Court with money to pay the fines, which he supposed would be exacted. Under the circumstances the magistrates had no alternative except to convict, and the only question is as to the propriety of the sentence which they passed on the offenders. They sent nine of the women to prison for seven days and seven for ten days, with hard labour in each case. This must strike every one as exceedingly severe. Some of the women had infants at the breast; most of them had young children at home. The farmer's men had not been subjected to actual violence; they had only been threatened; and it would surely have been enough in such a case to have met threat with threat, and warned the women that, if they attempted anything of the sort again, they would suffer for it.

The severity of the magistrates of course affords no justification for the violence of the mob, who at night stormed the police-office and endeavoured to rescue the prisoners. On Tuesday nine of the women were released at the end of a week's imprisonment, and their hard labour is said to have been of the lightest kind. During their absence their children were taken care of by the neighbours in a highly demonstrative manner, "the deserted little ones, to the number of a "score and over," being "fed on the village green, under the "shadow of the spreading chestnuts"; and it will be understood that the Unionist leaders are quite aware of the use which may be made of the injudicious enforcement of an Act which interferes very much with their favourite practices. Mr. BRUCE was questioned on the subject in the House of Commons, but up to Tuesday night he professed to be still officially ignorant of what had happened. He added that in cases of this kind it was not his custom to wait for questions in the House before interfering; but it is difficult to know what else there was to wait for. The women were sent to prison on the 21st; on the 23rd Mr. HOLLOWAY'S letter appeared in the *Times*; on the 26th the *Times* published the results of a careful inquiry by its own Correspondent; yet up to the 27th the Home Office remained in absolute ignorance of the whole affair. Mr. BRUCE is perhaps not aware that Chipping Norton is within two or three hours' journey from London. It is very unfortunate that this case should have occurred, and that we should have a HOME SECRETARY who can never shake himself awake on any subject in less than a week; but, after all, we do not see that there is much more to be said about the matter, except that, in spite of all precautions, Acts of Parliament will occasionally be enforced with undue severity as well as with undue leniency. Magistrates are only men, and they are liable to make mistakes sometimes on one side and sometimes on the other. They certainly made a mistake in this instance, just as, in the opinion of most people, Mr. Justice BRETT made a mistake in the case of the gas-stokers. It is of course a great pity that such mistakes should ever be made, but it does not necessarily follow that because a couple of justices have committed a blunder the Criminal Law Amendment Act must at once be repealed, the unpaid magistracy abolished, farm-labourers' wages raised to fourteen shillings a week all round, and all large farms cut down to suit the supposed necessities of peasant proprietors. Yet these are some of the conclusions which are put forth as naturally arising out of this case.

The *Daily Telegraph* hints that it would be satisfied with the abolition of unpaid justices. The *Daily News*, hesitating between a "world-wide circulation" and fidelity to narrow and rancorous sectarianism, is glad of an opportunity of for once pandering to both, and has its fling at squires and clergymen alike. It is suggested that squires are willing to give up a day's shooting for magisterial duty only when there is a poacher to be sent to prison, and that the "parson" relishes a chance of coming down heavily on poor labourers or labourers' wives. The organ of philosophical Radicalism, however, is evidently prepared for larger measures. Its Special Correspondent denounces the Chipping Norton farmers because they do not see, in the fact that they have lately raised the labourer's wages from ten to twelve shillings a week, a reason for immediately giving him two shillings more. He also makes some suggestive remarks on the luxury and sybaritism of modern farmers:—"The farmhouse now is a "fashionable mansion, innocent of flitches and black rafters; "the comfortable gig has been succeeded by a smart drag "and men in livery; the farmer no longer mounts the rick, "or leads the rank at harvest-time." The Correspondent has come to the conclusion that Oxfordshire farms are "much too "large." We may expect to see all this reproduced in the *Labourers' Union Chronicle*, which has already by anticipation pointed the moral in an extremely plainspoken manner. We are assured by that journal that, if the farmers were to get the better of the Union, the result would be "signalled by mid-"night surprises, by beacon fires from one end of England to "the other," and that the Unionists would "feast upon re-"venge and glory in anarchy." It might have been supposed that the Union would have been eager to clear itself from any suspicion of complicity in these incitements to arson and rapine; and at the annual Conference on Wednesday Mr. DIXON, the chairman, felt bound to protest against them. A resolution, however, was actually proposed, "praising the *Chronicle* for its services to the cause"; and though the delegates did not venture to proclaim openly their sympathy with the incendiarism of their organ, they significantly refrained from condemning it. Of course, the Conference demanded the repeal of the law against intimidation, and the appointment of stipendiary magistrates all over the country. A moment's reflection will show that there is no necessary connexion between the injudicious severity of the magistrates in this case and the Act against which it has been caught up as an argument. An Act of Parliament cannot prescribe specifically for every set of circumstances that can by any possibility occur; a margin must always be left for judicial discretion, and judges are not invariably discreet. The definition of offences in the Act may perhaps be open to improvement, and if any better definitions can be suggested, by all means let them be considered. But what the Unionists desire is not the amendment, but the repeal, of the statute. There can be no question, however, that the violent behaviour of the women at Chipping Norton was a form of intimidation which cannot be tolerated; and it is conceivable that, if the Act had not been in existence, this intimidation would have been practised by the male Unionists themselves without much mercy to the intruders.

Incidentally this case has thrown some light on the actual condition of agricultural labourers in Oxfordshire. Within a short time the farmers have added a couple of shillings to their weekly wages, and from the farmers' point of view it is not perhaps violently unreasonable that there should be at least a pause in the continuous rise of wages. It appears that the Union has within a short time collected from 150*l.* to 160*l.* in this district, and the labourers therefore cannot be quite so destitute as has been represented. The farmers must have left something on them when there were such good pickings remaining for the benefit of Union agitators. Not long since the *Labourers' Union Chronicle* published a pathetic description of the case of a shepherd who had to keep himself, his wife, and eight children on thirteen shillings a week. Inquiry was made, and it turned out that this man had been receiving 70*l.* a year, besides parish relief for his wife and children; and that the members of his family had been augmented by his recent marriage with a young woman who had three illegitimate children. It is satisfactory to know that for some years past the condition of the agricultural population has been generally improving, and it is natural that, in the present state of the labour market, it should continue to improve. But it may be doubted whether the labourers have fallen into the hands of wise counsellors, and whether the tactics of the Union really tend to promote the permanent interests of the class whom it has taken under its somewhat dangerous protection. In other days Captain SWING did not enjoy the advantage of an organ in the press kept up by the subscriptions of amiable philanthropists.

THE PAPACY.

A REMARKABLE article with the above title appeared in the *Pall Mall Gazette* a few days back. Its object might, we conceive, be summed up in its own words—namely, to show that there is not in "the Papacy" or in "the Roman Catholic Church" any "element of power peculiar to itself, and generically different from those which are common to all human institutions," and that "its power is rapidly coming to be a mere power over the imagination." "No one feature in the history and character of the Roman Catholic Church can be mentioned which cannot be paralleled from the history of other creeds." The instances chosen for illustration are "its extreme persistency, its power of adapting itself to various circumstances of climate, race, and civilization, the vigour with which it produces revivals and grows up again in countries from which it had been expelled." We are told that it shares all these qualities with other religions, especially with Buddhism and Mahometanism. Now there is a great deal of truth in all this; but we must look somewhat further. What is meant by "the Papacy"? What is meant by "the Roman Catholic Church"? At the first blush of the matter we can see that, whatever we mean by it, the Roman Catholic Church is only one form of Christianity among several, and it seems hardly fair to balance one form of Christianity by itself against all forms of Mahometanism grouped together. The writer says, "As to unity of faith, the Roman Catholic religion has been divided by ten controversies where the Mahommedan religion has hardly been divided by one." It is not very clear whether the writer refers to controversies which have had the effect of separating men from the communion of Rome or to controversies which have gone on within the communion of Rome without leading men to separate from it. Of this last class there have been a good many among both Christians and Mahometans, but we cannot undertake to fix the exact proportion to be found in the two religions. Of controversies which have led to complete separation, surely the great separation between Shiahs and Sonnites may be fairly set against any one of the great schisms in Christendom, whether we choose to set it against the division between the Eastern and Western Churches or against the later revolt of Northern Europe against the supremacy of Rome. As being primarily a dispute about government, about the rightful headship of the religious society, the distinction of Shiahs and Sonnites has more in common with either of these two great divisions among Christians than it has with those earlier and more purely theological controversies which separated Nestorians and Jacobites from the orthodox Church. These last turned purely on points of dogma, except so far as we may hold that the half-unconscious national feeling of Syria and Egypt took the form of a theological revolt against the dogmas of the Church, because the time had passed for a political revolt against the dominion of the Empire. But the separation between East and West, the separation between Roman Catholic and Protestant, was primarily, like the separation between Shiahs and Sonnites, a question as to headship. Both disputes took a theological turn, but we may suspect that, if there had been no question of authority between the Old and the New Rome, the theological dispute as to the double procession would somehow have been got over. The Reformation too began in a revolt against the practical abuses of the Papal authority, which led, as a second stage, to an examination of the dogmas which men were called on to receive on the strength of that authority. So the Shiah form of Mahometanism has gone off into real theological differences from the orthodox Sonnite, but the dispute began with the question whether Abou-bekr, Omar, and Othman were lawful caliphs. But, as we are not clear whether the writer is thinking of great separations like these or of disputes, like that about the Immaculate Conception, which have not led to the foundation of distinct religious bodies, we want to know exactly what is meant by "the Papacy" and by "the Roman Catholic Church," and whether by those two phrases we are to understand exactly the same thing or not. The Papacy would seem to mean the dominion of the See of Rome over the Church in general or over such parts of the Church as choose to acknowledge it. It is rather an idea, an abstraction, a form of government, while the Roman Catholic Church can only mean a society of men—a society of men, it may be, which admits a particular form of government, but still the society itself as distinguished from the form of its government. It is plain that the characteristics of the history of the society will not depend wholly upon the form of its government, but upon the form of its government and certain other things taken together. The history of the Papacy as a form of government, and the history of the Roman Catholic Church as a society of Christians who admit that form of government, are two different things. In the former we have to look at the character of the form of government only, in the latter we have to look to other things as well. We must remember that we are dealing with a body of men who, besides their submission to a particular form of government, also hold certain strictly theological dogmas in common with other Christians, and certain other theological dogmas in which they differ from other Christians.

We hold then that it is hardly fair to compare the Roman Catholic Church or religion by itself with the various forms, or even with the two great forms, of the Mahometan religion as a whole. The comparison should rather be between the body of Roman Catholic Christians and the body of Sonnite Mahometans; and, if by the Papacy is meant strictly the form of Papal Church government, the proper thing to compare with it would be, not the Mahometan religion in general, but the Caliphate. If we are to compare the history of the Roman Catholic form of Christianity with the history of all forms of Mahometanism put together as a whole, we must make up our minds as to how much in the history and characteristics of the Roman Catholic Church is common to it with other forms of Christianity, and how much it has all to itself. We must further make up our minds what we mean by the words Roman Catholic Church, if we choose to use that formula at all. We do not know whether under the Roman Catholic Church the *Pall Mall* writer means to take in all the Churches of the West up to the time when the Papal authority was first seriously questioned in the West, or whether he means to confine the name to those Churches which have adhered to the Roman doctrine and the Roman discipline since they have been called in question in the West, and since they have been put forth in a more definite and controversial shape by the Council of Trent. It is manifest that there is a great difference between the position of an Englishman in the thirteenth century, who had not doubted at all about the dogmas which were called in question in the sixteenth, who accepted them without hesitation in the vague form in which they existed in his own time, and who in truth had never thought of the possibility of believing anything else, and the position of a man who nowadays accepts the same doctrines in a more rigidly defined shape, knowing, or at least having the opportunity of knowing, that there are large bodies of Christians who have deliberately cast them aside. There is a wide difference between the position of such a thirteenth-century Englishman, who grumbled perhaps because the Pope took so much money out of the country, but into whose head it had never come to doubt that the Bishop of Rome was in some way or other the rightful head of the Universal Church, and the position of a man who nowadays deliberately accepts a defined doctrine of Papal supremacy—whether that doctrine be Gallicanism or infallibility—while knowing that large bodies of Christians who at least have something to say for themselves have deliberately cast aside every doctrine of Papal supremacy in any shape. There is an exercise of choice, there is a definiteness and fixedness of position, in the latter case which there is not in the earlier. We have no right to assume that all who accepted the position in which they found themselves before it had been called in question would have deliberately chosen that position after it had been called in question. We may suspect that a man like Matthew Paris, who thought the Pope a great practical nuisance, but into whose head the idea had never come of casting him aside theologically, would in the sixteenth century have been, if not a doctrinal Protestant, at least one ready to join with Henry, Gardiner, and Bonner in throwing off all submission to the Bishop of Rome. Before then we can compare the Roman Catholic Church with Buddhism, Mahometanism, or anything else, we must know whether by the Roman Catholic Church is meant vaguely all the Churches of the West, allowing for the falling off of some of them for three hundred years past, or whether it simply means that sharply marked religious body which took its present form at the Council of Trent.

If for the Roman Catholic Church we substitute the writer's alternative phrase of the Papacy, we can more easily make something like the comparison which is made in the article. We can compare the Papacy, as the form of government of a religious society, with the Caliphate as the form of government of another religious society. There have been endless opinions as to the exact measure of power which ought to belong to the Bishop of Rome, even among those who did not doubt for a moment that some special powers ought to belong to him. But the fact that the Bishop of Rome has for ages claimed to be of right the head of the Universal Church, that for a long time he was practically the undisputed head of the Western Churches, that he still remains, both practically and as a matter of faith, the head of a large part of the Western Churches, is one of the great and leading facts of history. The fact that there was once a time when a single potentate, the Caliph of Mahomet, ruled, both with temporal and spiritual power, at Samarcand and at Cordova, that there has ever since been some one who has claimed to be the lawful successor of his spiritual power, and that for the last three centuries and a half that vague spiritual claim has been annexed to one of the great monarchies of the earth, is another of the great and leading facts of history. And those two facts may very well be compared together. And we think that such a comparison will show that there is, as Lord Macaulay seems to have thought, something special about the Papacy, which has no exact parallel in any other human institution. As the *Pall Mall* writer says, "Of the Roman Catholic view of the subject we need not speak." That is to say, we need not discuss the theological proposition that the supremacy of the Bishop of Rome is not merely something which has come in the ordinary course of Divine Providence, but is something which is of Divine right in a sense in which other things are not of Divine right. But the history of the Papacy is part of the history of Rome, and the history of Rome is something which is utterly without a parallel. We might even say that the history of the Papacy is that part of the history of Rome which is most utterly without a parallel. In a more human way of looking at things—or rather in a way which looks on all things as divine, but not on one thing as being more divine than another—the Bishop of Rome came to be the head of the Church because he was Bishop of Rome. As Christianity was essentially the religion of the Roman Empire, the organization of the Church followed the organization

of the Empire. The Bishop of the Old Rome took the first place; the Bishop of the New Rome took the second. But the Bishop of the Old Rome became an independent power, because, from Maximian to Francis the Second, the Emperor of the Old Rome was commonly away from his capital. The Bishop of the New Rome could not become an independent power, because, from the first Constantine to the last, the Emperor of the New Rome was commonly present in his capital. As a fact Rome always has ruled, but the ruling power has been sometimes the Imperial, and sometimes the Papal, power. When the Empire has been strong under Justinian, Charles the Great, Henry the Third, or Charles the Fifth, the Papacy has had to do pretty much what the Empire bade it. But Rome has ruled in either case. She has always been the centre of an Œcumenical power, of a power such as both the Empire and the Papacy were in theory, a power not shut up within the boundaries of any particular nation, but reaching wherever the two lights could shine and the two swords could smite. Rome has been an Œcumenical power down to our own day; it remains to be seen whether she can remain an Œcumenical power any longer. No heavier blow could be dealt to her Œcumenical character than the change which has just made her the capital of a local kingdom. The Rome of Victor Emmanuel is a falling back from the universal Rome of Cæsars and Pontiffs to the local Rome of the Kings and early Consuls. What is to become of the other element of the Roman idea, what is to be the fate of the other light, of the other sword, perhaps we may know better before long. But if Rome from this time onwards simply holds the position of any other European capital, its history up to this time will still be something which has no parallel. Rome stands out in the history of the world without a fellow, and the Papacy, as one of the great elements of the abiding greatness of Rome, stands out without a fellow also.

The Mahometan religion, as we have said before, ought in fairness to be compared, not with one form of Christianity only, however great and famous, but with Christianity as a whole. But if we compare the particular institution of the Papacy with the particular institution of the Caliphate, the Caliphate will surely cut a very poor figure. The Caliph, the successor of the Prophet, was Pope and Emperor in one, but he was Emperor because he was Pope. For a moment his authority, temporal and spiritual, stretched over a dominion almost surpassing that of Rome herself. But it was only for a moment; the dominion, both temporal and spiritual, broke in pieces. The state of things which was to be seen for a short time in Western Christendom in the days of the Great Schism has been the normal state of the Mahometan world. The Caliphate became a mere name; its bearer became an abject dependent upon the rulers of Egypt. Since the days of Selim the Ottoman Sultans have claimed to be the lawful holders of the office; but it is plain that in their hands the temporal power comes first and the spiritual second. The Caliph is no longer Emperor because he is Pope; he is Pope because he is Emperor. The phenomena of the history of Mahometanism are quite as remarkable as the writer to whom we have referred makes them out to be. But we say again that the particular comparison which was drawn out was not a fair one. The Papacy, we maintain, has a character of its own, which stands quite by itself among human institutions; and it does so, we believe, because it is part of that great Roman power which stands alone by itself in history, as being in truth the centre of all history.

HORSE-RACING AND MORALITY.

UNUSUAL vigour has lately been displayed in discussing the question of the proper limits of State interference with individual action. How far and on what grounds are we justified in any case in suppressing practices which may be injurious, but of which the evil effects are felt exclusively, or at least primarily, by the evildoer? The popular doctrine, most forcibly expounded by Mr. Mill, that nobody should interfere with anybody else except for purposes of self-protection, has been challenged, and its validity peremptorily denied. Upon the general moral question we do not propose to say anything at the present time; but it may be interesting to consider a particular case which is to some extent a good illustration of the wider principle. A very large section of the population thoroughly disapproves of horse-racing. Although many thousands of human beings have been to Epsom Downs this week to see which of half-a-dozen animals could run the fastest, a great many more have stayed at home; and no small number are of opinion that the holiday-makers have been at least tacitly encouraging a practice which increases the frivolity and saps the honesty of all who indulge in it. At present there is no agitation for suppressing an amusement which, if this view be well founded, is a grave national scandal. The most extreme measure proposed is that the House of Commons should not honour the performance by adjourning expressly in its favour. But, if the principles adopted in other cases are applied to this, we may expect in no long time to see a proposal for more vigorous action. Many people propose to put down drinking by Act of Parliament. Gambling-houses are already illegal, though gambling in all but certain narrowly defined cases can be carried on without danger of interference. It would be merely a question of detail to apply the same theories to horse-racing. If men are forbidden to gamble with dice in a hell, they may, on the same grounds, be forbidden to gamble with horses on an open down. Probably this inference will be drawn in a short time by the most advanced zealots; and as we grow steadily more decorous, if not more virtuous, we shall be asked to put down an amusement which already offends the straitlaced and excites the contempt of the truly cultivated classes. Let us ask, then, what kind of defence might be set up by the faithful few to whom the Derby will still be the most solemn observance of the year.

We may summarily dismiss the good old breed-of-horses argument. Whether with or without foundation, it is not desirable to produce quicker horses by a method which also produces horsier men. It may be a good thing to have a number of Gladiateurs, but we don't want any more specimens than are inevitable of touts, prophets, and the whole race of hangers-on to the Turf. The apologists of the Derby may of course argue that on the whole horse-racing is a harmless if not an ennobling amusement. They must give up the sporting-man pure and simple; for there is hardly an uglier variety of the human species on earth than the betting-book in-breeches, who combines the cunning of a civilized being with the intellectual apathy of a savage. The genuine old British sportsman is a person, however, not quite improved off the face of the earth, though he is perhaps more abundant in the imagination of penny-a-liners than in real life. But, granting his virtues, it will still be hard to prove that they are in any degree fostered by the amusement. Can it be seriously argued that any man is really the better for acquiring a taste for the Turf? Would any sensible father be glad to hear that his son was becoming more learned in the genealogy of horses than in art or literature? A love for healthy exercise, such as is implied in a passion for field sports or athletic games, is in itself a good thing, though frequently pushed to extremes. But if such a taste is combined with a taste for horse-racing, it is combined only in the sense in which a spirit of adventure may lead to a taste for rash speculation. The virtue, if we may dignify it by that name, perhaps passes into the vice by imperceptible degrees, but horse-racing is, to say the best of it, at the lowest end of the scale of which manlier forms of amusement are at the head. Considering how much is now at stake which once appeared to be perfectly secure, and how important it therefore is that the richer classes should take a generous view of their duties, nobody, when the question is fairly put to him, can seriously admire an amusement specially devised for the waste of time, money, and energy. If our governing classes are to hold their place at the head of society and to meet like men the dangers to which all existing institutions are exposed, they must be on their guard against those qualities which horse-racing is specially adapted to stimulate. A century ago, perhaps, they might be as frivolous as they pleased; they might try to kill the great enemy, Time, by gambling at their Clubs and at Newmarket, and nobody would think of regarding them as anything but spirited gentlemen, enjoying themselves in a manner appropriate to their rank. At the present day they are more jealously watched; they should prove that they are capable of employing for public-spirited ends the great influence which they still enjoy. A certain part of the population undoubtedly retains a kind of traditional respect for all forms of extravagance, and even an excessive devotion to horse-racing is considered as adding a certain aristocratic grace to the character of a social magnate. But the sentiment is not one upon which much reliance can be placed. In the struggle for existence which is always continuing in a more or less covert form, those classes will have the best of it which can make themselves most indispensable. If every racehorse were sent to the knackers to-morrow, if Tattersall's were shut up and the course at Epsom sold in building lots, the world would rub on about as well as before. There would, on the other hand, be an irremediable loss if English gentlemen lost the sense of honour, the public spirit, or the intellectual cultivation which, with all their shortcomings, enables them to play an important part in every agency for the national improvement. If society is, in some sense, on its trial, which indeed is always more or less true, horse-racing encourages precisely the qualities which must tend to demoralize and enervate the class with which it is popular. That it has any good effects upon individuals, that any human being is really the better for going upon the Turf, is a proposition too audacious to be seriously maintained by its advocates.

The disciple of Mr. Mill might possibly go on to urge that it is a "self-regarding" amusement. Those only who indulge in it are the worse for it, and nobody else has any right to protest. The fact asserted is so far true, that horse-racing does no immediate injury to the outside world. The horses do not tread upon our toes in a literal sense, and the worst physical evil produced is an occasional overcrowding of our streets and a certain amount of cruelty to animals. But, admitting that, in a technical sense, the evils of the practice are confined to those who take part in it, the case is one of those which illustrate the frequent inutility of the distinction. A horse-race does not necessarily involve broken heads, or other tangible and assignable physical injuries. But its deleterious influences on the population are not for that reason the less plainly marked. Anybody who looks at the advertisements of sporting newspapers may collect ample proofs that it encourages reckless gambling amongst large classes. We have agreed, for reasons too familiar to be stated over again, that lotteries were essentially demoralizing; but, though we have no longer State lotteries, we allow this great national lottery or system of lotteries to be carried on upon a vast scale. Nobody denies the mischiefs which resulted from the first practice; and it is impossible to see how their existence can be consistently denied in the other. In fact, their existence is not seriously denied by

anybody; but, if admitted, it follows that the plea founded upon the supposed limitation of the evil influences is nugatory. Horse-racing, with the surroundings which are now inseparable from it, encourages young men in ruinous habits; it is as distinctly an agency for evil amongst others besides its immediate supporters as the gambling-houses or the immoral exhibitions which are most righteously suppressed, or as any nuisance which spreads fever through a neighbourhood. A habit of gambling is as distinctly an evil, whether it is or is not as great an evil, as the physical consequences which result from breathing bad air. Horse-racing spreads the habit, as distinctly as inefficient drainage spreads atmospheric poison. The argument derived from the limited sphere of the evil holds or fails in both cases alike. If a few gentlemen raced their horses in their own grounds with no spectators or reporters, or if a man chose to keep an open cesspool in his own house in a solitary island, it may be that nobody would in either case have a right to interfere; but when a whole nation interests itself in the race, and a whole town can perceive the effluvia of the cesspool, the argument from individual liberty is equally illusory. However much we might desire it, we cannot safely treat human beings as though they were isolated individuals, when in fact every action spreads its influence through a sphere of indefinable extent.

Another argument from the same source is occasionally used. It is objectionable, it is said, to impress a uniform code of conduct upon a whole nation. We should desire to cultivate the greatest possible variety of types of character, and therefore to have jockeys and betting-men as well as lawyers and students of science. There are, however, two difficulties in the way of accepting this doctrine. In the first place, we may deny that the variety is a desirable one to preserve. If the gambling instinct of a nation were suppressed altogether, the nation would be the better for it. There are many types of human character the extinction of which would cause us as little regret as the extinction of the dodo. We don't want to see an everlasting series of generations of the brutes who stamp their wives to jelly, of the men whose highest ideal of happiness is beastly intoxication, or of those whose nearest approach to intellectual amusement is a careful calculation of the odds. If society were rendered more monotonous by the suppression of these types, the monotony would be an improvement. But we may further dispute whether it would become more monotonous. A vast amount of energy now runs to waste in producing a breed of horses and men distinguished by the possession of certain qualities. Cut off that particular channel for the display of energy, and the chances are that the energy would direct in itself into new channels. If a young man were forbidden to seek excitement from betting, it is conceivable that he might find a nobler mode of employing himself. Possibly, we do not say probably, he might take to political life; and might qualify himself for taking a worthy part in it, after the precedent of Lord George Bentinck, by studying political economy instead of the philosophy of training. Or he might take to an adventurous life, and voyages to the North Pole might become as popular as the attendance upon horse-races. He might extend our knowledge of natural history or of savage tribes. There are an infinite number of fields for the investment of human energy which are very partially worked, or not worked at all, for want of labour; and by stopping the leak through which so much good force escapes to no useful purpose, we might direct an equal amount of vigour elsewhere.

It is true that this argument may be applied differently; and indeed it supplies a sufficient ground for objecting to a measure which nobody advocates. The love of horse-racing is doubtless rather a symptom than a cause. Most of its devotees, we are quite ready to believe, are fit for nothing better. They are hopelessly frivolous, and incapable of better modes of amusing themselves; and therefore it is highly probable that they would find rather a worse than a better employment of their faculties. Gambling cannot be suppressed by these rough and ready methods. Suppress it on the Turf, and it will flourish the more vigorously on the Stock Exchange. A man who is at that stage of intellectual development at which tossing for halfpence in some more or less complex form appears to be a worthy mode of occupying a life, is not to be reformed by simply cutting off one of his means of amusement. Horse-racing has certain good points, it may be, and is therefore superior to other amusements for which that moderate excuse cannot be made. All that legislation can do in such matters is to exercise a moral pressure by attacking some of the grosser forms of a bad practice, when it has a strong weight of public opinion behind it. It is doomed to lag behind instead of preceding the conscience of the nation; for otherwise it would only change the form of the disease, or possibly drive it inwards. It is not for every complaint that we should use the lancet or the amputating knife. It is necessary to wait till the right moment is come, till the morbid growth is ready to drop off by itself, and a healthy curative process is certain to be set up in its place. And therefore we should fully admit that horse-racing must be left alone, perhaps for ever, but certainly till it has sunk through many depths as yet unreached, and is condemned by the moral sense of a much larger majority. Meanwhile moral remedies alone are available, and some sanguine people may hope that they will purify without suppressing the practice. Whether there is any ground for such anticipations we cannot at present inquire; but so long as they exist, they form an additional reason against any decisive surgery.

THE *DAILY TELEGRAPH'S* OLD SAVAGE.

THE conductors of the *Daily Telegraph* are probably disappointed at the apathy and indifference with which their sensational telegrams about the alleged fall of Khiva have been received by the public. They were printed in large type with portentous headings, and were supported by ingenious leading articles containing a great deal of curious speculation. It is idle to argue whether the telegrams were true or false. As a mere matter of probability the chances are that Khiva has fallen, and a prophet would have not risked much who took upon himself to predict that event at or about a given date, as soon as he knew that the expedition had started. After making every allowance for the difficulties of the country, the Khan is a pitiful foe for a great Power like Russia, and it may be assumed that the Russian Government is quite aware that it cannot afford to suffer even slight reverses in such a field. It may be taken for granted that, as far as human foresight goes, the Russians have used every precaution to ensure not only success, but instant and complete success, and it will be rather extraordinary if it should turn out that Khiva has, even by accident, been able to make head against the invaders. There is no difficulty in believing that Khiva may have fallen; but why anybody should be expected to believe it on the bare assertion of the *Telegraph*, without any confirmatory details, passes one's comprehension. The news was conveyed in a laconic message purporting to come by telegraph, and containing nothing more than a simple statement that Khiva had fallen. There was first a telegram without any date or address, and then a few days afterwards another, said to be by way of Tiflis. On the most favourable construction of these communications, all that could be said of them was that at the places from which they were supposed to have been despatched there was somebody who believed, whether on good or bad authority it was impossible to guess, that Khiva had fallen. That there were rumours to this effect at the places in question is not improbable, and it may also be assumed that the *Telegraph* published the communications in good faith, believing them to have been honestly sent to it. But all this does not touch the question why the public should be expected to attach the slightest importance to the mere assertion of an anonymous Correspondent who can give neither names, dates, latitude, nor longitude in support of his statement. Argument would be thrown away on such a mockery of news. There is no room for reasoning, for there is absolutely nothing to reason about. We will put out of question the possibility of the *Telegraph* knowingly hoaxing the public; but then the *Telegraph* may have been hoaxed itself, or the *Telegraph's* Correspondent may have been hoaxed. In any case, if what was transmitted was only a rumour, it would have been honest to say so. It may very likely turn out that at the time the telegrams were published Khiva had in point of fact surrendered to the Russians. But, on the other hand, there is nothing so deceptive as probabilities. Improbabilities are seldom invented, but probability is the fertile source of falsehood and conjecture. Whether this news turns out to be true or false is immaterial to our argument; in either case it is by itself unworthy of attention or belief, and we are glad to find that it has been so regarded. If the news is true, it is at least singular that the *Telegraph* should so long have had a monopoly of it, and that the Russian Government should either be ignorant of its own victory or in a conspiracy to conceal it.

In addition to its vague, mysterious, and unsupported telegrams, the *Telegraph* has also published for the enlightenment of the world some letters by a Special Correspondent entitled "Notes by the Way." At the outset it must strike any one that the value of these "Notes," regarded in any other light than as pure fiction, is somewhat impaired by the extreme anxiety of the writer to obliterate all traces of his footsteps, and to conceal whence he has come, where he is, and whither he is bound. A more appropriate title for this singular correspondence would be "Letters about Nothing from Nowhere in Particular." Attention has been directed to an odd literary coincidence in connexion with these letters. The Correspondent, dropping to earth for a moment in his mysterious flight to Khiva, meets somewhere on the "boundary line of the everlasting desert" an old man "whose features look doubly grim in their frame of snow-white hair." The old man replies courteously to his salutations, but "without losing for a moment the grand impassibility which is the birthright of all Oriental races." This suggests to the Correspondent that there is "a strange weird contrast" between the railways and telegraphs of the nineteenth century and "the tameless guerilla of the Eastern deserts, the same in every feature as when his forefathers swept Russia as with a whirlwind six hundred years ago." And so he leaves the "grand, lonely, irreclaimable old savage lingering in the midst of a world which has forgotten him." This description of the old savage was published in the *Telegraph* of the 30th April, but it happens that a fortnight before *All the Year Round* published a description of this identical savage, "grand, lonely, irreclaimable," "doubly grim," and all the rest of it, as having been met with in the neighbourhood of Balaklava, where his appearance suggested to the writer precisely the same reflections, in almost literally the same words as those used by the *Telegraph's* Correspondent. Borrowing the language of the latter, we should be disposed to say that it is impossible to conceive "a stranger or more touching spectacle" than the meeting of two Correspondents with the same "doubly grim" old savage in two

different parts of the world; but the *Telegraph* offers a very simple explanation of the mystery. It is "not surprising," we are told, that the old savage should turn up in both the articles, because they were written by the same person. This Correspondent, we are assured, is a "man of character," but unfortunately his "strong mental impressions" were a little too much for him, and so he saw—or at least wrote—double. It may be all very well for the *Telegraph*, knowing the writer, not to be surprised at his coming across the same old savage wherever he goes, or pretends to go; but it is only natural that innocent readers should be rather perplexed by such an odd repetition of identical incidents in different parts of the world. It is perhaps even more wonderful that the same Correspondent should meet the old savage twice in this way than that two Correspondents should each meet him once. The *Telegraph* seems to think that when it has explained that it has secured for the future a monopoly of this gentleman's savages, and that the only real genuine old savage is henceforth to be found in its own columns, there is an end of the matter. The candour of the *Telegraph* is a curious example of simplicity or effrontery. Its admission that it sees nothing "surprising" in the conduct of its Correspondent enables us to gauge the degree of literary honesty with which it is satisfied on the part of its staff. The *Telegraph* says it stands on its reputation, and complains that its contemporaries refuse to acknowledge its enterprise. Its enterprising character is certainly not unknown. The astronomical feats of its Paris Correspondents have certainly not been forgotten. It would appear that these gentlemen have *carte blanche* for turning on a moon whenever they want one, and twice within a short period they have produced the luminary, regardless of expense and almanacks, in order to enliven their graphic sketches. The *Telegraph* must not be surprised if its "old savage" is put in the same category as its handy moons.

We do not know how many of this wonderful Correspondent's letters have been published, but we have read a couple of them, and we must say that, apart altogether from the incident of the old savage, the letters are on the face of them about as absolutely worthless as anything of the kind could be. It does not in the least matter where the letters were written or posted, or whether the Correspondent ever saw the things he describes. It is enough to say that they contain nothing which could not have been written just as well in London. The writer explains that, as the Russians have refused to permit any Correspondents to accompany the expedition, he is obliged to keep his movements secret, and he pleads that he must not be "accused of want of clearness or candour" if he is "for the present sometimes vague as to the exact dates" of his letters or the places whence they are forwarded. The first letter contains neither date nor address. The addresses in the other letter, "On the Hills," "On the Road," are, we should imagine, well calculated to baffle the curiosity of the Russian generals. This necessity for secrecy on the part of the Correspondent is certainly a very good reason why he should be as vague and indefinite as possible, but it affords a still stronger and more obvious reason for not writing any letters at all. It is hardly worth while to print four or five columns of correspondence by a writer whose great object is to conceal as effectually as he can where he has been. We are told that "the shadow of doom is deepening over Khiva," and that the writer has been at Jericho, and was once in a Russian theatre in company with a Russian general. Then we have half-a-dozen lines of vague gossip from Moscow, some loose details about Khiva taken from well-known travellers, and a long description of a Russian eating-house, where, it seems, the guests drink tea, smoke, and eat cabbage-soup. But all this is not exactly news about Khiva. Our expectations are raised when the Correspondent meets "a traveller who is said to have passed through the Khivan territory from point to point," and again, when he and a Russian officer, in some other nameless region, "plunge into a discussion upon Central Asia, a subject in which he (the officer) is completely at home." But, unfortunately, nothing comes of it. You see, if the poor fellow were for a moment to divulge anything in the shape of information, the Russian generals—who are of course kept well supplied with files of the *Daily Telegraph*—would at once be down on him. He is obliged to confine himself to fine writing about "the insignificant States which form the milestones of history," "the little Syrian town" which had "the power to precipitate Europe upon Asia in an avalanche of ruin," about Russian tea-shops and villages, and a street fight, and "the sudden bursting of a mountain storm," and "a brave old song" he "learned years ago in one of the little log-built hamlets that dot the endless level of central Russia from a handful of Crimean veterans," in order that the Russian generals may be thrown off the scent, and led to fancy that he is still in Fleet Street. There is a story of a French married lady who desired to have a portrait of her lover, but directed the painter to make it as unlike him as possible, so that her husband might not recognize the features. The Correspondent of the *Telegraph*, in his terror of Russian generals, appears to have set himself a somewhat similar task, and to be executing it with considerable success. Only, if the Russians do not know what to make of him, neither does the British public. It would surely have been simpler not to write any letters at all.

It may be admitted that the impudent emptiness of this correspondence, and the equally impudent pretentiousness with which it has been put forth, are a novelty in English journalism. It is absurd to call stuff of this kind news. We say nothing of the authenticity of the letters or the character of the writer, but anybody who reads them can see that they are a mere flux of fine writing, and that they do not throw the slightest light upon the Khivan expedition, or anything connected with it. They are simply flimsy sketches of familiar objects of Russian life, to which an attempt has been made to attach a factitious interest by heading them "Khiva Expedition." As for the telegrams about the fate of Khiva, they would no doubt be important if they were true; but there is no means of knowing whether they are true or not, and nobody in his senses would believe a naked assertion of this kind without anything to confirm it, or to supply a means of testing it. Mr. Gladstone observed at the Literary Fund Dinner that the press tends at the present day rather to rapidity than solidity, and that it is too fond of excitement; and the observation is undoubtedly true. Rapidity and freshness are of course important in news, but after all freshness is not everything, and it is better to wait a day or two, or even a week or two, for safe, trustworthy intelligence than to be served with wild sensational telegrams and letters which are really not news at all. The first essential of news is that it shall be worthy to be believed, and for our own part we prefer the old-fashioned prosaic paragraphs to the flashy, frothy rhetoric and "strong mental impressions" of Special Correspondents. It is impossible not to observe in certain journals a dangerous confusion between romance and facts. It seems to be thought necessary to present facts as much as possible in a romantic form, so as to read like a chapter in a novel; but in the nature of things facts cannot be treated in this style without a good deal of trimming and adulteration, and there is a suspiciously easy step between dressing up facts like fiction and passing off fiction for fact. The newspapers may depend upon it that they cannot do better than stick to hard, solid facts, and keep as far as possible from the dangerous borderland between the novel and the news-letter.

PAPAL ELECTIONS.

MANY of our contemporaries, both English and foreign, were very busy of late with conjectures about the probable successor of Pius IX., whose health, if we may trust the *Lancet*, is in a sufficiently alarming state. One Florentine newspaper some weeks ago actually devoted an elaborate article to demonstrating, to its own entire satisfaction, that a particular Cardinal, whom it named, must and certainly would be the next Pope. If we felt disposed, as we do not, to hazard any conjecture on the subject, it would be that the alleged favourite would certainly not be elected. We have a profound distrust, abundantly justified by the regulations and the history of Papal Conclaves, of the value of any predictions on the subject. That the unbroken tradition of three centuries and a half, of always electing an Italian Cardinal to the supreme pontificate, will not be violated on the first occasion when its violation would be interpreted as a virtual surrender of the claim to temporal sovereignty, might be safely assumed even without the assurances of the *Voce della Verità*; and it is the only assumption which has any adequate basis. But while we disclaim all intention of adding one more to the various arbitrary guesses that have been put forward, our readers may like to have some more accurate information than is generally possessed of the existing conditions of the problem. What are the rules for conducting Papal elections; how they have practically worked; and how far they are subject to modification—are matters, not of opinion, but of fact. But they are facts with which the general public is very imperfectly acquainted. We have on former occasions traced in some detail the growth of legislation on this subject since the election was first confined by a Bull of Nicholas II. in 1059 to the College of Cardinals, and we cannot attempt to go over all the ground again here.* But we may briefly point out what is of special interest at this moment—the course of proceedings usually followed on the death of a Pope—and examine how far, if at all, it is liable to variation in special emergencies. With the civil incidents of an interregnum, such as the suspension of all judicial business and the liberation of prisoners, we need not now concern ourselves, as Rome is no longer under Papal government.

On the decease of the Pope the Cardinal Camerlingo at once becomes the principal personage, and it was formerly one of his first duties to direct the Senators of Rome to toll the great bell on the capitol, only rung on this occasion and at the opening of the Carnival. He receives and breaks "the ring of the fisherman," consigns the Pope's body to the penitentiaries of the Vatican Basilica, and takes an inventory of the contents of the Apostolical Palace. For each of the nine days intervening between the death of the Pope and the beginning of the Conclave, a meeting of Cardinals with special ceremonies is prescribed, the first three days being mainly occupied with the obsequies of the deceased Pontiff. On the tenth day the Cardinals are solemnly immured, according to the letter of the law, in the palace where the Pope dies; but from 1455 to 1823 every Conclave was held in the Vatican, and since the death of Pius VII., in the Quirinal in 1823, it has always met there. The next Conclave, it may be presumed, will revert to the earlier practice. Here, then, on the evening of the tenth day the Cardinals are immured in their "cells," and in theory cut off from all intercourse with the outer world; though in fact, as Father Theiner admits, the rule has never been strictly maintained, and in our own day Conclaves

* See *Saturday Review*, February 22, 1868, "Papal Conclaves"; June 22, 1872, "Right of Veto in Conclave."

have no pretensions to greater secrecy than generally pervades Cabinets, except that the prescribed arrangements afford peculiar facilities for secrecy when it is desired to observe it. After proving their right to the suffrage—and no Cardinal below the rank of a sub-deacon can vote without special license from the late Pope—they proceed to the election, which is conducted in a manner so elaborate as almost inevitably to defy all previous calculations. Of the three recognized modes of election, that by "inspiration" may be at once set aside as a mere abstract theory, though several instances have occurred of preconcerted acclamation, which is easily confounded with it. The election by compromise, where a disunited body of Cardinals agrees to delegate its powers to a small Committee, was last adopted in 1304, in the case of Clement V., but it is said to have been proposed in the third month of the long Conclave held at Venice which terminated in the election of Pius VII. The ordinary method is by ballot, consisting first of a simple ballot, and then, unless some one candidate has obtained a majority of two-thirds, exclusive of his own vote, follows what is called *accessus*, whereby each elector either repeats his former vote or transfers it—*i.e.* "accedes"—to some candidate whose name has already come out of the ballot-box. This double process may be repeated on the same day. It of course gives scope for all kinds of manœuvres, and a very common one is to put forward sham candidates, generally with the object of eliciting, and thus getting rid of, the veto hitherto exercised by the three Catholic Powers (Austria, France, and Spain) which can only be exercised once. It is most probable that in the next election the right of veto, which never had any statutable foundation, and is only between two and three centuries old, will be disputed, just as the right of the Catholic Governments to send ambassadors to the Vatican Council was disallowed, on the ground that they no longer support the exclusive claims of the Church. Any claim urged on behalf of Protestant Governments, such as Prussia, would certainly be rejected. Of the ceremonies that follow election we need not here speak, but on the actual working of the system a word shall be said presently. Meanwhile it is important to inquire, in reference to the future, whether the existing regulations are under all circumstances held to be absolutely binding, the more so as vague rumours are current of Pius IX.'s having provided for their suspension, if found advisable, in the election of his successor.

The decrees on which the composition and action of the Conclave chiefly rest are mainly three; the first, of Nicholas II. in 1059, restricting the franchise to the College of Cardinals; the second, of Alexander III. in 1179, requiring a majority of at least two-thirds of the votes for a valid election; and the last, of Gregory X. in 1274, prescribing the interval of nine days, the immuring of the Cardinals, and the method of procedure. Except in the abnormal instance of the election of Martin V. by the Council of Constance, after his predecessor had been deposed, and partially in one or two other cases, these regulations have always in fact been observed. But it is not the less certain that in theory they are liable to very considerable modification. Adrian VI. actually abrogated the famous Bull of his predecessor, Gregory X., which remained in abeyance through six pontificates. A more important case is that of Gregory XI., who had brought back the Holy See from Avignon, and, in order to secure its permanent re-establishment at Rome, which was endangered by the predominant French influence among the Cardinals, suspended by a Bull in 1378 all existing regulations about the Conclave, even empowering it to elect by a simple majority of votes; and this *coup d'état*, as it has been called, was held by ecclesiastical public opinion to be certainly justified under the critical circumstances of the time. But the most memorable precedent, both as coming much nearer our own day and because the Bull is, we believe, still in force, occurred in the reign of Pius VI., who was really suffering at the hands of Napoleon the persecution of which Pius IX. so loudly complains. In February 1797, when strong pressure was being put upon him to revoke his condemnation of the civil constitution of the French clergy—a proposal which the Cardinals urged him to resist at all costs—the draft of a Brief was proposed, suspending, *for the occasion of the next election only*, the prescribed interval of nine days before holding a Conclave, but it was never even transcribed. On the 30th December following, however, a Bull, *Christi Ecclesiæ regendæ*, was really promulgated, giving a similar dispensation, which was to hold good for any grave emergency threatening the free action of the electoral body. And even this appeared next year inadequate to the gravity of the crisis. One of the leading Cardinals, Antonelli (no relative of his present namesake in the Sacred College), pressed, and had almost induced, Pius VI. to sign a Bull superseding all the enjoined rites and conditions of Papal elections, except the requirement of a majority of two-thirds, and allowing votes to be given by proxy; but the Cardinals took alarm at so extensive an innovation, and the scheme was suffered to drop. Yet some months later (Nov. 13, 1798) another Bull was actually issued with the assent of the Cardinals, *Quum non superiori anno*, which is even more comprehensive in its dispensing clauses than Antonelli's rejected draft, except that it omits the permission for proxies. It was to apply to the Conclave immediately following, and to all others occurring under equally adverse circumstances; and it is, we presume, still in force. The Cardinals are left perfectly free to confer among themselves, on the Pope's death, as to the time and mode of election, even the practice of immuring the Conclave being left optional; the only restrictions retained being the prohibition of canvassing for any specific candidate during the Pope's lifetime, and the requirement of a majority of two-thirds, which Gregory XI. had, it will be remembered, in one particular case dispensed with. Still more recently Gregory XVII., during the troubles in the earlier part of his reign, drew up a document with his own hand, empowering the Cardinals to proceed to an election, if necessary, immediately on his death. It was, however, never published; and was found in the drawer of his writing-table after his death. What provision of a similar kind Pius IX. may have made we cannot say, but he is sure to have had these precedents before his mind. At the same time it is obvious that no active interference with the liberty of election is at all likely to be attempted on his decease, while on the other hand a much shorter interval than that prescribed will in these days of telegraphs and railroads enable the most distant Cardinals to reach Rome. It may therefore be anticipated that the proceedings will, in the main at least, be conducted according to established precedents, and hence it is worth while to inquire, in conclusion, how the existing system is found to work.

Those who wish to study the process of election in detail, in a case where a second Englishman narrowly missed the tiara, may read a pretty full account of the Conclave of 1550 in Dean Hook's Life of Cardinal Pole. Pole himself, although the chosen candidate of one of the two parties among the Cardinals, quietly occupied his leisure hours during the period of "immurement" in composing a treatise on the Duties of the Papal Office. The Conclave, however, actually terminated, after an abundance of plotting and counterplotting, as so often happens, in the election of one of the unlikeliest members of the Sacred College, who took the name of Julius III. He was chosen by acclamation, arranged beforehand, after all the favourites had for various reasons failed. But it will be more immediately to the purpose to refer to the last Conclave in 1846. Then, as now, the Sacred College had been carefully filled with strong Conservatives, nearly all of whom were nominees of the late Pope, and Gregory XVI., who had attained the age of eighty, died suddenly at the last, as may not improbably be the case with his still more venerable successor. There were two parties in the Conclave, the strongest headed by Lambruschini, the late Secretary of State; the other by Bernetti, who had held the same office under previous Popes. Of the possible candidate of the latter, or Roman party, as it was termed, from its leading members happening to be Romans, Mastai Ferretti was the least known or spoken of. Yet a series of accidents, originating in the folly of Lambruschini—who, in defiance of the accepted usage of the last two centuries, never to elect a former Secretary of State, endeavoured to secure the triple crown for himself—resulted on the second day in the election of Mastai Ferretti, a reputed Liberal, by a strictly reactionary Conclave. On the first morning, June 15, Lambruschini had fifteen votes and Mastai twelve, twenty-three more being distributed among other candidates. A second balloting and *accessus* the same afternoon had reduced Lambruschini's votes to thirteen, while Mastai now had seventeen. Only fifty Cardinals were present out of sixty-two, then the full number living, and they were anxious to get the matter settled before the arrival of their remaining colleagues; and as Lambruschini was now discovered to have no chance, his numbers on the morning of the sixteenth sank to eleven, while Mastai had twenty-six votes. The Opposition, or Roman party, were now resolved to make a push to carry their man, and that same afternoon the result of the *accessus* gave Mastai thirty-six votes, above two-thirds of the fifty electors present, while Lambruschini had only eight. Cardinal Acton's influence was believed to have turned the scale. Next morning arrived Cardinal Gaysruck armed with the Austrian veto, which would have arrested the election of Pio Nono if it had come twelve hours sooner. Cardinal Gizzi had been the general favourite, and the surprise in Rome at the result of the Conclave was universal. The name of the new Pontiff was almost unknown, and had never come into the betting. We must apologize for so profane an allusion in so sacred a connexion, but in fact the princes of the Church themselves, as well as the outside public, are wont to indulge the Roman passion for gambling during Conclave time. In a very graphic description of the Conclave of 1829 Stendhal tells us that he witnessed a Cardinal playing in the lottery through the wheel which served for the conveyance of meals to the immured denizens of the Quirinal. Whether this incident will be repeated in the next election we do not presume to surmise, but nobody ought to be surprised if the name of the successful candidate should turn out to be as little known or anticipated as was the name of Mastai Ferretti in 1846; less known it hardly can be. The most philosophical frame of mind in view of a Papal election is, *credo quia improbabile*.

MR. AYRTON AND THE LAW COURTS.

IT must be sorrowfully confessed that even Mr. Ayrton has at last become somewhat monotonous. His merit in his own particular line of performance is, we gladly acknowledge, undiminished, for talents such as his are do not depend upon the fashions of the passing hour. The falling off is in his audiences and in the managers with whom he has contracted an engagement which both sides are now discovering to have been somewhat lengthy. Even Aristides found to his cost that Athens could be bored by his extreme consistency, while we believe that

after a few more seasons the musical world would have devoutly prayed that Paganini might have been induced to procure a second fiddle-string. So the famous character of Bluff, the honest Minister, which seemed likely some two seasons since to make the fortune of the representative of that distinguished borough which once reckoned the Orton family among its constituents, has actually become a drug upon the repertory because nobody will be found to give a bespeak. One after another, those patrons of high dramatic art who used to come to the fore and call for the favourite have had to abstain from inviting a performance in which the staleness of the matter was so little compensated for by the finish of the comedian's manner. Perhaps the managers also, as we have hinted, were in fault for fighting shy of their old friend under the consciousness that the day could not be far distant when the appeal would have to be made to the general public for renewed support. They may have become a little nervous in putting forward a performer who was at each successive appearance as likely to provoke the resentment of the audience by his arrogance as to entertain them by the finished audacity of his personification. Mr. Gregory accordingly deserves much credit for having dared, at a moment of the Session when the House of Commons was settling down into calm stupidity—when Dublin University had passed into the limbo of settled questions, while Father O'Keeffe was for the moment a tabooed Parliamentary name, when Mr. Miall had been snuffed out, and Mr. Whalley had forgotten to sing, and even Mr. Delahunty was cherishing a brooding silence—to get up in his place and call upon the shrinking veteran to repeat one of those performances which used to bring down the House in days when a general election, even with the old dread of the hustings superadded, was no more than the muffled rumour of some far-off calamity.

Mr. Gregory, who possessed the advantage of speaking from a practical experience of our judicial system, and who could himself, as a former President of the Incorporated Law Society, claim no small share in maturing the scheme of a concentrated Palace of Justice, placed the necessity of proceeding with the building of the new Law Courts on a business-like basis. Money that had been voted in 1865 and 1867 for the work had for five years remained unproductive, and, reckoning the lost interest at 30,000*l.*, this would represent 150,000*l.* "But that was not all. By the provisions of the Act of 1865, the Government were bound to pay all the rates and taxes to which the houses which had been removed from the site were subject; and as those rates and taxes amounted to 9,000*l.* a year or more, making for the five years 45,000*l.*, a sum of about 200,000*l.* had been substantially wasted." This loss Mr. Osborn Morgan, who followed, placed at the still higher figure of 250,000*l.*, while both he and Mr. Gregory treated the concentration of the Law Courts as a necessary element in the fusion of jurisdiction. Mr. Ayrton's reply was a masterly mosaic of irrelevant issues and of evasions of the substantial question. The "public and the administrators of justice" had been, he asserted, "subject for centuries" to the dispersion of the Courts. No doubt; but the statement is a truism, unless it were intended to lead to the inference that so long as Ayrton reigned in Whitehall Place fresh years should be added to the already elapsed centuries. But then it "appeared that the legal profession had been going on for several centuries with a system of jurisprudence that was now announced to be erroneous"; a statement which, if it means anything, embodies the wonderful assertion that the constitution of the courts which administer the jurisprudence, and the quality of the jurisprudence which is administered in those courts, are one and the same thing. But then, after a scheme, which at the prices of five years since would have represented an outlay of 1,500,000*l.* for site and buildings, had been officially ratified, a larger plan to house more courts and offices on a wider area was formulated and subsequently laid aside, and the undertaking was further delayed by the proposed transference of the building to the Thames Embankment. All this was interesting ancient history, but it carried with it no answer to Mr. Gregory's plain question. The recapitulation of the incidents which intervened to delay the preparation of Mr. Street's plan for a building on the Carey Street site, upon the reduced scale to which the Government ultimately consented, would, if it had been fairly told, have been more to the point. Very good care was, however, taken that the whole case should not be presented, although the one certain fact which came out through the First Commissioner's haze of words, was that the architect at all events was not to blame; and so Mr. Ayrton went off into a handsome eulogy of himself for having materially cut down Sir Gilbert Scott's Home and Colonial Offices, and of Mr. Cardwell for having cost the country 5,000*l.* in changing the style of the London University.

The upshot of all this dissonant array of unconnected facts was that Parliament was whipped and sent to bed with the severe grandmotherly snub that "the House could not take a more unwise step than to cut into the middle of the negotiations which were now going on." The one thing which Mr. Ayrton took care not to say, but which the House naturally inferred from his silence, was that there was something in the rumour which asserted that, after the smallest and plainest building suitable for the complex purposes of our Law Courts, without being in discord with the national dignity, had been arranged between the Government and the architect, that building, on the opening of the tenders, was to be discarded, simply because by the recent rise of prices the precise sum which would two years ago have symbolised that structure could no longer carry it through. Mr. Street had on trial shown himself both scrupulous and successful in keeping with inexorable frugality within the 750,000*l.* of 1871, and he was therefore to be punished by being ordered to mutilate his structure, to the detriment of justice and the inconvenience of suitors, no less than to the damage of art. It was in particular felt that the one conspicuously noble feature of the design—a feature which above all the others had been in the first instance dictated to him by the Commission—the Central Hall, was in jeopardy. It was not therefore wonderful that member after member rose on each side of the House to "know the reason why," and that, with the slight exception of Mr. Eustace Smith's feeble support, the First Commissioner was left absolutely friendless. In the meanwhile Mr. Lowe was absent, and Mr. Gladstone sat on in unexcited silence. We are accordingly not without hope that in this case the growl of the First Commissioner may after all not prove to be the voice of the British Government. Whatever the Ministry may have said or done, or whatever may be in store for it to say or do, to the mortification of its supporters and the exultation of a buoyant Opposition, it will, we hope, at least spare itself the disgrace of having consented to disfigure the Palace of Justice in order to gratify the petulant humour of the senior member for the Tower Hamlets.

PARLIAMENTARY ELECTION PETITIONS AND CORRUPT PRACTICES.

IT may be well to remind Her Majesty's Government, and especially the law officers, that the Parliamentary Elections Act which created the present plan of trying Parliamentary election petitions expires at the end of this Session. It was originally provided that it should expire at the end of last Session; but the Attorney and Solicitor General, who introduced last year a Bill of renewal with some few additions (Corrupt Practices Bill), did not proceed with it, and at the end of the Session there was nothing to be done but simply to renew the existing Act for a twelvemonth.

We are now in the fifth year of trials of election petitions by Judges of the Superior Courts proceeding to the places of origin to try them. One result of this system is to give three Judges a year of rest and idleness in every year save the one immediately following a general election; but it might perhaps be possible to secure their services on more economical terms. It would be well also if we could hope from the Government a careful consideration of the policy of the present system of election trials, with regard to trusting for any and all inquiry to the willingness of petitioners to bear the burden of a costly and uncertain suit; and also with regard to the assimilation, under the operation of the Act, of election petition inquiries to trials at Nisi Prius as to costs, requirement of particulars before trials, &c.

The Act of 1868 was immediately followed by a general election, and the numerous election petitions of 1869 were, in England, tried by three Judges of high calibre, whose eminent fitness to make the best of the Act no one would dispute. The great acumen of Mr. Justice Willes, unhappily lost to us, and of Mr. Justice Blackburn, and the sturdy sense and sound feeling of Baron Martin, were employed in England on the many petitions arising out of the general election of 1868. It so happened that in 1869 a Committee of the House of Commons was sitting on Parliamentary and Municipal Elections—that Committee out of which the Ballot has sprung—and the Committee, before terminating its labours, naturally sought to obtain the advice of the three very distinguished Judges whom we have named as to the operation and efficiency of the new Parliamentary Elections Act, founded on their observations and reflections in their election trial circuits. It might be supposed that it would naturally have been the desire of the Government, in framing their Bill of last year "To Amend the Corrupt Practices Prevention Act and the Parliamentary Elections Act, 1868," to show careful deference to the suggestions of Justices Willes and Blackburn and Baron Martin. The Bill was probably concocted in a hurry, and it will be an advantage of delay that more attention can now be given to those suggestions. It would indeed be strange if the Government, in framing a measure of amendment, neglected to seek the assistance of the Judges who administered the Act, and found many blots and shortcomings in it. The Bill of last year was to be called the "Corrupt Practices Act, 1872," and it contained a provision for prohibiting the use of rooms in public-houses, which had been recommended by the Committee of 1869. The Government might perhaps go further and close public-houses on the day of election. Baron Martin recommended this in the most emphatic terms. "I have," he said, "a very strong opinion indeed, that the public-houses ought to be closed on the day of polling. I think the quantity of drink on the day of polling, and the state in which many voters were alleged to have come up to vote, were perfectly scandalous; they were so drunk in two or three cases that they did not know who they came to vote for. In one case, at Norwich, the voter would insist on voting for Patterson and Steward, the brewers there." Much evidence was given before the Committee of 1869 to the same effect as Baron Martin's strong opinion. But the Committee, while declaring their opinion that the closing of public-houses "would tend to the tranquillity and purity of elections," abstained from recommending it, because "we fear that the inconvenience to the public generally of such a measure would be so great as to out-

weigh its advantages." When the Committee reported, there were two days to be thought of, the nomination day and the day of polling. But the Ballot measure of last year has done away with public nominations, and all the turmoil and excitement connected with them. It might perhaps be possible to make provision for exceptional cases of real inconvenience or hardship in legislating for the general closing of public-houses for one day, the day of polling. Three members of the Committee, Mr. C. Villiers, Mr. Leatham, and Mr. Fawcett, opposed the passage in the Committee's Report expressing a fear as to public inconvenience.

The Judges experienced great difficulty in certain cases of exceptionally large expenditure, in obtaining absolute proof of any case of infraction of law voiding a seat under the statute. All the three Judges strongly recommended an enactment that extravagant or unreasonable expenditure should vacate a seat. Mr. Justice Blackburn suggested that any expenditure exceeding 5*s.* a head should for this purpose be declared unreasonable. "I think it well worthy of consideration," said Baron Martin, "whether there should not be an enactment that extravagant general expenditure, and I will limit it to that, should void the seat; whether 7,000*l.* at Bradford, or 9,000*l.* at Westminster, should not of itself void the seat." Another suggestion was very forcibly put by the Judges, that they should be enabled to unseat for an extensive practice of illegalities visitable under the statute only by penalties, such as conveyance of voters, voting of persons paid for employment in the election, &c., showing by extensive adoption a deliberate design to violate the law, and constructively proving systematic corruption. In the dropped Bill of last year the hiring of rooms in public-houses was made an offence punishable with a fine not exceeding 20*l.* This might do for one case, or two, though there would hardly exist a sufficient motive for prosecution; but if it came to the hiring of a large number—of 158, as was done for Mr. Ripley at the last general election at Bradford—is there not reason in the suggestion of the Judge that such wholesale illegality should itself void a seat?

Mr. Justice Willes strongly remonstrated against the insufficiency of the present provision in the Corrupt Practices Act against the giving of refreshments to voters on the days of nomination and polling, and advised that any giving of refreshments or treating within a week before the election by a candidate or his agent should void a seat. The 4th section of the Corrupt Practices Act of 1854 defines "treating" which voids an election as an act done "corruptly" or "for the purpose of corruptly influencing." The 23rd section of the same Act makes "the giving or causing to be given to any voter, on the day of nomination or day of polling, on account of such voter having polled or being about to poll, any meat, drink, or entertainment by way of refreshment" an illegal act, punishable by a fine of forty shillings for each offence. Mr. Justice Willes's opinion on this state of the law is eminently worthy of attention:—

> I do not believe in the effect of treating people a long time before the election; but with respect to numbers of those who have been put on the register under the Act of 1867, to speak plainly, I do believe in the effect of treating upon them while the simmer is on; and I should say, with respect to that 4th section, that it seems to me to be too strait laced by reason of making corrupt intention essential; and, with respect to the 23rd section, it has two defects; first of all, it is limited to the day of the nomination and the day of the poll. I think that is too short; I think a week at least might be allowed for the effect of the treating; and I also think that the 36th section, which at present annuls an election on account of treating within the 4th section only, ought to be made to include the 23rd section, and that any person who gives voters drink within a short time before the election on account of their being voters, whether with a corrupt intention or not, ought to be held to do a thing which is so suspicious and so likely to lead to ill consequences that the election ought to be voided.

This was the deliberate opinion of a most acute, conscientious, and public-spirited Judge, and deserves the attention of the Government. There are many other valuable recommendations and suggestions in the evidence given by Mr. Justice Willes and by Mr. Justice Blackburn and Baron Martin in 1869. The Judges took a large and liberal view of legislation against corrupt practices. They objected to the extent to which the employment of paid canvassers was permitted, as a fruitful source not only of expense, but of chicanery and corruption. They pleaded for further representation of the public interest in election inquiries than their own powers under the Act permit. A public prosecutor, without which the public interest of purity of election is at the mercy of private caprice and convenience, was suggested for serious consideration. The reduction of expenditure, an obvious effect of which is to deter men of only moderate means from candidatures, was considered, as well as the prevention of actual corruption. "Ought you not," asked Mr. C. Villiers of Justice Willes, "to discourage as much as possible anything that is unnecessary in the way of expenditure?" "Undoubtedly," replied the Judge, "otherwise you give a rich dullard the advantage over a poor man of intellect." We shall be glad if, in view of a not distant general election, these remarks may serve to stimulate the Government to apply itself to a necessary duty. There is yet time to do something effectual before this Session expires. Let the law officers of the Crown cause to be prepared a *précis* of the evidence given in 1869 by Mr. Justice Willes, Mr. Justice Blackburn, and Baron Martin—let their leading recommendations be formulated—let the two survivors and other Judges who have since tried elections be consulted, and let the Government then give careful consideration to the deliberate recommendations of the Judges, and they may yet introduce before the end of the Session a substantial measure for continuing and improving the Parliamentary Elections Act of 1868. It is very desirable that a serious effort should be made to ensure a considerable diminution of corruption and expenditure before we are embarked in another general election.

GALLOWS LITERATURE.

THE old lady who liked to enjoy her murders ought certainly to have been a subscriber to the *New York Herald*. The readers of that famous journal have lately supped full of horrors. Hanging, we are told, is by no means "played out" in New York, and the faculty of writing about hanging was never developed to such perfection. We have before remarked the admirable manner in which the powers of imagination and observation are made to co-operate in producing the *Herald's* reports of interesting occurrences. The bewildered reader is tossed hither and thither on the flood of eloquence, and, like "the pale pilot" at the mouth of the Orinoco, he

> seeks in vain
> Where rolls the river, where the main;

or, in other words, he cannot separate fact from fiction in the exciting narrative. We have before us an article headed "Nixon's Nemesis," which begins by stating in plain prose that Michael Nixon died on the gallows at New York on the morning of the 16th May. He quarrelled about the right of the road with Charles H. Phyfer, pulled out a revolver and shot him through the head, so that he died within ten minutes. He was tried, found guilty, and sentenced to be hanged, and found, to his astonishment and dismay, that the sentence would be carried into effect. The respectable inhabitants of New York, who, according to the *Herald*, were lately inquiring "what they should do to be saved," have answered their own question by hanging a few of the atrocious ruffians by whom their city was infested. Nixon sank to abject terror when he lost hope. He held affecting interviews with his wife and children, and a reporter was present, or dreamed that he was present, with a note-book all the time. "The *Herald* of yesterday contained an account of his farewell to his children, of his affectionate parting from his wife. It was not his last." The market was propitious for a few more parting words. A positively last final interview was held. Speech was almost choked by emotion, and yet the reporter managed to catch every word. After parting from his wife Nixon returned sadly to his cell. He looked around. "All was so still and silent." He sat down and was evidently still thinking of his wife. "He murmured her name and spoke to her." He was recalled to himself by Father Duranquet, who began praying. Nixon prayed too. His eyes shone with a strange light. He sighed. "What a deep, deep sigh!"

We are quoting, with almost verbal accuracy, from what we should call, if we were speaking of an English newspaper, a report. There has been no change of type, except an occasional introduction of capitals, which is a common practice of the *Herald*, since the verdict and sentence in open Court, and now we find ourselves in the condemned cell. Was the reporter really peeping and listening through a chink or *tron*? If he was, we think that the respectable inhabitants of New York should once more bestir themselves for the credit of their city and put an end to an indecent practice. "No words could have expressed the anguish he (Nixon) must have felt." We are glad to find that the reporter had some little modesty, although he appears to have stripped himself of delicacy. Even he could not undertake to paint the scene between the murderer and the priest. After a few minutes Nixon listened to the reverend Father's words, and became calm. He was prevailed upon to go out into the corridor. He smoked for half an hour. "He seemed to enjoy it." Then he prayed again with the priest. At midnight he ate supper in the corridor. "He could not eat much—a piece of bread and coffee—that was all." He returned to the cell, lay down, and tried to sleep. The lamp threw a ghastly light upon the different objects in the cell. He shut his eyes, but a horrible sight rose up before him. There was blood upon the wall—a human form—deathly glassy eyes—blood—blood—everywhere blood. He started up with a shriek. All was quiet, all was dark. No blood, no terrible vision; but the kind Father spoke gentle words of love that sank into his soul. He lay down again, but could not sleep. He jumped up and clutched the iron bars. "Yes, he was a prisoner." Then he went to sleep, and dreamed that he was standing under the gallows and a reprieve was brought by his wife. He awoke, and presently went again to sleep, and dreamed that he witnessed his own hanging.

All this is written with considerable power, and it might furnish Mr. Irving, or any other actor in the homicidal line of business, with an effective recitation. But is it or is it not a newspaper report? There is nothing to prevent a continuation of the same narrative after Nixon was actually hanged. If a reporter can see and hear through stone walls and iron doors, perhaps he can look behind the veil of death. The eye which searches the Tombs at midnight ought to be capable of penetrating beyond the grave. We may suppose either that the reporter peeped and listened, or that he picked up a few hints from a warder and arranged and adorned them, or that he drew upon his imagination for the whole description. American readers do not perhaps care for these pedantries of detail. They like their daily reading to be hot, strong, and highly spiced, and they

care little to inquire into its origin and process of manufacture. But in England it has been hitherto the custom to expect that a Special Correspondent who described a battle should at any rate be somewhere near the baggage of one of the contending armies. No doubt battles are very much alike, and, to borrow Sir Robert Peel's translation of a Latin adage, one is a good deal safer in the Middle Temple, where also pens, ink, paper, and books of reference are more plentiful than they could be on a campaign. But still it has been usual to regard the Special Correspondent and the leader-writer as belonging to different departments of journalism. The gentlemen employed by the *New York Herald* appear, however, to be able to turn their hands to everything at the same time. The narrative proceeds from night to morning; the prisoner washes and dresses himself and goes to chapel; the sheriff, under-sheriff, and deputy-sheriffs arrive. "They were all dressed in black, wore high hats, and had a solemn air." The reporter has descended from omniscience to the exercise of ordinary human faculties. We even feel ourselves equal to observing and describing the sheriff's hat, and there have been English writers capable of observing and describing hangings. But this reporter cannot be content even with the last "dreadful struggle." He followed, or supposed himself to follow, the dead body to Mrs. Nixon's house, and he describes her reception of it.

Murderers can be hanged quite as effectually in Illinois or California as in New York, but they must not expect to have their last hours described with as much particularity and brilliancy as if they lay in prison at the Tombs. The reporters of the *Herald* at those distant places are fully equal to the occasion, although not so manifestly superior to it as are their more accomplished brethren at home. They can, however, make free use of capitals, and it is interesting to know that "a heartless, determined, cold-blooded murderer" named O'Neal was able to make "a hearty meal before dying." His breakfast consisted of beefsteak, fried eggs, coffee, bread, butter, and cherry sauce. He died an easy death, whereas Nixon underwent "horrible convulsions." If we could be sure that these convulsions were not invented by the reporter, we should incline to draw an inference that hanging, like sea-sickness, is borne better by those who feed generously. The reporter in Nixon's case does not say a word about breakfast, and we may surmise that he mentions everything that did happen, and perhaps something that did not. An Italian named Lusignani, who murdered his wife, was so fortunate as to receive the attentions of one of the most gifted reporters of the *Herald*; but this murder was committed in New Jersey, which is near New York, and besides, the victim was Lusignani's wife, "a splendid type of the peculiar style of beauty for which the peasant-women of Italy are so justly celebrated." The reporter may have seen Lusignani's wife either alive or dead, and he may not; but he has seen other Italian women, and this is one of the tip-top artists of the press, who is not to be fettered in his composition by any petty regard for fact. "She was of medium height, but her form was rounded to perfection, and her step was like that of a queen. She had glorious black hair, a set of pearly teeth, small hands and feet, and a broad intelligent forehead." This would read very well in a novel and look very well in a picture, and a report in the *New York Herald*, by a first-rate hand, combines the advantages of both. The story which follows of the wife's adultery and the husband's revenge is sufficiently commonplace. "The people of Morristown had become greatly attached to" Lusignani during his imprisonment and trial in their city, and delicacies of all kinds had been freely supplied to him since sentence was passed. Admitting that there were extenuating circumstances in this murder, we yet see nothing in the murderer to excite attachment, unless it were the deep rich voice in which he sang the patriotic songs of his country in prison so as to be heard by passers-by. The reporter, by the prisoner's invitation, passed the night before the execution in the condemned cell along with three priests, and he describes all that he saw and heard. In this case, therefore, there need have been no drawing upon imagination, and indeed the narrative of the last night has a matter of fact aspect which is, if possible, more disgusting than the poetic halo thrown around the last hours of Nixon. We are surprised, not that such things should be done by the *New York Herald*, but that they should be permitted by the authorities of a civilized and Christian city. The reporter quitted the cell at six o'clock and returned at seven. He was fortunately in time to see Lusignani take his breakfast, which consisted of beefsteak and toast. "He made a hearty meal, observing that it was the last he should ever eat." He also "gave utterance to many beautiful sentiments, some of which were very poetical." It was perhaps the prisoner's ability to do his poetry himself that induced this reporter to confine himself to prose.

The necessity had become manifest of hanging murderers in New York and elsewhere, and the accompanying evil of descriptions of hangings in newspapers must therefore be patiently endured. It may be instructive to abolitionists of capital punishment to observe the present reaction against their doctrine in America. In quiet orderly times and places they may gain a hearing, but when it comes to shooting or braining passengers in Broadway, respectable society instinctively agrees to hanging a few rowdies. The *Herald* knew quite well what it was about when it "put down its foot" that Foster, the carhook murderer, should be hanged. Foster was hanged accordingly, to the general satisfaction of mankind. But it is unsatisfactory to find that there cannot be public hanging without gallows literature, and if New York desires to preserve respectability, she must not only hang murderers, but endeavour to hang them decently.

THE ROYAL ACADEMY.

IV.

THE present Exhibition, like its immediate predecessors, proclaims that the vast majority of our English painters have pledged themselves to the prevailing school of naturalism. And yet it is but too evident that our artists are not agreed as to what nature really is. Thus Mr. Hodgson, A.R.A., Mr. Marks, A.R.A., Mr. Hook, R.A., Mr. Faed, R.A., and Mr. Eyre-Crowe, severally study nature as closely as they can, and yet the works they exhibit are as widely dissimilar as if they were guided by opposite principles. This divergence of styles is avowedly caused by the varied complexions of individual minds; not only do tastes differ, but eyes see diversely, and thus no picture can be what nature is, but only what nature seems. In short, all critics now receive as an axiom that every work of art is the union of outward nature with inward thought. It is also obvious that the varieties of tastes affect the choice as much as the treatment of a subject; thus, among the above-named artists, Mr. Hook chooses a fisher-boy, Mr. Faed a Highland lassie, Mr. Marks an ornithologist, Mr. Hodgson an Arab. And yet there is seldom a true work of a successful artist wherein the choice of the subject and the treatment are not one and indivisible; thus in the examples we shall hereafter quote, it will be found that the painter selects what he loves most and can paint best, that he takes from nature what is in nearest response to his own mental condition, that he leaves out what is foreign to his life and outside his sympathies. The law, indeed, is established, within the Academy as elsewhere, that what the artist looks at lovingly he will paint lovingly; there is found, in fact, in all true honest work a more or less perfect accord between the nature chosen, the mind choosing, and the hand executing. We think it a good sign of the times that, with some signal exceptions among certain Academicians and Associates who still persist in perpetuating obsolete styles, our leading artists approach nature with sincere convictions; they are naturalistic in the best sense of the term inasmuch as, while they prove true to outward nature, they are not unmindful of the promptings of that inward nature which in its highest manifestation is genius. In fine, the Academy, though it does not yet fulfil the exigent demands of scientific naturalists, is yet growing year by year more truly naturalistic.

"Jack-a-Shore" (329), by Mr. Hodgson, A.R.A., is a picture of unflinching naturalism; that it is without the smallest approach to the beautiful may be taken in proof of its absolute truth. "Jack," an English sailor, sprightly and ready for a spree, finds himself in the midst of a company of drowsy and dirty Arabs. The contrast is striking, yet scarcely agreeable; nevertheless the picture by its shrewd penetration into character justifies the election of Mr. Hodgson within the pale of the Academy. "A Birdseller in Tunis" (894), by the same painter, is also unpleasantly true; in short, these supremely clever transcripts from degraded types of humanity may be taken in refutation of the accepted dogma that the province of art is to please. The repellent grandeur of ugliness is a theme which still remains to be worked out, yet the appointed mission of genius would still appear to be to lead the mind towards beauty and noble forms of truth. Mr. Marks, A.R.A., is another painter who has deservedly won his way by keen insight into character; yet "The Ornithologist" (380) labours under the disadvantage of telling a twice-told tale; neither is there novelty of idea in "What is It?" (195). In a previous picture, "The King is Coming," we were permitted to see the faces of the spectators, but in the sequel now before us we are allowed to gaze merely on their backs. Really our artists must lead less intellectual lives than is usually imagined thus to be driven to expend invaluable hours on valueless thoughts. It might not be a bad plan for the Academy to keep a poet, after the manner of certain trading houses, whose duty it should be to supply the members with ideas. Possibly Mr. Yeames, A.R.A., in "the Path of Roses" (517), may suppose that he has struck out a new thought, yet we cannot congratulate him on having produced an artistic composition. A bridal party would bear a lighter and more sportive hand; we preferred Mr. Yeames when, in years past, he painted the toothache of Queen Elizabeth. The three painters above-mentioned—Messrs. Hodgson, Marks, and Yeames—belong to what is sometimes called the school of St. John's Wood; and the singular fact yet remains unexplained that that so-called school was brought into the world colour-blind, and it remains so constant to its negations and its discords that we can but suppose it has found, in its own eyes, a more excellent way than was known to the painters of Venice. It is a favourite theory among certain critics, especially in France, that art creations correspond to physical conditions. Possibly a French expert coming to London might be able to assign as a cause of the clayey colour of the St. John's Wood school the clayey stratum on which the artists live, while the superior colour of the Kensington school might be equally ascribed to the fine gravel subsoil which lies beneath West End studios. Such a conjecture would not seem an unfair parody on a certain class of art philosophers.

Mr. Pettie, A.R.A., and Mr. Orchardson, A.R.A., differ from the St. John's Wood school in being less pronounced in form and

more pleasing and sportive in colour; indeed the works of these two capricious Associates might appear to support the saying that in nature there exist no outlines. But they push the idea too far; their forms are blurred, their colours broken. Yet "The Flag of Truce" (401), by Mr. Pettie, which in conception comes as a sequel to "The Sortie," presents a fine arrangement of colours, passing from black to white, and from red to brown and yellow. The composition is well conceived; from out of a shadowy vault or gateway marches the Burgomaster, attended by two chief citizens. The heads are fine studies, not unworthy of the school of Rembrandt. A throng of starving clamorous women press forward, eager on any terms to secure food and freedom. The painter gains force in concentration. Mr. Orchardson, on the contrary, as his custom is, dissipates his effect by diffuseness. "The Protector" (194), and "Cinderella" (354), are scattered and scratchy, with empty spaces of "canvas to let." It is understood that an accident prevented the painter from contributing a work more commensurate with his known ability. Mr. Boughton, like Mr. Orchardson, has a clever way of making a figure assert its presence in wide space. The little "heir" to a large domain, accompanied by a dog and other care-takers, walks through his ancestral park; the year is far advanced, the leaves of autumn lie thick upon the ground, and grey November has taken possession of the sky. The tone is almost more foreign than English; the prevailing tertiary colours belong to a certain class of French painters, who see in nature placitude and repose. Indeed there has never before been a time when the Academy gave such favourable signs of foreign influence; on all sides we see that our painters have, to their advantage, studied in foreign schools; and thus our English art, which at one time boasted of being insular and isolated, is daily becoming more cosmopolitan.

Mr. H. Goodall, son of the Academician, is one of the many artists who have formed their styles in Capri. The manner that has grown up in this island, which for loveliness is not surpassed by any of the isles of Greece, is less English than French; indeed, in the composition now exhibited, "Capri Girls Winnowing" (372), we could almost fancy the presence of M. Hébert, whose well-known picture, long in the Luxembourg Gallery, of two peasant girls on the neighbouring coast of Amalfi, first struck the silvery keynote which was caught up by the late George Mason, and may yet, it is to be hoped, find many a responsive echo among artists of the rising generation. Mr. Goodall has focussed his highest light on a white sheet stretched to receive the winnowed wheat—a treatment specially characteristic of Mr. Mason, as might be seen in works recently collected at the Burlington Fine Arts Club. The French artist, M. Hamon, has often shown like delicious delicacy in transitions from creamy white to opalescent grey. In such arrangements of light and shade the difficulty is to keep the several colours in relative tone and place, a task which Mr. Goodall has in this well-considered work accomplished with comparative ease. "Capri Girls Winnowing"—the winnowing being of course not by machine, but by the wind—is an incident which naturally brings the figure into graceful lines; a white wall as a background, dappled with sunlight and shadow, is the usual expedient of the Capri school. The pictorial principles upon which Paris and Capri have come to agreement find further illustration within the Academy. We do not happen to know where either Mr. W. B. Morris or Mr. P. R. Morris may have studied, yet "Sirens" (675), by the former—the sirens being two girls on the shore, who beguile a fisherman in a boat—though more than sufficiently commonplace in subject, is supreme for that serenity of sunshine, passing from silver into gold, which in and about Capri is the pleasure of travellers and the perplexity of painters. We may add to the above a simple English scene, "Good-bye: God Bless You" (636), by Mr. P. R. Morris; here again we dwell in delight amid the play of subtle, slumbrous colour reflected from white surfaces; under the old routine these surfaces would have been white, and nothing more. The Venetians might have transmuted them into gold, and so would have overwhelmed hues more tender and evanescent than the rainbow. We search for a parallel to these rare effects not so much in old schools of painting as in the ancient fabric of Venetian glass. The opal glass, creamy and iridescent, throws off light and colour like to the shadowy and sunshiny surfaces in pictures of this new and anomalous school. The three works we have mentioned, though from outsiders, are all on the line—one proof among many that fair play is not altogether foreign to the policy of the Academy.

Nature receives within the Academy strange treatment; sometimes the approach made to her is, as we have seen, modest and diffident; but when such painters as Mr. Long, Mr. Burgess, Mr. Halswelle, and some others come into the field, nature herself retires. "Moorish Proselytes" (628), by Mr. Long, "The Rush for Water during the Ramadan, Morocco" (488), by Mr. Burgess, and "An Image Seller in Naples" (1085), by Mr. Halswelle prove the dire calamity which befalls an art taken at second or third hand. First came Murillo, second followed our Spanish Phillip, and now, so long as Providence may permit, survive Messrs. Long, Burgess, and Halswelle. What cannot but be felt is that these three painters—the foremost of their kind—have nothing to offer in the way of subject, sentiment, or colour, that is not either threadbare or factian. From what we know of Spain, of the coasts of Africa, and of Syria, we are led to hope that studies may yet be seen in the Academy which shall with simple fidelity, yet with poetic ardour, reflect pictorial effects which in no other regions are equalled or approached. French artists have much to teach our English painters as to Oriental modes of treatment. Yet it is to be feared that teaching, writing, and speaking go for little or nought, so long as the Academy allows itself to be ruled not so much by President or Council as by potent picture-dealers. Manchester makes the mart, and coarsest colours prove best in keeping with commercial calicoes.

We began with schools of nature called naturalistic, and therefore we cannot more fittingly close than with painters such as Mr. Faed, R.A., and Mr. Hook, R.A. Perhaps there is nothing that is very new to say of either of these artists, who, in fact, have for many years freely and fully unburdened themselves of whatever may have seriously laid hold on their affections. Yet Mr. Hook, in a scene from "The Shetlands" (254), wherein children on a rocky cliff overhanging the sea rob the nests of enraged birds hovering in the air above, tells us once more that art is endless and nature inexhaustible. It is no easy matter to combine into unison figures and birds on this scale with a landscape which in its outline and aerial perspective would remain perfect even were its living inhabitants taken away. In such a composition, as in others which we would gladly mention did space permit, the public may be taught to recognize the immutable relation between nature and art; the true painter knows how to subject nature to the conditions of art, a process which the so-called Pre-Raffaellites of the last decade ignored. We are glad to be able to add that the present Exhibition makes known the final extinction of that pretentious and mistaken school.

THE ALEXANDRA PALACE.

ONE cannot too much admire the spirit of enterprise which has completed and opened the Alexandra Palace, but it is difficult to understand why amusements properly belonging to the town should be transplanted into the country. There has grown up around the Crystal Palace a neighbourhood for which theatrical and operatic performances are conveniently provided by the managers of that establishment. Perhaps in course of time the Alexandra Palace will be similarly surrounded, and indeed we may conjecture that it has been founded with a view to increase the value for building purposes of adjacent land. But at present it seems almost an absurdity to invite several thousands of persons to the top of a hill six miles from Charing Cross to hear not very perfectly or conveniently an operatic concert. The programme of an opening day in May naturally comprises a flower show and a concert. The example of the Crystal Palace suggested this arrangement, and indeed there is little scope for originality in such matters. The *Alexandra Guide* contains a programme for the season which presents many familiar features. There are to be fruit and flower shows on an extensive scale, and as they will take place "from time to time," the author of the *Guide* cannot undertake to describe them in its pages.

> The Spanish fleet thou can'st not see, because
> It is not yet in sight;

and an exhibition of autumn fruits is invisible except to the imagination at a time when the fires of winter are hardly cold. There are to be horse, dog, cat, and poultry shows; and dramatic fêtes, and volunteer fêtes, and reviews are promised in the same paragraph as if partaking equally of the histrionic character. The concert of last Saturday was held in the centre of the building, but there is a special concert-room, and also a theatre with a stage said to be nearly as large as that of Drury Lane. We are reminded by this description of the king who was offered horses on condition that he could find riders. The Alexandra Palace has its theatre, and now what is to be done with it? If Mr. Tom Taylor should desire to continue his experiment of performing Shakspeare, an opportunity seems to be here afforded to him. "The working parts of the stage are all on the most ample scale and approved principle." In fact, nothing appears to be wanting except plays and actors, and perhaps an audience. The Palace is reasonably accessible. It may be reached by rail in an hour from Victoria Station, and when once you are in the train you may get back in the same time. But if there should be a large assembly, the competition for early places in the return trains is likely to be severe. The drive of six miles from Charing Cross is pleasant, and those who go in carriages can choose their own time of return. But whether it is worth while to go so far except on some special occasion like the opening may be doubtful. It surely cannot be worth while to drive six miles, finishing up a severe hill, for the sake of hearing a concert or seeing a theatrical performance. There is the Albert Hall available for concerts, and whatever other causes may exist for the decline of dramatic talent in London, it certainly cannot be alleged that actors labour under a difficulty of finding theatres to play in. However, you can reach the Alexandra Palace by rail from almost any part of London if you wish to go there. Special trains ran on Saturday from Moorgate Street to King's Cross, and thence to the Alexandra Palace. It may deserve notice that, if you take the train at Farringdon Street, you are on the left or near side of the Metropolitan Railway, and when you arrive at King's Cross you are on the right side. You must therefore have crossed the line, and in fact you do so close to the King's Cross Station. The regular traffic of the Metropolitan Railway and the special traffic for Alexandra Palace were conducted, so far as we know, without accident on Saturday, and this result is due to the perfect manner in which the system of signalling is now managed upon the Metropolitan lines. Indeed any failure from perfection would be destruction. But these

things should not be thought of in these ways. It is a pity that some of the carriages used in the special trains on Saturday are so built as to leave a gap between the carriage and the platform. In a hurry or in an imperfect light it would be easy to put the foot into this gap, although more easy not to do so, and a fall consequent on a false step might cause severe injury. Luckily the scrambling is likely to be at getting into, not out of, the trains. The line passes through a pretty country, and carries us to a sweep of hills which, as the *Guide* says, "constitute a natural limitation to the already overgrown city." It may be conjectured that money has been invested in the Alexandra Palace under the hope that this natural limitation may be exceeded.

Of all possible motives for going into the country on what ought to be a spring afternoon, the last that would have occurred to us would have been the desire to see a ballet. But the newspapers inform us how much those have lost who were not present at the Alexandra Palace on Monday, on which day, as the *Guide* says, "the poor man can participate in all the enjoyments the Palace affords for sixpence." We learn that "the people" went down to Muswell Hill in large numbers on Monday, although it could not be expected that the attendance would equal that which witnessed the "inauguration of this new place of recreative amusement." We are of course glad to hear that the poor man can see for sixpence a ballet which competent authority pronounces to be at once charming and correct. The shareholders of the Alexandra Palace may possibly find their way—although we hope they may not—into a list of contributories under a winding-up in Chancery, but this will not prevent their names appearing in the noble roll of benefactors of mankind. But let us hear what those who evidently understand such things have to say about this ballet. In the first place, it was gratifying to observe so many little spectators waiting impatiently for the uprising of the crimson curtain behind which lurked fairy-like creatures and green-hued Tritons. We are far from clear that we should desire children to manifest eagerness to see a ballet, but that is matter of opinion. At three o'clock punctually the curtain rises upon the first tableau of *Azurine, or the Spirit of the Waters*. This ballet has a plot which, although slight, is said to be interesting, and it may be described by writers capable of handling such high themes. We shall not assume a task for which we feel ourselves incompetent, and besides, we labour under an impression that the plots of all ballets are alike. But even if this be true, this particular ballet differs from others in being made accessible to the poor man who can afford sixpence in addition to a third class fare by railway. We are indeed so barbarously ignorant as to suppose, not only that all ballets are alike, but that all have been alike from the time of the divine Taglioni, to whose perfection Madlle. Rita San Galli is said to approach most nearly of all successors. There is of course a young man who is betrothed to a maiden, and the course of true love is interrupted by the spirit Azurine. What would one give either to see this for the first time, or to be capable of admiring it after seeing it fifty times! When the piece opens, "upon a beautiful Styrian seashore scene," we should dread the access of an uncontrollable desire either to test the quality of the refreshments at the Palace, or to contemplate the view of London from Muswell Hill. If Styria has moved recently to the sea-coast, it is only natural that the "Nainds" of that country should have taken marine lodgings. "Joan, piqued at the protracted absence of her lover, is discovered with her father, mother, and a little sister." The errant sweetheart, Karl, who is a fisherman, arrives; "and, after a little coquetry, Joan forgives him." The *corps de ballet*, Joan, and Karl "engage in a Styrian dance," and a wedding seems imminent, when a storm, which contains Azurine, intervenes. We are given to understand that Madlle. Rita San Galli represents the love, hope, joy, despair, and other suitable emotions of the Spirit of the Waters in a style which has not been seen since Taglioni ceased to hold all mankind her slaves. "It would be worth while to visit the Palace if only to see this famous dancer," and perhaps it would be worth while to invite the famous dancer to appear at some place where we could see her more conveniently. There are also three English dancers, who have no superiors on our stage, and whose style is pronounced to be "artistic and ladylike"; which the critic thinks a great thing to be able to say in these days of abbreviated skirts and attenuated modesty. Of all possible professions, we should say that that of a male dancer was the least desirable. But the representative of the young fisherman has the satisfaction of hearing that his performance was "clever and energetic." The scenery is described in detail. There were "caverns of the sea" fitted and furnished in the highest style. In fact, the whole thing was admirable, and the wonder of wonders is that it should have been seen for sixpence.

The advocates of temperance ought to observe that on Saturday the counters at which wine and beer were sold were comparatively deserted, while the competition at other counters for tea and coffee was unpleasantly severe. Ladies who had not gentlemen to assist them waited an hour or more for refreshments, and when they obtained tea or coffee, they had to take it without milk, and if they could get sugar, they had to stir it with a parasol or any other convenient substitute for spoons, which were unattainable. This deficiency was the more remarkable because, with adequate machinery, the making and dispensing of tea and coffee may be performed rapidly and almost without limit as to quantity. These "innocuous beverages," as Mr. Bruce would call them, may be recommended for Palatial purposes for the same reasons that render them popular in the Australian bush. A cup of tea is a possible luxury at an early stage of civilisation. However, the *Guide* informs us that the Company feel confident alike in the bracing air of Muswell Hill to produce appetite, and in the capacity of Messrs. Bertram and Roberts to supply it. We learn from the same source that the Company consider themselves public benefactors, as they "have got hold of this ground and set it apart for the use of the people for ever." This feeling will be valuable to fall back upon in the possible absence of a satisfactory dividend. "The Park will be sacred from the grasp of the speculative builder as long as the Alexandra Palace stands." It is melancholy to reflect that, if the present enterprise does not succeed, the Palace will be useless; for we cannot conceive any purpose to which it can be put, unless it can serve as an appendix to Colney Hatch Lunatic Asylum, which, as the *Guide* tells us, can be seen from Muswell Hill. There is an interesting collection of pictures in the Palace, which might have been conveniently exhibited in the Albert Hall. There are, in truth, three nearly similar establishments on three different sides of London. There is the Albert Hall in the west, the Crystal Palace in the south, and the Alexandra Palace in the north. The managers of the first brag most loudly of their great patrons and their lofty aims, but in substance there is little to choose among the three. The *Guide* to the Alexandra Palace suggests that "by the side of the little lakes, or under the shade of the old trees" flirtation may be conveniently conducted; and in the building "Messrs. Jackson and Graham's fine display of furniture is worthy of the notice of all such happy couples as are inclined to marry and set up housekeeping." It is kind of this Company thus to promote courtship and matrimony, but half-a-million is a good deal of money to expend in facilitating processes which are apt to go on only too easily without assistance. In the grounds there is a banqueting hall, where a thousand persons can be entertained. "Londoners will there dine gally," but what a very melancholy place it will be when Londoners do not dine there! The whole thing resembles only too closely the Crystal Palace, and we should fear that at best it cannot be more prosperous than that not too flourishing institution. The casts of celebrated statues, including "quite a competition of Venuses," and even the square blocks of cake upon the counters, remind one vividly of Sydenham. The only difference that we can discover between the two establishments is that there is to be a sixpenny day at Muswell Hill. But surely the working-man who requires boiled fowl for his Sunday's dinner, and objects to feed frequently on veal, will not long consent to take his pleasure for sixpence on Monday. At any rate Messrs. Bertram and Roberts had better look alive when the "poor man" comes to try the "appetizing power" of the air of Muswell Hill. But if the "poor man" requires the relaxation of the ballet, Madlle. Rita San Galli will find patrons, although not exactly in the class which applauded Taglioni.

THE DERBY.

WHAT bade fair to be one of the most uninteresting of Derbies has been relieved from dulness by an unlooked-for surprise. After a long succession of disappointments that would have disheartened a less genuine sportsman, and just as he has announced his intention to dispose of his stud, Mr. Merry has for the second time carried off the great Epsom prize. No one will grudge so old and consistent a supporter of racing a triumph which comes, under the circumstances, so opportunely as to appear like a compliment paid by fortune to Mr. Merry on his retirement from the Turf. Yet, after seeing Doncaster beaten only a month ago by Gang Forward, Kaiser, Suleiman, and Boiard, in the Two Thousand Guineas, the most devoted adherent of the yellow jacket and black cap could not anticipate his ability to turn the tables so decisively on his conquerors. Not that Doncaster was unremarked at Newmarket. As we stated in our comments on the Two Thousand Guineas, he ran well enough, considering his backwardness, to deserve notice hereafter. But he was so backward, so very far from being in real racing condition, that it was impossible to imagine that in the short interval between the Two Thousand and Derby his preparation could be satisfactorily completed. Good judges who took note of his fine frame and powerful limbs mentally put Doncaster by till September, and were quite prepared to believe that he would distinguish himself on the Leger day. Even in the paddock last Wednesday he was comparatively unnoticed, for it was evident that he was still backward in preparation, and the critics, fully persuaded that his day had not yet come, rushed pell-mell in pursuit of Gang Forward, Kaiser, and Hochstapler. A few minutes later, and a half-trained horse was returned the winner of the Derby of 1873.

Training accidents, public defeats, acknowledged loss of form, and failures in trials have played fearful havoc this year with the Derby candidates; and at the last the field dwindled down to the insignificant number of twelve. Paladin broke down just when he was doing all that his trainer could desire; Negro, the Biennial winner, was struck out only a few days ago; Surinam and Leopard are both on the sick list; Sir Joseph Hawley had no representative to do credit to the last year of his racing career; and it was not thought worth while to start Apollon, though, as he might have beaten Boiard at Paris last Sunday, and Boiard beat Doncaster in the Two Thousand Guineas, we do not see why he should not have run into a forward position in the Derby. Thus the probable competitors became fewer and fewer

every day, till it was positively anticipated that there would not be more than eight starters. As it turned out double figures were reached; but, take them altogether, a worse field never started for the great race of the year. We will mention the most worthless of the twelve first, and spare ourselves from alluding to them again. Snail, by Esca out of Reveillée, and Meter, by Saccharometer out of Miss Fanny, had no business in a Derby field. The former is only noticeable from his appropriate name, which is fully justified by his performance. The latter is not only a non-stayer, but cannot go fast even for a short distance. Somerset, a horse of far higher class, is also a non-stayer, and, in addition, is infirm. He will probably never recover the form he showed last year in the July stakes; and if he did, he would never be able to get over a mile-and-a-half course. He walked in the paddock with extreme delicacy, as if afraid to put his feet to the ground; and it was evident that the chance of his breaking down in the race was much greater than of his winning it. Andred is another horse with a turn of speed, but deficient in stamina, and uncertain in temper. Beadroll was, of course, only started to make running for Gang Forward, a task which he fulfilled very imperfectly. Five out of the twelve runners are thus disposed of, and no further mention need be made of them. We come now to the fair public performers of the second class, who are now aspiring to higher honours. Suleiman won two Nurseries at Newmarket last autumn, but he beat nothing that has since attained to distinction. His forward running in the Two Thousand, when he finished third to Gang Forward and Kaiser, was a better credential of merit; and as he was running strong and well at the finish, though he had been in difficulties when coming down the hill, and as he displayed undoubted gameness, it was considered quite possible that he might make a better fight over the longer course at Epsom. Montargis has always been highly thought of since he ran third to Kaiser and Surinam in the Middle Park Plate, for he was not only in backward condition at the time, but was badly ridden into the bargain. Still, under every disadvantage, he finished only half a length behind the dead-heaters; and it was unanimously agreed that he would improve on that form at a future time, if brought fit and well to the post. A few months ago, however, he went amiss, but was reported to have recovered, and certainly his appearance in the paddock was highly satisfactory. The danger, however, of trusting to horses who have recently been on the sick list was again clearly shown, for Montargis was beaten half a mile from the finish, and had to content himself with the ninth place. Chandos jumped into fame by running away with the Bretby Plate at the last Craven Meeting from Azalea, Chopette, and Roquefort. There was not a handsomer horse in the paddock last Wednesday, nor one more fit to run. His breeding was against him, Oxford being notorious for getting non-stayers; but he carried the confidence of his party, and perhaps there was no horse in the race so strongly fancied for a place, which he very nearly succeeded in obtaining. Doncaster, as we have said, was as little noticed as Hermit six years ago. People glanced at him, and passed on with the remark that he would repay a closer inspection at Doncaster. The regret, subsequently expressed, that the opportunity for inspecting him had been missed, was natural. We come now to the three cracks —or rather the three presumed cracks—Gang Forward, Kaiser, and Hochstapler. No exercise of the trainer's art could have made the first and second in the Two Thousand fitter than they were last Wednesday. There were not two opinions about their condition and appearance; and those who looked at the gallant race they won at Newmarket prophesied with justice another desperate struggle between two as honest and game horses as ever faced the starter. About Hochstapler there was a fierce conflict of judgments. The professional horse watchers, the men who for years have been in the habit of detecting the least sign of weakness on the part of a horse in a momentary glance, and who, to do them justice, measure the standard of a Derby winner by certain rules which are generally sound and sensible, denounced him one and all. His forelegs were twisted and malformed; he could not walk; and he would be much more likely to come down on his nose in rounding Tattenham Corner than to win the Derby. On the other hand, his own immediate friends vowed that he was a second Gladiateur. Gladiateur had queer forelegs also; but what could touch him when once he got into his stride? So Hochstapler might not be a model of symmetry to look at, when looked at all over; but he was of far superior class to his antagonists, who, to say the truth, were none of them of the first class. In this last part of the argument we fully agree. We have always maintained that the three-year-olds of this year are below the average, and the Derby proves it more than anything else. But what were the real reasons which induced Hochstapler's owner and trainer to consider him a miracle of horseflesh are known to themselves only. As we pointed out at the time, his one public trial proved nothing. He beat Hurlingham and The Colonel over the Rowley mile by any number of lengths; but Hurlingham is the greatest impostor that ever found his way into the Derby quotations, and The Colonel is only a six-furlong horse. As far as appearances went, they were a good deal against Hochstapler. He walked badly and cantered badly; and though he was well trained, and well furnished with muscle, old racegoers could not swallow the idea of a horse with such action getting down the hill. Judging from what we saw in the Two Thousand, Gang Forward was not specially fond of a descent; but Gang Forward's legs were very much better shaped than Hochstapler's, and there was little fear of their giving way, though they might get shaken out of their regular stride before level ground was reached.

The time soon arrived when all hopes and fears were to be set at rest. With such a small field—and it not being a matter of supreme importance whether two or three of those got off well or ill or not at all—the starter had little difficulty. The flag fell only a few minutes after the appointed time, and Beadroll started off with the running at his best pace. He maintained his lead, though without exhibiting much power of speed, to the top of the hill, where he had to retire; and then Gang Forward had to shift for himself. As soon as they commenced the descent, Kaiser rushed to the front, and went down as hard as he could go, both for the purpose of trying how Hochstapler would like it, and also from some idea that Gang Forward also might be troubled by the increased pace at that particular point. Mr. Savile's horse was successful in both ways. Hochstapler could not get down the hill at all, and Gang Forward, though he got down it, did not like it, and blundered very nearly on his nose, losing a considerable amount of ground before he could be got perfectly right again. Kaiser, built, as we have always thought, to special order for the Derby course, bounded down the hill like a cricket-ball, and came on into the straight with a clear lead. He had, as he thought, got rid of his only formidable antagonists, Gang Forward and Hochstapler, when a third, Doncaster, appeared at his left hand, going along with an unconcerned stride, and requiring immediate attention. All that a horse could do to answer such a challenge was done by Kaiser; all that a rider could do was done by Kaiser's rider; but Mr. Merry's great powerful chestnut went on and won cleverly, but not by any means easily, by a length and a half. Gang Forward, after recovering from his mischance, had been set going again, and running with the indomitable gameness that has always distinguished him, caught up Kaiser in the very last stride, and made a dead heat with him for second place. Chandos was a fairly good fourth, and of the remaining eight we need only say that not a single one was ever dangerous for a moment. We may add though that our constant opinion about Hochstapler, that he would either win in a canter, or be very nearly last, was justified. If, as his friends said, he was a second Gladiateur, he was bound to win easily, for he had only second-class horses to beat; if his friends had made a mistake, there was no earthly reason why he should not come in last instead of first. As it happened, his friends had made a very great mistake, and he did come in very nearly last. Gang Forward and Kaiser have again proved themselves, what every one believed them to be, thoroughly good honest horses. In the Two Thousand they could hardly be separated; in the Derby the judge could not separate them at all. In the month between the two races there was a chance of Gang Forward's making greater improvement than Kaiser; but the different nature of the course at Epsom was sufficient to counteract this advantage. What Gang Forward gained in condition he lost by not being able to rattle down the hill to Tattenham Corner. But for his mischance at that point he would, we think, have beaten Kaiser in their places; and if he is fit and well in September, it is a certainty that he will beat Mr. Savile's horse in the Leger. But what chance will either of them have with Doncaster, if he makes such improvement between June and September as he has made during the last month? Confessedly a half-trained horse, not enjoying the confidence of his owner or trainer, even his starting for the Derby being a matter of doubt within a few days of the race, he has fairly beaten the two most approved and most trusty three-year-olds in the country. It is impossible that they can be made better, or that they can run better than they have run. In every race in which Kaiser has taken part he has been one of the first three; and what more can a horse do? His performances are, of course, limited by his powers; but his powers have always been honestly exerted to their utmost. The inference is clear. The three-year-olds are very moderate; below the standard of Cremorne, far below that of Blair Athol. An unprepared horse, held of little account in his own stable, has beaten the best of them without much difficulty. We are not going to exalt Doncaster to the skies. We are not prepared to say that he is, or will be, a first-class horse himself. If he is of such excellence, it would scarcely have remained so long unguessed in the Russley stable. Perhaps he is only a Triton among the minnows; at any rate we must see him in a Cup race with Cremorne or Favonius before accepting him as a racehorse of the highest standard. We may add that Doncaster was bred by Sir Tatton Sykes, was christened by the unearthly name of All Heart and No Peel—some obscure reference being intended to his parentage, by Stockwell out of Marigold—and was bought as a yearling at Doncaster by Mr. Merry, who promptly gave him such a name as might be properly enrolled in the list of Derby winners.

REVIEWS.

WEDGWOOD'S ETYMOLOGICAL DICTIONARY.*

MR. WEDGWOOD has put forth an edition of his Dictionary which is at once enlarged and compressed. There is more matter than before, but, by a different way of printing, it is got

* *A Dictionary of English Etymology.* By Hensleigh Wedgwood. Second Edition. London: Trübner & Co. 1872.

into a smaller compass, and the work now forms only a single volume. The comparatively short introduction to the former edition has grown into an essay of sixty-five closely printed pages on the Origin of Language. This alone may entitle the present edition to rank as a new work. We need not say that it is highly ingenious, but Mr. Wedgwood will hardly expect us to be converted by it. Only perhaps a question may be raised whether anybody needs to be converted at all. Mr. Wedgwood's favourite doctrine is well known; it is the formation of words by what is more grandly called "onomatopœia," but what Professor Max Müller merrily spoke of as the "pooh-pooh" and "bow-wow" theories. Mr. Wedgwood writes as an opponent of Professor Müller, but we cannot help thinking that the opposition is, to some extent, more apparent than real. That is to say, we do not see that their main principles are necessarily contradictory. Professor Müller does not deny that some words are formed by onomatopœia; Mr. Wedgwood, if we rightly understand him, does not maintain that all words are. Mr. Wedgwood damages his own cause by putting his case in a more unscientific form than there is any need for. In the first two pages he sets forth the doctrine of the relations of the Aryan languages in a shape that no one can find fault with. Where he breaks down is in not carrying the doctrine about with him as a living thing. It is a doctrine which may quite well be held alongside of the doctrine of onomatopœia. Let us take any Aryan root, say the root *vid*. When we have traced all the various cognate forms up to the root, there we stick; we can get no further. We see that *vid* means to *see*, and therefore to *know*, but we cannot say why it should mean to *see*. If Mr. Wedgwood can tell us, we shall sincerely thank him. If he can show us how *vid* came to have the meaning of seeing, whether by onomatopœia or by any other process, we shall not have to give up one tittle of what we have already made out by the Comparative method; we shall only have learned something else into the bargain. Now if there is—what we do not see in this particular case, but what we are far from denying seems to be very likely in some other cases—any physical reason why *vid* should mean the act of sight, we should not be at all startled to hear that some other family of mankind besides the Aryans have given the same name to the same process. If it should so happen that this or that root is common to Aryan and Semitic, or even to Aryan and Turanian, the fact is in no way inconsistent with the Comparative doctrine. No Comparative philologer denies that, beyond the tie which binds together the Aryan, the Semitic, or any other family of languages, there may be a further tie binding two or more families together. To show that single households form a *gens* is quite consistent with holding that several such *gentes* may come together as a tribe. And again, as like causes produce like results, if the onomatopœic process suggests itself to one family of languages, it may also suggest itself to another. In either of these ways it is not at all wonderful if we should light upon the same root in families of languages which seem most remote from one another. All that we ask is that the discussion be carried on *per stirpes* and not *per capita*. No single member of any family must be allowed to have any dealings with any single member of any other family; all negotiations must be carried on between the common federal powers on both sides. We must not take a word in one language and assert for it a connexion with a word in some other language of another family, unless there is some historical evidence that one of the two languages borrowed it from the other. If a word seems to be common to two languages of different families, the scientific process is to trace it back to its root in each family, and then we shall be able to judge whether the likeness is real or only apparent. It may turn out that the root really is common to both families, either by virtue of a more remote connexion between the two, or because each family, as in a case of onomatopœic formation is very likely, has hit upon it for itself. But it may turn out that the likeness, however tempting, is purely accidental.

This last is the chance which Mr. Wedgwood seems unwilling to face, and the whole process is one of which he is clearly impatient. We may grant to him that Professor Müller may very likely have gone too far in despising onomatopœia, because, as we have shown, onomatopœia is perfectly consistent with the Comparative method. But Mr. Wedgwood, on the other hand, after beginning with a clear setting forth of the Aryan doctrine, goes on in practice to forget or ignore it. The particular articles in his Dictionary are not put together on any more scientific principle in the new edition than they were in the former one. In the greater number of cases there is really no attempt to give anything like a history of the word; when there is, it is rather a history of the use and meaning of the word than strictly of its etymology. Our notion of the way to make an etymological dictionary, such a one as we greatly desire to see, would be to take the modern form of each word—to trace it back through the various stages of English to the earliest form that can be found in our own language—then to give its cognates in other Teutonic languages, then its cognates in other Aryan languages. When we had thus got up to its earliest known Aryan form, we should be in a position to judge whether it had any non-Aryan cognates or not. Of course this would make rather a long story, but the different stages of the process need not be done at all on the same scale. The history of the word within our own language should be dealt with more fully than the Teutonic cognates, and the Teutonic cognates more fully than the non-Teutonic. As for words of Romance origin, those which really are words, which are really naturalized, which we cannot now do without, and whose history is sometimes doubtful and sometimes instructive, would of course find a place. But in an English etymological dictionary it would be quite enough to trace them back to the point at which they made their way into English, carefully pointing out the stage of our language at which they come in, and distinguishing those which came straight from the Latin from those which came through earlier or later stages of French. But as for that great mass of French and Latin words which, however useful for their own purposes, are not, in any philological sense, English words but merely technical terms, an English etymological dictionary has nothing to do with them. To come back to our pet illustration, it should carefully mark the difference between *candle*, *chandler*, and *chandelier*, because the different stages at which those words were adopted make part of the history of the English language. But the writer of such a dictionary need hardly trouble himself with the history of such words before they entered the English language. Thus the English received the word *candle* from the ready-made Latin word *candela*. The connexion of *candela* with *candere*, and with anything else to which *candere* may lead us up, is an affair for the historian of Latin, but not of English, etymology. Now Mr. Wedgwood attends to nothing of all this. He has an entry "*Candle.—Chandelier*. Lat. *candela*. Fr. *chandelle*, from *candere*, to glow." Again, under *Chandler*, he tells us, "Fr. *chandelier*, dealer in candles." He goes on to point out the way in which the word has been wrongly applied to other trades, as when people talk of a corn-chandler, and he helps us to a word which we did not know, and for which we thank him—namely, the *chandry*, or place where candles are kept. But he does not stop to point out, what a dictionary of English etymology surely should point out, that *candle* came straight from the Latin at a very early stage of our language, while *chandler* and *chandelier* both came from the French at stages, as the different pronunciation shows, with a wide interval between them; and, if any one chose, he might point out how, in a yet later stage still, we have fallen back on the Latin and taken in the word *candelabrum* bodily.

With purely English words, Mr. Wedgwood's way too often is merely to throw together a great number of cognates, or possible cognates, without any attempt at marking out the different stages and different degrees of distance. Some words are strangely left out altogether, as *head*; yet one would have thought that no one could have withstood the temptation of tracing *head* through *heved* up to *heafod*, of pointing out its absolutely perfect analogy with *caput*, and of saying something about *haupt* and some other words. Then again, *lord* and *lady*, two words of the greatest difficulty, and therefore of the greatest importance, in English etymology, are cut wonderfully short:—"*Lady*. A.S. *hlæfdig*," though in the opposite page we actually have a quotation under the word *lad*. "When *laddes* weddeth *leedies*," while under *lord* we get only "*Lord*. A.S. *hlaford*, O.N. *lavaudr*."—on which latter form it would have been well to have enlarged a little, but then these are words out of which it is not very easy to make out any doctrine of onomatopœia. Mr. Wedgwood always seems much happier when he gets hold of a word which may not have so much history about it, but where he can put together a theory about *fizz*, *buzz*, *puff*, and that kind of thing. We do not profess to know whether *ire*, *ira*, "is in all probability a representation of the snarling sounds of quarrelling dogs"—a view which Mr. Wedgwood works out at some length; nor, when dealing with English etymology, are we greatly concerned to learn that certain Finnish words seem to be formed on the same principle. But we should have eagerly seized on the opportunity of pointing out that *ire* is a perfectly good English word, cognate with the Latin *ira*, but not derived from it. Mr. Wedgwood does indeed give the Old-English form *irre* or *yrre*, but he puts it at the end, while the Latin and Old-French are put in the front. So again under the word *bull*, we are rejoiced to find the Lithuanian *bullus* quoted; but we could really have dispensed with anything about a Pope's *bull*, where the Latin *bulla* in its latest sense is, as far as English is concerned, a primary fact. But *bulla* is primarily a *bubble*, and *bubble* may be easily connected with *bullire*. So Mr. Wedgwood flies off at that tangent, and has much more to tell us about the Pope's *bull* than he has about the beast, and this though he quotes the North Frisian *bolli* and the Swiss *bullen* in the sense of *bellow*, words which there would be a very fair excuse for connecting with the bellowing animal.

Scattered up and down Mr. Wedgwood's Dictionary is a great deal of curious and valuable matter, notices of obsolete and dialectic forms, illustrations of the changes in the meaning of words, besides the onomatopœic suggestions which we are very far from casting aside in a lump. The book therefore has a real value for those who are already used to the scientific treatment of the subject, and who will find in it many facts that will be of use to them. But the facts come so confusedly and capriciously, there is such an utter lack of order in the arrangement of the cognate forms, even when they undoubtedly are cognate, there is so little attempt at a real philological history of any English word, that to a student who is only beginning the book cannot fail to be misleading. Mr. Wedgwood does not take the least pains to distinguish the degree of distance between the various cognate forms of the words which he treats of. Low-Dutch is nearer than High-Dutch is nearer than Latin, Celtic, or Lithuanian; but Mr. Wedgwood jumbles them altogether with the older forms of English thrown into the heap, as if the relation between an elder and a newer form of English were the same as the relation between an English and a Lithuanian word. Then we get a great deal of Finnish, but very

little Sanscrit; whereas, according to our doctrine, we have no right to compare anything Finnish at all till we have got at the earliest Aryan form of the word, for which we must of course commonly, though not necessarily, look to the Sanscrit. In short, from our point of view, the whole thing is unscientific. This new edition is in this respect no advance on the first, and it is to our mind needlessly unscientific; for we will end as we began with saying that Mr. Wedgwood's doctrine, if kept within reasonable bounds and not pushed to any absurd extremes, is not in itself inconsistent with the results of Comparative science.

TYERMAN'S OXFORD METHODISTS.*

THAT prince of critics, Richard Bentley, characterized one of his great predecessors in the Mastership of Trinity as "the excellent Bishop Pearson, the very dust of whose writings is gold." Mr. Tyerman seems to believe that the sweepings of his own study are of the same precious metal, and has embodied in this volume "some portions of a large amount of biographical material" which he had collected when compiling his *Life and Times of John Wesley*, but was compelled by want of space to lay aside on that occasion. "Other portions," he informs us, "may be published at a future time"; that is, we presume, unless his publishers and the section of the public for whom they cater shall be found to have heard enough about Methodism and the Methodists, according to his version of their history and of the nature of their influence, past or present, on the religious mind of England.

Mr. Tyerman's biography of the Apostle of Methodism has been reviewed by us on three several occasions (December 3, 1870; January 29 and July 29, 1871), and needs no special notice here. Seldom indeed have loving admiration and praiseworthy diligence presented a more lifelike picture of any man than his disciple has afforded us of John Wesley; seldom, too, it must be added with sorrow, has a considerable work been more marred and disfigured by the poverty of a slipshod style, by narrow bigotry, by dogmatical judgments respecting matters of which the writer displays an amount of ignorance which is really astonishing. This "Life of Wesley" must be studied by every one who seeks an insight into the character of the mighty preacher and his times, yet its author has done his best to make it utterly unreadable. The present volume professes to be but a sequel to his previous labours, a mere shaking of the tree when the gleaning is over; nor can we assert that it has any considerable or independent value of its own. All the blemishes of his earlier work are to be found here in rich abundance. The English clergy are as "envious and malignant" as ever; Zinzendorf, the Moravian "Papa," is a veritable "pope," his language full of "effrontery," his books of "repulsive jargon"; the society over which he presided breathes a murky atmosphere of religious clouds (p. 187). This writer still talks of the "fat incomes" of the bishops in a tone of which Mr. Miall might be ashamed (p. 85), while yet he knows so little of the constitution of the English Church as to call the Bishop of London its highest dignitary (p. 134). For "ritualism" and "high-churchism"—his pages overflow with these barbarous nicknames—he has a complete rosary of uncharitable prayers that their votaries, "laying aside their popish follies and proud pretensions," may embrace the truth as approved by Mr Tyerman "in its simplicity and its purity" (Preface, p. vii.) While we have among us what in solemn irony are termed "religious newspapers," we suppose that the public taste must of necessity be corrupted, and Christian good-will impaired, by vulgar balderdash like this. The marvel is how such a person as our author, presumably of pious life and decent manners, can dream that any worthy purpose will be answered by dipping his blunt pen in the very gall of bitterness, and by pointing the finger of scorn against men, fallible as himself and perhaps mistaken, who yet would fain serve the common Master as truly as he.

We think it fit to say thus much once for all of Mr. Tyerman's tone and spirit, not in the hope of being of any use to him, for experience has taught us that he is wholly incorrigible, but by way of apology to the reader who may look into his book on our recommendation. For it cannot be denied that he has collected material which is interesting to those who watch the ever-changing phases of theological opinion, and has revived the memory of a few earnest men whose contemporary reputation exceeded their intellectual power, yet who scarcely merit the oblivion into which they have fallen. Of the five names which stand on his title-page, the one most familiar to us is doubtless that of James Hervey—"The Literary Parish Priest" is the appellation by which our author distinguishes him. To his brief and uneventful life of forty-four years (1714–1758) nearly a third part of the present volume is devoted, though we do not quite understand why he, a decorous and orderly beneficed clergyman, should be reckoned in the number of the "Oxford Methodists" simply because he consorted with them when an undergraduate of Lincoln College, and kept up a friendly intercourse with some of their leaders to the day of his death. Infirm health and a thoughtful disposition fostered his natural love of learning, which was tempered and elevated by habits of early piety. Mr. Tyerman inserts a long letter addressed by him from Oxford to his sister when he was only nineteen, "in that flowingly harmonious style which was one of the chief characteristics of all his publications" (p. 205). It is full of spiritual promise, which his subsequent career abundantly realized, but, if we take our author's word for it, "it is thoroughly unevangelical," being "written at the time when Hervey first united himself with Wesley and his Pharisaic friends." If their Pharisaism only prompted them to shun evil-speaking, we would rather cast in our lot with them than with their censor.

Among his many acquirements we are informed by the Rev. John Ryland, a preceding biographer, that Hervey "became one of the first scholars in Europe for a familiar knowledge of the Hebrew Bible" (p. 212); which is much to say in an age that produced Bishop Lowth's famous *Lectures on Hebrew Poetry*. In this sacred study he had John Wesley for his teacher, having previously got hold of the *Westminster Hebrew Grammar*, of which he could make nothing. "That book," plaintively writes Mr. Ryland, "seems to be contrived by the devil to prevent the learning of the Hebrew language; it is dark and obscure, harsh and unpleasant, ugly and disgustful, dull and listless" (*Ibid*). Possibly Ryland was a Westminster boy himself, and, if so, he ought to know; otherwise we should have thought that the *pair body* to whom he refers the authorship might have found other employment than that of compiling bad grammars to perplex and torture ingenuous youth. Yet it was not as a scholar that Hervey became best known, but rather as a diligent, godly, painstaking parish priest. As a curate at Bideford and elsewhere, then in his own inherited livings of Weston-Favel and Collingtree in Northamptonshire, he did the work of a true evangelist in spite of bodily weaknesses which made him seem a dying man all his life long. He was never married save to his holy work, and of his extemporary sermons, full of tenderness and simplicity, very few have been preserved. His most ambitious literary performance, *Theron and Aspasio* (1755), a dreary dialogue in three volumes on justification by faith and the doctrines akin to it, had a prodigious sale at the time, and is sometimes met with in old-fashioned libraries, but will never be read through again. This publication embittered his latest years by bringing him into collision with his old friend Wesley, who would at all times rush upon whatever savoured of Calvinism as a wild bull on a red rag. He is best remembered by an earlier and less elaborate performance, *Meditations Among the Tombs* (1745), suggested by an excursion from his curacy of Bideford to the fine old church of Kilkhampton, in the north-east corner of Cornwall. In this juvenile work more especially, his style is as bad as can well be imagined; inflated, luxurious, exhibiting every fault that an inexperienced writer would be taught to avoid. But he has treated a subject of universal interest in an impressive manner; the prevailing tone of contemplative melancholy has charms for most readers in some conditions of the mind, while here and there breaks forth a certain luscious eloquence which is not artificial. We do not hold with Mr. Tyerman when he says of Hervey's books that "few are greater favourites at the present day" (p. 200); but some of his finest passages, such as his apostrophe to Sir Bevil Grenvil, the hero of Lansdowne field, are not unworthy of more enduring fame than they are likely to vindicate for themselves in the crowded pages of English literature, where all that is not of the best must ere long become the prey of dumb forgetfulness.

Mr. Tyerman devotes another hundred pages of his volume to a person whose very existence we had almost lost sight of, the Rev. Benjamin Ingham (1712–1772), "the Yorkshire Evangelist." The sect of the Inghamites, of which he had the sorry distinction of being the head, has now almost vanished from the face of his native county, where it once overshadowed Wesleyanism itself. From an early period, however, the growth of this denomination was stunted by the too close vicinity of the Glassites or Sandemanians, the very narrowest of all separatist communions, even now not wholly extinct, and among whom Michael Faraday was bred, and lived a member and an office-holder. The illustrious philosopher who put all nature to the question never found time or inclination to ask himself whether the Supreme Being whom he devoutly served was indeed a respecter of persons. We return to Ingham, who was an undergraduate of Queen's, and about twenty years old when he first joined the holy brotherhood at Oxford. He had not been long ordained before he received from John Wesley a letter whose substance was this:—"Fast and pray, and then send me word whether you dare go with me to the Indians." He obeyed the call, and accompanied John and Charles Wesley on that ill-starred mission to Georgia; wherein, by the exercise of a little common sense, he obtained more influence and consideration than those he had hitherto taken for his guides. In thirteen months, however, he left the colony to encounter contradiction at home. "At a Church congress held at Wakefield, June 6, 1739," as Mr. Tyerman informs us, "Ingham was prohibited from preaching in any of the churches in the diocese of York" (p. 90); we were not previously aware that Church Congresses existed at that period, or that they possess even now such summary coercive jurisdiction. Be that as it may, he had now to exercise his ministerial function in any place he could make available. "Village greens, the public streets, fields, barns, cottages, and houses of all descriptions became his preaching places," so that not fewer than forty religious societies were formed by him at this time. Hitherto he had been on terms of close intimacy with the Wesleys, but their union was soon to come to a disastrous end. The elder of the brothers exacted from his

---

* *The Oxford Methodists: Memoirs of the Rev. Messrs. Clayton, Ingham, Gambold, Hervey, and Broughton; with Biographical Notices of Others.* By Rev. L. Tyerman, Author of the "Life and Times of the Rev. S. Wesley, M.A."; and the "Life and Times of the Rev. John Wesley, M.A., Founder of the Methodists." London: Hodder and Stoughton. 1873.

followers more dutiful respect and compliance than Ingham was willing to bestow; and to this source of dissension was added the varied relations in which they now stood to the Moravian Brethren, who had virtually expelled John Wesley from their body, while Ingham still clave to them, though he too left them at last. Page after page of Mr. Tyerman's volume, as indeed of his *Life of the Founder of Methodism*, is full of the dismal controversies, the mutual recriminations, the bitter reproaches of those who had begun to run the good race together, and had subsequently parted in anger and malice. Whitefield kept himself as clear as any one from these most unedifying disputes, for his was a meek and candid spirit, but even he was at times betrayed into conduct which he afterwards looked back upon with deep remorse. As to Ingham, we fear he was no less blameworthy than the rest, yet he has been spoken of as emphatically a gentleman. When he was young, his handsome person and agreeable address commended him to one of his converts, twelve years his senior, the Lady Margaret Hastings, sister-in-law to the famous Selina Countess of Huntingdon; nor had she cause during many years of wedded life to regret her union with the clergyman who took broad Yorkshire for his parish. When she was gone the widower's sun went down in gloom. The decaying state of the societies he had set up distressed him sorely, as though it were a personal calamity. "I am lost! I am lost!" was his despairing cry; he seemed to himself to have lived and toiled in vain.

The next worthy on Mr. Tyerman's list was of a braver and more cheerful temperament, John Gambold (1711–1771), of Christ Church—Bishop Gambold as our author calls him, for he had accepted that title from the Moravian body in England after Ingham had forsaken it, and for seventeen years he bore the not overwhelming "honours of his office with humility and diffidence" (p. 194). Gambold, too, had become acquainted at the age of nineteen, first with Charles Wesley, who was a student of his own college, then of course with John, who, as he writes, "has been the instrument of so much good to me that I shall never forget him" (p. 157). Like the rest of the pious troop, he visited the city prisons, was fruitful in prayer and exhortations, took orders early, and spent ("almost wasted!" p. 163) four years as vicar of the sequestered village of Stanton-Harcourt, finding there ample leisure for literary and philosophical studies. Much about this time, nay even after his intercourse with the Moravians had revived his love for spiritual truth, Gambold composed a tragedy entitled the *Martyrdom of Ignatius*, which grievously exercises Mr. Tyerman, and drives him to strange subterfuges indeed. As a specimen of our biographer's style, we subjoin his lame apologies for this awkward fact:—

> It certainly seems somewhat strange that an earnest young clergyman, twenty-nine years of age, and only recently brought to the enjoyment of personal salvation by penitent faith in Christ, should employ his time and pen upon a dramatical production; but it must be borne in mind—(1) that from his youth Gambold had had a great fondness for dramatic pieces, both ancient and modern; (2) that Gambold's tragedy was never intended for the stage; (3) that its sentiments are unexceptionably pure and good; and (4) that he was not the first who had attempted to represent the principles and practices of the Christian religion in such a form.

To these pleas we will only add (5) that, though graceless enough to write a play, he had not the hardihood to publish it. It first appeared in 1773, a third of a century after it was written, and two years after its author's death.

Several others of the "Oxford Methodists" are more slightly commemorated in this volume, as William Morgan of Christ Church and Robert Kirkham of Merton, who in November 1729 formed with John and Charles Wesley the nucleus of the party "by spending some evenings of the week together in reading, chiefly the Greek Testament." With one Rev. John Clayton (1709–1773), "The Jacobite Clergyman," as Mr. Tyerman calls him, we were not previously acquainted. He laboured and died successively Chaplain and Fellow of the Collegiate Church at Manchester, and had first persuaded Wesley in 1732 to take up his practice of fasting twice in the week. The chief use he serves to his biographer is as a peg on which to hang a series of protests against "ritualism" and "priestly pretension" and "parochial pride," for Clayton had left the Wesleys as soon as he perceived to what they were driving. "Coldness sprang up and separation," nothing worse.

The brief memoir of Thomas Broughton, "The Faithful Secretary" of the venerable Society for the Promotion of Christian Knowledge, is important chiefly because some of Mr. Tyerman's readers will here learn for the first time what he very rightly is careful to impress upon them, that this association "had the honour of being the pioneer of some of the greatest movements of the present day. It distributed Bibles long before the British and Foreign Bible Society existed," and numbered among its missionaries the apostolic Schwartz. Broughton had joined the Methodists at Exeter College in 1732, and in London was conspicuous for his zeal in ministering to condemned malefactors up to the moment that they suffered. He also, in the course of time, received the benefit of the Wesleys' left-handed prayers. "I was much assisted to intercede for poor Mr. Broughton," writes Charles in 1738, "who continues the very life of all those who oppose the faith" (p. 343).

The short lives of the Wesleys' clerical brothers-in-law, John Whitelamb and Westley Hall, especially of the latter, might very well have been spared, the rather as all that was worth knowing about them had already been told in the "Life" of the Founder. For John Whitelamb we must confess a hearty liking; we doubt not that he was, what his tombstone, raised by a stranger, declares, "worthy of imitation." The poor charity boy of Samuel Wesley's smaller parish of Wroote was promoted by the old rector's generous kindness and his own towardly parts, first to an Oxford education, next to his patron's little living, and the hand of his afflicted daughter Mary. He lost all he had toiled for by the death of his wife within one year; then patiently dragged on life as an obscure country parson for more than a generation longer; making from time to time his timid approaches to imperious John Wesley, yet always flung back again, and finally dismissed in a single paragraph by one whom he professed to serve in all things, "provided conscience be not concerned." We subjoin the great man's version of the poor fellow's epitaph:—

> 1769, October 4. How long is it since Mr. Whitelamb died? What disease did he die of? Did he lie ill any time? Do you know any circumstances preceding or attending his death? Oh, why did he not die forty years ago, while he knew on whom he believed! Unsearchable are the counsels of God, and His ways past finding out.

They are so, indeed; and not the smallest mystery which disturbs the reflecting mind is this, that men who are willing to give up ease and substance, and the blessings of social life, for the furtherance of what they hold to be the truth, should thus pursue each other with deadly enmity, and launch forth invectives from which the most worldly abstain for mere self-respect; forgetful all the while wherein it is written, "Though I give my body to be burned, and have not charity, it profiteth me nothing."

BRET HARTE'S WORKS.*

IT is about two years since Mr. Bret Harte became known to the English public by the *Luck of Roaring Camp*, a collection of Californian pictures which we noticed at the time at some length. The success achieved by these tales was followed up by the *Heathen Chinee* and its companion pieces, in which the writer showed himself a humourist—and this in the wide sense of the term which includes humanity and pathos—in poetry as well as in prose. Other productions were gradually added, mostly, but by no means exclusively, distinguished by the novel Western colouring which had at first attracted attention. The latest piece in prose, "Mrs. Skaggs's Husbands," takes us back to the Californian camp life; on the other hand, the latest pieces of verse—"Concepcion de Arguello," and the lines on the fire of Chicago—are as regular in language and form as if Mr. Longfellow had written them. The collected whole makes up a good-sized volume, which, if manipulated according to the usual ways of publishers of English poetry and fiction, might easily be spread into three or more. In some ways the contents are of unequal merit; but most of them are good, and some things are unique. The impression we receive on the whole confirms the judgment which we had formed step by step from the several parts as they appeared—that Mr. Bret Harte is a storyteller and poet of true genius. It would be a great mistake to infer from his popularity at railway bookstalls that he is a mere compiler of extravagant jests and adventures. What we do infer is that railway travellers will read good books if only they are made cheap. Even the somewhat blatant advertisements with which the English publisher has thought fit to herald these works may annoy, but will not deter, the reader who is accustomed to see with his own eyes.

Perhaps the most eminently distinctive feature of Mr. Bret Harte's manner is suggestiveness, a quality in which, we think, his writing is hardly to be surpassed. By this we mean the power of suggesting definite, not indefinite, ideas. It is not uncommon to find in modern authors, especially in some of our latest poetry, collocations of fair-sounding words which seem to answer to some vague emotion, but convey no positive meaning, and which are called suggestive because they fail to suggest anything in particular. This kind of vague suggestion may have its artistic uses, but obviously requires a very fine artistic discretion in its use. Mr. Bret Harte's way is quite different. With a few touches, thrown in as it were by accident, he describes remote or trivial consequences so as to carry our thought at once to the centre of the action. Nor do we come to resent this as a trick of manner; partly because Mr. Bret Harte knows how to apply it with infinite variety, partly because it is really not artificial, but founded on the truth of human nature. We do, in fact, learn a good part of the things which are important to our actual life by some such incidental and roundabout intimations. It would be difficult to find anywhere a more complete and condensed dramatic picture than in the short poem entitled "Jim." The story of an old friend lost and found comes out in broken sentences, in which the speaker's true emotion, being shamefaced, as the manner of our English race is from East to West, disguises itself in abrupt questionings and casual expletives. The last two stanzas, containing the discovery—which any one who thinks they want to be made classical may call by the technical name appropriate to these situations in Greek tragedy—are wonderful for what they say in a few words:—

> Dead!
> Poor—little—Jim!
> —Why, thar was me,
> Jones, and Bob Lee,
> Harry and Ben—
> No-account men:
> Then to take *him!*

* *The Complete Works of Bret Harte, in Prose and Poetry.* With Introductory Essay by J. M. Bellew. London: J. C. Hotten. 1873.

Well, thar—Good-bye,—
No more, sir,—I—
Eh?
What's that you say?—
Why, dern it!—Sho!
No? Yes! By Jo!
Sold!
Sold! Why, you limb,
You ornery,
Derned old
Long-legged Jim!

The same power comes out very conspicuously in the story of "Mrs. Skagg's Husbands." Skaggs is a sufficiently unpromising name to begin with. It strikes us as a nice question whether Mr. Matthew Arnold might not find it even more ominous for the future of our language and culture than Wragg. Certainly Diane de Lys or Lucrezia Borgia sounds better. And Mrs. Skaggs and one of her husbands are not seen at all; the husband who does not appear being the one by whose name we hear of her. Something is said, but most is inferred from the conduct of the persons whose misfortunes she has made. And we venture to say that nevertheless Mrs. Skaggs ought to take a permanent place among the sinister and terrible figures of modern fiction. This tale has appeared in a French version in the *Revue des Deux Mondes*, as did also, if we remember rightly, some of the former ones. Mr. Bret Harte's reputation is therefore not confined to readers of his own language.

The purely humorous aspect of Mr. Bret Harte's writings is both the most familiar, and perhaps the most difficult to give an account of, but we cannot pass it over. The curious irony—using the word in its original sense of under-statement—which runs through the whole is generic rather than individual. But our author embodies it in a quiet easy flow of verse peculiar to himself, which sets it off admirably. "Truthful James's" account of the dispute in the scientific "Society upon the Stanislow" is in this way irresistible:—

Now I hold it is not decent for a scientific gent
To say another is an ass,—at least, to all intent;
Nor should the individual who happens to be meant
Reply by heaving rocks at him to any great extent.

Then Abner Dean of Angel's raised a point of order—when
A chunk of old red sandstone took him in the abdomen,
And he smiled a kind of sickly smile, and curled up on the floor,
And the subsequent proceedings interested him no more.

"That Heathen Chinee" is too well known to require any gloss from us. The guile of Ah Sin under his "pensive and childlike" bearing, Bill Nye's lofty indignation as the champion of virtue and native labour, and the judicial calmness of his partner who tells the tale, make up a sort of diminutive burlesque epic of the collision between the extreme Eastern and the extreme Western race of mankind. And the piece has this quality—a pretty sure test of versification at all events—that it will not leave us satisfied till we know it by heart. Mr. Bret Harte's metrical effects are very curious; with the appearance of carelessness there is really much art. Sometimes there is a dash and sweep very like Mr. Swinburne's lyrics. One poem, "Dow's Flat," is in the very stanza lately chosen by Mr. Swinburne for one of his most ambitious and sustained flights. It tells of one Dow, who, after a long run of "powerful mean" luck, sought in vain for water in his dried-up well. What he found is best said in his own words:—

It was *gold*,—in the quartz,
And it ran all alike;
And I reckon five oughts
Was the worth of that strike;
And that house with the coopilow's his'n,—which the same
isn't bad for a Pike.

That's why it's Dow's Flat;
And the thing of it is
That he kinder got that
Through sheer contrairiness:
For 'twas *water* the derned cuss was seekin', and his luck
made him certain to miss.

That's so. Thar's your way
To the left of yon tree;
But—a—look h'yur, say?
Won't you come up to tea?
No? Well, then the next time you're passin'; and ask
after Dow,—and that's *me*.

With so much genuine native power at his command, it is a pity that Mr. Bret Harte should ever be led away to become a comparatively ordinary comic writer in a field which does not suit him. This is the case however in the "Sensation Novels," a performance not only relatively but absolutely weak. There are good points scattered here and there in the various imitations, especially in that of Dickens, whose style Mr. Bret Harte has really studied—so much indeed, that its influence is a little too visible in his serious writing. But, on the whole, the parodies are forced and unsatisfactory; the more so when we remember the excellence of Thackeray's *Novels by Eminent Hands*, which all but amounts to a standing prohibition against any attempt to do the same thing after him. The travesty of *Lothair* in another part of this volume likewise fails to do any justice either to Mr. Disraeli (for a good parody ought to have at least a fair show of justice) or to his parodist.

We are glad to turn from Mr. Bret Harte's one failure to the success he has achieved on his proper ground. His Californian tales, beyond their interest as works of fiction, have a truth which, if not exactly literal, is better than much that passes for historical truth, and whereby they will one day be valuable material for history. They give us a picture, everywhere so striking and consistent that even without confirmation—which, however, is not wanting—it must be accepted as faithful, of a strange transitory phase of civilization which already belongs to the past. We see how a society with laws of its own—somewhat odd laws indeed, but still recognized laws—is unexpectedly evolved out of the concourse of apparently lawless individuals. In the process ancestral traits come out for which we have to go back over centuries if we want to find them in Europe. The state of things depicted by Mr. Bret Harte resembles nothing so much as the manners of our kinsfolk in Iceland a thousand years ago as preserved in the Sagas. Gunnar and Grettir would have been quite in their element at Roaring Camp or Sandy Bar. There is the same light esteem of human life, with its consequences modified by a conventional code of honour and a rough but well-marked sense of justice and fair dealing between men. The scientific student of human nature may regret that in California the experiment could not be fairly worked out, but of course it is inevitable that the outlying posts occupied by the irregular advanced guard of a conquering race should be overtaken by the movement of the main body, and civilized from outside before they have done civilizing themselves from inside. And of course what they do for themselves is not a fresh construction out of unformed matter, but a reconstruction out of disintegrated organic elements. Still it brings into startling proximity phases of human nature which in the ordinary course of things are widely separated in both space and time. Once or twice this confusion of different stages of civilization has led Mr. Bret Harte into something like false sentiment, as when he relates the summary trial and execution of one Tennessee for highway robbery at Sandy Bar. He uses the beauty of the midsummer morning to draw a contrast, and talks of "the weak and foolish deed." This looks like a hesitation between the points of view of the camp and of the city. If the men of Sandy Bar are to be judged as citizens living under a regular government, their conduct was much worse than weak or foolish; if (according to the real state of facts described) we look on them as members of a nascent community practically compelled to find all the means of self-preservation for itself, we do not see what else they could have done. It is not as if their proceedings were tumultuous; they act under a sense of public duty, and their justice, if not very refined, is incorruptible. And the fact that the judge, when he intercepted Tennessee's flight in his unofficial capacity, brought him up for trial instead of "shooting him at sight," marks a distinct step in social advance. However, the feeling expressed in these tales is for the most part thoroughly true and genuine. An idea dwelt on more than once is the humanizing influence of children among these wild natures. The *Luck of Roaring Camp*, of which we gave a detailed account on a former occasion, is founded on this; and in the later story, "How Santa Claus came to Simpson's Bar," we hear how the leading man of the camp rode hard all night, fought with a highwayman, and forded a swollen river, to bring a Christmas gift for a sick child. Another admirably told story of a different kind is "Brown of Calaveras," which curiously illustrates the rules of conduct rigidly and even punctiliously acted up to in that strange society by men who at first sight seem mere outlaws. It reminds us of the Arab robber who turned and left all his booty when he had by mistake taken up and tasted a lump of the owner's salt.

Something ought also to be said of Mr. Bret Harte's more serious poems, which deserve more consideration than we have left ourselves space to give them. We may mention one success in a department where success is not common. War songs are certainly the weakest point of modern verse, notwithstanding some brilliant exceptions in Germany. Mr. Bret Harte's lines called "The Reveille" are a marked addition to the exceptions, and we think a fair match for anything in the *Lieder zu Schutz und Trutz*.

It does not appear whether this edition is published with the author's consent or not. We cannot help thinking that, if Mr. Bret Harte had been consulted, the volume would have been more carefully printed, and perhaps would not have been disfigured by vulgar and inappropriate woodcuts. As far as strict right is concerned there is nothing to be said, and we believe Mr. Hotten has his own theories as to the comity of nations in these matters. Anyhow we do not know of any more authentic English reprint of these works, and we must be content to take them in the only shape we can get.

ALEXANDER VON HUMBOLDT.*

(Second Notice.)

BY the death of his mother Alexander von Humboldt, who in deference to her wishes had made the study of law and the public service his main object of pursuit, found himself free to follow henceforth the bent of his own tastes and inclinations. With ample means at his command, with intellectual powers trained in the highest and most varied systems of the day, and developed by contact with the most thoughtful, able, and aspiring minds, the time was come when he could realize those schemes of world-wide travel and of the study of nature in all the width and depth

* *Life of Alexander von Humboldt.* Compiled in commemoration of the Centenary of his Birth. By J. Löwenberg, Robert Avé-Lallemant, and Alfred Dove. Edited by Professor Karl Bruhns, Director of the Observatory at Leipzig. Translated from the German by Jane and Caroline Lassell. 2 vols. London: Longmans & Co. 1873.

of her resources which had been the dream of his earliest youth. The slowness of growth which had marked his faculties at the outset of life had proved itself to be no congenital want of mental power, but rather a sign of the depth to which his powers were striking, and the wide hold they were to take of the soil of knowledge. Even what had seemed in childhood to threaten weakness or delicacy of frame had resulted, under judicious treatment and careful habits of his own, in a vigour of body and a power of physical endurance which carried him with scarcely an interval of broken health to the extreme limits of human life. A letter from George Forster to Heyne speaks of Humboldt, then just of age, as having been constantly ailing for the last five years, and suffering from the excessive stimulus to the brain given by the system of the Berlin professors. Kunth likewise expresses the fear that his pupil may succumb to the hardships and privations of travel. Yet from the great traveller himself we learn in later life that he felt proof against all vicissitudes of climate or fatigue by sea or land, and was equally in his element under the tropics and within the polar circle.

In contemplating Humboldt as a traveller, the writer of this portion of his Biography, Herr Julius Löwenberg, dwells with justice upon the comprehensive view of nature which furnished in him the motive of travel. He was the originator of a new epoch in scientific exploration. As early as 1796 he is found writing to Pictet that he had been drawing up a scheme for a universal science. A master of well nigh all the scientific knowledge of his time, he went forth to the study and contemplation of nature with a mind prepared, not only for the perception and appreciation of phenomena, but for the adjustment of new facts to their place in the general order of physics, and their relation to the primary laws of nature. The course of Humboldt's voyages and travels of exploration, with their gains to physical geography and scientific knowledge at large, enters so intimately into his own voluminous writings as to call for less minute or exhaustive notice at the hands of his biographer. There is, however, an abundance of new and interesting matter in his letters and journals, now for the first time brought to light, which illustrates in the most vivid manner the character of the observer and the many-sidedness of his intellect. No sooner is he fairly embarked on his voyage across the Atlantic than we find him already, in June 1799, noting down his researches upon the currents, temperature, and phosphorescence of the ocean, working hard at astronomical observations, dredging off the Canaries to a depth of fifty fathoms, diving into the crater of the Peak of Teneriffe till the sulphurous vapour burnt holes in his clothes, while his hands were numb at a temperature of 36°, the ground under his feet being at times 190°. Plants, animals, insects, rocks, offer new varieties every moment, while the new races of men awaken with still more lively interest his ethnological tastes. One of his earliest inquiries when first treading upon tropical soil is the problem why the refraction of light should be less in that zone of high temperature than at home. The splendid instruments which he had obtained from Ramsden and Troughton are kept in full work, though his face is so burnt in making observations that he has to keep his bed two whole days at a time, and his eyes are nearly blinded by the sun's glare. Through swamps and jungles which proved almost fatal to the indefatigable Bonpland, he made good his survey of the entire system of the Orinoco, extending over twenty thousand square miles, his health and spirits, as he boasts, having been decidedly improved since he left Europe.

The range of climates as well of terrestrial space which Humboldt had marked out for his steps was indeed vastly greater than he was destined to accomplish. There was hardly a spot of the globe's surface that he had not mapped down in his programme of travel. The scheme of circumnavigation drawn up by the French Directory, under the command of Baudin, opened to him at one time the most auspicious prospect of realizing his visions of this kind. He writes in 1799 of having been introduced to the commander, and sketched out in common with him the route for five years to come. The first year was to be spent in Paraguay and Patagonia, the second in Peru, Chili, Mexico, and California, the third in navigating the Southern Ocean, the fourth in Madagascar, and the fifth on the coast of Africa. Paltry considerations of economy, to his intense grief, shattered these hopes, and left him to his own independent energies and the resources of his private fortune. The Mexican tour he succeeded in carrying out, finding his way back to Europe through the United States, where he received the utmost attention and assistance from the leading men both in public and private life. How much had been effected for geographical science alone by this comparatively small part of the traveller's enterprise may be inferred from the fact that the harbour of Acapulco, the position of which he was the first to lay down with correctness upon the chart, had been placed upon Arrowsmith's latest maps half a degree out in longitude and seven minutes in latitude, having been by earlier geographers put as much as four degrees too much to the west. His explorations in Mexico poured a flood of new light upon the mysterious archives and legendary history of that little known country, its monumental remains and strange successions of race, as well as the geological structure and natural resources of the land. He was the first to draw, while at Peru, attention to the valuable properties of guano, and to introduce specimens into Europe with chemical discussions of its nature and use. Of plants and seeds thousands of novel species were sent or brought home by Humboldt and his companion in travel, though terribly injured, to his intense regret, by the damp climate and imperfect packing. The reduction of his multitudinous observations, the sorting and classifying of his innumerable specimens, and the preparation for the press of his notes and recollections of travel, occupied him for many years in Paris, aided as he was by the ablest and most eminent men of science in every department. At the École Polytechnique he shared the room and worked in the laboratory of Gay-Lussac, and Berthollet reported with eulogy upon his atmospherical investigations. His first idea had been to settle at Geneva, where, though the veteran De Saussure had passed away, there were the brothers De Luc, the physicist M.-A. Pictet, Prévost, and Trembley, and the botanist Senebier, who was shortly after succeeded by Decandolle. To Pictet, summoned from Geneva, was entrusted the English translation of certain parts of the work, to consist of four thousand copies, many destined for America, the entire scheme of which extended to eleven volumes, to appear at the same time in French and German. The profits were to be shared between Humboldt, Bonpland, and Pictet. In the meanwhile Humboldt found time for reading papers by the score before the Academy, as well as for original experiments and observations, chemical and magnetic, and for scientific tours to Italy and parts of Germany. At Berlin he had a flattering reception from the King, a grant of 2,500 thalers pension, and, what he could only speak of with irony or contempt, the post of chamberlain. On his return to Paris he brought out in 1806 his *Aspects of Nature*, fragments of which had formed part of lectures before the Academy.

A new phase of Humboldt's life, at which point Herr R. Avé-Lallemant takes up the tale, is opened by his diplomatic mission in the suite of Prince William of Prussia to the Court of the Tuileries after the disasters ensuing upon Jena. His fortunes, it would appear from facts newly brought to light, had undergone a reverse, which made this mission of substantial importance to Humboldt. A letter addressed, it is thought probable, to Baron von Forell, attached to the suite of King Frederick Augustus of Saxony, dated Paris, November 16, 1809, shows both the brothers placed at this time in a position of serious pecuniary embarrassement. In the sequestration, under the convention of September 1808 with Napoleon, of all property in deposit in the Bank of Berlin, to the amount of seventeen million thalers, the patrimony of the Humboldts was most probably involved. The object of this letter is to obtain through the King an exemption for his own and his brother's capital, consisting of 95,000 Prussian thalers on mortgage in the Grand-Duchy of Warsaw. By a decree of March 14, 1809, His Majesty had indeed exempted a further portion of his capital, amounting to 33,000 thalers, on a mortgage at Bodzewic, in Posen, but the war had prevented him from reaping the advantage of this considerate act, and for three years he had received no interest. Hampered as he thus was, he proceeded with unabated energy in the publication of his works, animated at the same time with the scheme of an important expedition into Asia. The volumes were issued, it must be admitted, at a price and on a scale which grievously limited the demand for them on the part of men of science or the public at large. Nor were the plates, greatly as they enhanced the costliness of the work, at all worthy of the artistic powers even of those days. How indefatigably Humboldt threw himself into the undertaking may be judged from the fact that the work on America alone so far extended beyond the original plan as to fill twenty-nine volumes in folio and quarto, illustrated by 1,425 maps and plates, many of which are coloured. The price of a bound copy of the whole series is set down in his note-book at 2,753 thalers. In the sections on Zoology and Comparative Anatomy he had the invaluable assistance of Cuvier, in that on Insects of Latreille, and in that on Fishes and Shells of Valenciennes. The astronomical and other observations were reduced by Oltmanns. A German edition of this section was dedicated to Baron Zach and to Gauss, to whose genius and services to science Humboldt had been the first to accord public recognition. The details of his life and labours during his residence in Paris, notices of the eminent men with whom he associated in science and in public life, and the literary efforts which filled up the intervals in the prosecution of his greater works, fill a large and interesting section of Humboldt's biography at this time. His hours of toil, hardly broken from eight in the morning to a couple of hours after midnight, save by hurried meals and a round of visits, his traits of character and temper, his encouragement of youthful merit, and his snatches of archæology and art, form the subject of pleasant letters from Karl Vogt, Quetelet, Liebig, and other friends. A new expedition, to which he was invited in the year 1812 by the Emperor Alexander, extending from Siberia through Kashgar and Yarkand to the high lands of Thibet, was frustrated by the campaign of Napoleon against Russia. On the entry of the Allied Sovereigns into Paris Humboldt's extensive acquaintance with the capital and its leading men led to his being called upon to act as cicerone to King Frederick William III., in whose train he further proceeded to England, combining with his courtly duties the collection of materials for a work on the political condition of the South American colonies, which he had been requested to undertake by the Allied Powers. So indispensable had he gradually become to his sovereign that, after many overtures and with no little reluctance, Humboldt consented to take up his residence permanently at Berlin in May 1827.

From this point the story of his life, in its meridian and decline is taken up by Professor Alfred Dove. The tripartite

division of the biography is a source of no little confusion to the reader, who must find it difficult to keep the dates and other fixed points of the narrative clearly before his mind. Thus each of the three biographers treats us with more or less of detail to Humboldt's Russian adventures and explorations, carrying us east and west at the cost of an utter entanglement of the thread of the story. It is about this date, in fact, that the three portions overlap each other, and it is not till we settle down finally, under Herr Dove's independent treatment, to the closing scenes of the long record that we have a clear and sustained narrative before us. What most characterizes it, in the absence of stirring political episodes or striking discoveries in science, is the change which is to be traced in the intellectual and social life of Berlin during the third of a century marked by Humboldt's residence in that capital. To that gratifying change he is to be regarded as in no slight sense a contributor, in spite of the sneer of Varnhagen that Humboldt was a great man till he came to Berlin; "he then ceased to be anything extraordinary." In Berlin, Rahel used sarcastically to say, "everything loses prestige, and is pulled down to the level of mediocrity, if not degraded to insignificance; were his Holiness himself to come to Berlin, he would soon cease to be Pope, and would become something quite ordinary, perhaps a horse-breaker." On the cover of a portfolio containing botanical notes for *Cosmos* Humboldt himself wrote, when seventy years of age, "Shame on thee, Berlin! I am weary of thee; thou art nothing better than a bear-garden." To have to amuse and pretend to enlighten the utterly dull and priggish King, the victim of perpetual ennui; to strive after kindling in the vapid circles of German society somewhat of the bright flame of social converse and scientific interest which he had left burning in Paris; to raise up a school of physics in the face of Hegel, against whom he protested as having set up a system of natural philosophy without facts or experiments—these were the tasks to which he felt himself called from the outset. His lectures upon the physical structure of the universe were the first effort of any importance to bridge the gulf which then undoubtedly yawned between the study of science and the education of the people, out of date as a charge of this kind might have become when brought forward by Mr. Buckle. In these lectures was contained the first sketch of what became a finished picture of the universe, in *Cosmos*, of which the first volume was published in 1844. Another great impulse to the progress of thought was given by the Association of Science, of which Oken was the original centre and mainspring, but of which Humboldt was elected the first president, delivering the inaugural address September 18, 1828. Of this cosmopolitan gathering he could write thirty years later, when excusing himself from attending the meeting at Carlsruhe, the last which was held during his life, that the Scientific Association of Germany had remained with him as a faintly luminous image of the mythical union of his country. The Revolution of July again brought Humboldt to Paris, partly for the establishment of friendly relations with the new Court and Government, partly in accordance with his private stipulation for so many months' absence at times from his courtly duties at Berlin. His letters and diaries have furnished many particulars of his intimacy with the family of King Louis Philippe, and of his influence among the intellectual and social circles of the French capital. An episode of his life in which his energy and tact are shown in a most amiable and attractive light is that of the expulsion of the seven Professors of Göttingen in consequence of their vehement protest against the abrogation of the Constitution by King Ernest Augustus in 1833. With Frederick William IV., whom he considered the most gifted monarch that had ever sat upon the throne of Prussia, but whose dreamy unpractical temperament made him the most hopelessly inefficient of rulers, Humboldt lived throughout on terms of affectionate intimacy. To him is due, amongst other services to science and letters, in conjunction with Bunsen, the expedition of Lepsius to Egypt, as well as the publication of the works of Frederick the Great, and the establishment of the Meteorological Office of Berlin, under Dieterici in 1848. Unofficial as was his own position, he was able, as countless letters testify, to exert his patronage on behalf of various scientific undertakings, to bring forward men of scientific promise, and to improve the prospects of deserving professors and students. The institution of the Order of Merit, of which he was appointed the first Chancellor, was the means of furthering his aims in this direction to no inconsiderable extent, albeit entailing many angry reflections on the part of disappointed candidates. Enthroned by the common consent of his countrymen as the king of science, Humboldt exercised to the last a sway over the intellectual progress of Germany more conspicuous for its width and variety than for any special brilliancy or originality in its aims. It was not so much by discoveries of a profound and seminal kind, as by energies skilfully and persistently applied, that he made good his place in the foremost ranks of knowledge. With physical and mental powers scarcely seen to be in the wane till he sank peacefully to rest on the 6th of May 1859, the Nestor of science continued to be sought by a train of admirers to which the New World contributed in rivalry with the Old. It may be that posterity may fail to endorse to the full the estimate of his intellect or of his life's work which is embodied in the enthusiastic tribute of his biographers; yet is there a force to which none can be insensible in the verdict of one like Jacob Grimm, when speaking of the proper juxtaposition of the statues of Germany's greatest worthies—"Near Goethe no one should stand unless it were Humboldt."

"HE COMETH NOT," SHE SAID.*

IT seems to have been determined by some novel writers that, whether or not there is anything in a name, there must be a good deal of it. If their example is generally followed, the days of such unassuming titles as *Emma*, *Northanger Abbey*, *Marriage*, or *Inheritance*, will soon have passed away, and authoresses will no longer dare to send forth a book to the world with no more catching names than *Old Kensington* or *Middlemarch*. The truth is that there is much in a name when it comes from within. There is nothing in the technical name given to flower or shell by men of science; the poet finds that "their beauty is still the same," whatever the clumsiness of their titles; nor will any one, after reading the first chapter of *Kenelm Chillingly*, judge even of a man's character from the name, however ill chosen, which his godfathers and godmothers have bestowed on him. But with the novel it is different; its title is a forecast of its spirit; and where we find a biblical phrase, a violent invocation, or a quotation from a popular poet, put forward to catch the eye, there we expect to find also some conscious lack of power or some touch of vulgarity. The superiority of such a writer as George Eliot stands out in high relief even in this trivial detail. Calm in the consciousness of strength, she can despise these tricks of nomenclature. However, in accordance with that balance of good and evil which some philosophers have discerned to reign throughout nature, we find, as soon as we have turned the first page of Mrs. Cudlip's last novel, that it is an improvement on those which preceded it. Would she but take yet a little more pains she might rank high; indeed the advance in her position as a novelist would, we think, be quite out of proportion to the care necessary to attain it. In the book before us she has given us some excellent things; a plot exciting without sensation, not commonplace, although within the bounds of possibility; and a set of characters most of whom are like real people, with whose thoughts and passions we learn to sympathize, and whose words and actions could not be transferred all round from one to the other like the plates and cups in the mad tea-party without a shock to one's sense of consistency. She has got rid, too, of much of that restless, hasty spirit of work which, backed by what is called, and not ill called, a fatal facility, went to make her former books so disappointing from their crudeness and want of finish. In the story before us this restlessness appears in the general method and construction of the book more than in the working out of individual character.

The outline of the plot is simple enough. We start with the arrival at Moorbridge, Madge Roden's home, of Philip Fletcher, the bad young man, sailing under the colours of another Philip Fletcher, his cousin, who is of course the good young man of the book. His object in coming is to woo and win Miss Roden, while he is desperately loved by her friend Miss Aveland, and really loves her in return, but prefers Miss Roden's acres to Miss Aveland's heart. Hence of course results embarrassment and confusion to all concerned, including at times the reader, who gets puzzled between the two Philips. These embarrassments are not ill arranged; the main fault is that the scenes are too often and too rapidly shifted; when we have got one set of nerves full strung over the vicissitudes of Madge Roden and one Philip Fletcher, we are suddenly whisked off to string up another set for Olive Aveland and the other Philip Fletcher. However, the interest is well sustained in these four, and in the varying fortunes of those three of them who command, or are supposed to command, our sympathy. We say supposed, for we must confess that we have but little fellow-feeling with Olive, and that we regard her as the failure, though we fancy she is meant to be the success, of the book. She is introduced to us as a handsome high-bred girl of a vehement nature, who has been schooled by "a wealth of sorrow and disappointment;" she has been accustomed to conceal her feelings, amongst them her love for Philip, for a long time; she is supposed to be very much a lady, yet the moment Philip appears, not only does she confess to him the love he has already thrown away, not only does she continue all through to lavish it on him with a misguided fidelity, but she bursts out with half confessions of it on all sorts of occasions, and to all sorts of people. She has, too, a disagreeable trick of "whimpering out" things which is tiresome. Altogether the Olive Aveland of the book is not like the Olive Aveland of the opening chapters, and is, to our mind, a very disagreeable young woman. The impression she leaves upon us is, that either Mrs. Cudlip did not choose to be at the trouble of carrying out her original idea of the character, or that her notions of it changed after she had begun, and she thought it not worth while to begin afresh in consequence of the change.

Having failed where we should expect her to succeed, Mrs. Cudlip has succeeded where we should expect her to fail, in the character of the Philip Fletcher who, starting under false colours, keeps up deceptions and plays the scoundrel in one form or another to the end. She has drawn a really good picture of this man, whose nature is not bad, who has no love of scoundrelism for its own sake, but whose whole character is so corroded with selfishness that, out of mere vanity and distaste for labour, he glides easily and hopelessly on from bad to worse in a career of falsehood and baseness. She has accurately seized the extreme sensitiveness born of self-love which belongs to such a character, the lack of power to distinguish how much of his own words is

* "*He Cometh Not*," *She Said*. A Novel. By Annie Thomas (Mrs. Pender Cudlip), Author of "Denis Donne," &c. 3 vols. London: Chapman & Hall. 1873.

true and how much false owing to a long habit of deception, the idle longing for energy to do the right thing which comes over him at times, and the rare flashes of real truth and honesty which will now and then burst out, and which, scarcely spoken, are turned to some account in the cause of untruth. She has also gauged with some skill the amount of intellect which such a man possesses; witness the scene where he "mistakes Madge's admiration of the Idea he represents to her for love of himself." Mistake either of circumstances or of motives is the ruling power in the novel. The writer gives us many instances of what is often seen in real life—two people deep in converse which may affect their whole lives, each steadily interested in the groove he has chosen for himself, and referring everything to that groove; each thinking he has read the other's thoughts and motives, and each grossly mistaken. This theory of mistake is a little strained in the case of Madge's somewhat obstinate adherence to the blunder which makes her think so ill of the original Philip Fletcher; and we are sure that he could not have heard—interpreting it as he did—her speech to him in the tower at Moorbridge without at once demanding and getting an explanation. But this would have made him and Madge happy at once, and so have left no excuse for the greater part of the third volume. Madge is another success to be scored to the author, who in her has drawn, and drawn well, a fresh, clever, unspoilt girl so natural as to appear to strangers a desperate flirt, thoroughly tender and womanly, and yet possessing what is very rare in women, a man's sense of honour. Her treatment of the false Philip when she first discovers his falseness is the most striking example of her character to be found in the book, and is capitally worked out. One little touch is especially good:—

"Has Olive married?" asks Philip. "Married, no! gone into a show-room as a —," she is checked by a sigh of relief from him.

"Did you know that and keep it from me, Philip?" she asks with quick discernment. Then, as he does not answer, she adds, "I wish you would try to tell me the —," she is on the verge of saying "the truth," but substitutes the words "all about it" instead.

We get really interested in Madge, and are a little vexed that we have seen so little of the admirable Philip Fletcher, and are therefore obliged to take so much of his good qualities on trust, when he marries her at the end, to the relief of the reader and in the interest of poetic justice. We were inclined at first to think this was not satisfied in the case of the other Philip Fletcher; but on further reflection we can wish him no worse fate than to pass his days in the society of the terribly juvenile Lady Tollington. Poor Olive, who comes in for more than a fair share of misery throughout, is perhaps a little better off at the end; for, having made mistakes all through her life on the subject of her darling Philip, she makes her last mistake as she drowns in thinking that he has come to save her. On the whole, the conclusion is satisfactory, and the book is far more so than Mrs. Cudlip's last; but she has many faults and vulgarisms of style which require correction. When, snatching some breathless moments behind a lifted school-desk, we were accustomed to thrill with delighted horror over the perils of the Scalp Hunters or the Boy Slaves, we learnt to look on a line or two of asterisks as a fit and proper method of at once spurring our interest and saving it from too continued a strain, just as a Spaniard smokes his cigarette between the courses of dinner, and finds in it both a stimulant and a relief; but the employment of this device in a novel of everyday life to denote a short lapse of time, or a slight disconnexion of events, is a mean expedient, betokening either laziness or incapacity. Mrs. Cudlip's style is remarkable for a flashiness which is clearly meant to be pointed and impressive, but is only wearisome. One phrase which we have already quoted, and to which she seems attached, is "a wealth of sorrow and disappointment." After "wealth of golden hair" has been worked to death, it is a little hard to have this flung in our faces. The author may quote in defence Gretchen's "du Schmerzenreiche," but because an expression is once used with fine effect by Goethe, it is not therefore fit for common employment in a novel. No one wishes to take Sèvres plates to a picnic. Besides, wealth of disappointment, that is, affluence of deficiency, is a contradiction. Then we have a fashionable square described as "auriferous"; a girl's voice is "as soft and rich as buttermilk"; a young man talks to himself of a party of ladies as "these colts" and a well-brought up young woman longs "to snuggle her head down" on a man's shoulder. At critical moments people's hearts always "thump," or their voices are "choked by a great dry sob." Such tricks as these are common, and belong to a common class of novels. If Mrs. Cudlip would show any real feeling for her art, let her avoid them.

STATION AMUSEMENTS IN NEW ZEALAND.*

THIS pleasant little book has suggested to us a problem which we do not feel quite equal to solving. Many philosophers have assured us that the first of all human blessings is health. Any one who is in thoroughly first-rate condition is pretty nearly independent of all other means of enjoyment. He may be deprived of books, may lose his friends, and may even be up to the ears in debt; but so long as his digestion is in good order, and his lungs are working properly, he has no right to be unhappy. The theory is a plausible one; and Lady Barker's writing appears—though she does not say so—as if it were expressly intended to confirm it. If we could be perfectly satisfied that the tone of extreme enjoyment in which she describes what she is pleased to call the "amusements" of New Zealand is a genuine reflection of her past feelings, and not partly a result of the pleasant hallucination of memory, we should regard her as a strong witness in favour of the doctrine we have mentioned. Her evidence is all the stronger because it is more or less unconsciously delivered. She mentions indeed the healthiness of open-air life in New Zealand as one of the great recommendations of the country; but she scarcely seems to recognize how essential a condition it must have been for making the scenes described agreeable or even tolerable. We must therefore take the liberty of restating the argument in our own fashion, using the materials with which Lady Barker has provided us.

She writes her book, she tells us, "in the heavy atmosphere of this vast London world," and looks back with a "desperate craving" to the delicious air of the New Zealand valleys. We have read her book in the same atmosphere; and though our cravings can hardly be described as desperate, and do not point to New Zealand in particular, we admit that we reflect with some pleasure upon air which has not passed through so many lungs as that which we habitually consume. So far, then, New Zealand has an unmistakable advantage over London. But when we endeavour to realize the price which we should have to pay for unadulterated air, we confess to feeling pretty nearly reconciled to our comfortable, though rather grimy, metropolis. Let us briefly run over the list of "amusements" provided for us at the antipodes, and consider how much they would do to replace those from which a London emigrant must be parted. We begin by a brief description of the pleasures of a picnic in the bush. A picnic, as a rule, is intolerable; it may however be supported with stoical composure when you are sufficiently near to civilization to enjoy some of its advantages, and to feel the absence of burdensome comforts as a relief. It is pleasant to boil your own kettle when there is a good inn within reach, and any little deficiencies may be made up at the price of half-an-hour's waiting. But when your whole life becomes a picnic, we should say that the amusement would pall upon one. Lady Barker enjoys the memory of looking at a pretty view on a fine day in the bush; but we must ascribe some indeterminate part of the enjoyment to the fact that the memory is contrasted by everyday life in London. The male Englishman, at any rate, would get tired of a prolonged indulgence in amusement of this very calm and contemplative order. Probably his first demand would be for something to kill. Now, with the exception of the Maoris, who are fast disappearing, and who had a bad habit of killing in return, there is next to nothing to satisfy the murderous tendencies of the genuine Briton. According to Lady Barker's account, the only accessible game consists of eels and pigs. Eel-fishing in New Zealand, if we may trust her experience, is an amusement dreary enough to damp the spirits of an Isaak Walton. You walk out in the middle of the night through a country overgrown with "Spaniards." A Spaniard is an uncouth vegetable some two feet in height, from four to six in circumference, set all over with spikes which are something between a needle and a bayonet. Interspersed with the Spaniards are clumps of "wild Irishmen," the appropriate name given to a bramble with a magnificent apparatus of thorns, calculated to destroy the strongest garments. Struggling through this charming country, you reach a deep glacier stream with treacherous banks. You set your lines, and after waiting some hours you may succeed, if you are lucky, in hooking a certain number of eels, and probably fall into the river in the effort to drag them out. You have to maintain absolute silence, and may therefore, if you please, follow Lady Barker's example by indulging in pious speculations upon your position in the universe. That, however, can be done without going to New Zealand to catch eels. You stumble home towards morning with a sackful of slimy creatures, which, if unskilfully cooked, make you vow never to touch eels again; and it need hardly be said that cooking is an art very unfamiliar to the British colonist. The next week will probably be spent in performing surgical operations upon your person with a view to the extraction of thorns; but you have the negative advantage that in that healthy country you run little risk of catching colds and fevers. We do not wonder that even Lady Barker's enthusiasm fails her a little in describing this sport, and that she admits that even on the first occasion it was only delightful in anticipation. To any one who has read her book even that pleasure will have disappeared. Lady Barker, however, declares that she "found great pleasure in going after wild pigs." That pig-hunting requires as much skill as deer-stalking we are quite ready to believe, and it has the advantage of being a more utilitarian form of sport; inasmuch as wild pigs are a nuisance to the sheep-farmer. We feel, therefore, compelled to admit pig-shooting as a decidedly favourable item in the account of New Zealand existence. Still "*toujours* pig" must become tiresome after a time, and this is but a meagre bill of fare to set before the hungry sportsman. The next "amusement" on Lady Barker's list is skating, but as the amusement could only be enjoyed by her at the expense of a long day's ride over a very difficult country, through swamps and wild mountain gulleys, up to a retired lake high in the mountains, and a sojourn at a rough log-hut, we are not altogether surprised that even here the party "tried hard to be gay," and, as it would seem, with very indifferent success. On another occasion, in a very hard winter, Lady Barker was able to indulge in the amusement called "toboggon-ing"—that is to say, sliding on a sledge

---

* *Station Amusements in New Zealand.* By Lady Barker. London: Hunt and Co. 1873.

down a steep snow slope. The pleasure was rather damped by the reflection that the snow which provided this amusement had caused the loss of some thousands of sheep. As it was impossible to look for them till the snow had melted, when the whole air of the neighbourhood was tainted by the odour of decaying mutton, it was creditable to their proprietors that they relieved their anxiety by practising "glissades;" but there must have been some drawbacks to the pleasure.

The next amusement described by Lady Barker is called "buying a run." Sport of this kind has the advantage of being somewhat onesided. A gentleman just on the point of starting for England calls to offer you a magnificent tract of country, full of splendid timber and admirably adapted for sheep-farming, at a ridiculously low figure. If you hesitate for a moment, he assures you that half-a-dozen other gentlemen are waiting with blank cheques ready to take advantage of your delay. You accordingly jump at the offer, take leave of your friend, who parts from you on the mail steamer regretting that he has given you so easy a bargain, and then travel some hundreds of miles to your new purchase. It turns out to be all that he said, except that the difficulties of transport are so great that the timber is for the present valueless, and that certain barren mountain ranges, which he had forgotten to mention, cover the ground where there ought to have been pasture for sheep. On the other hand, the few inhabitants are very glad to see you, having had no news from the outside world for a year or two. Lady Barker amused herself on the trip she describes by giving to the only woman in the place an abridgment of the history of England, beginning from her earliest recollections. When she got home again, after a very long and tiresome journey, she was so much delighted as nearly to forget the trouble and the disappointment; but she can hardly describe this with much accuracy as a New Zealand amusement.

The next amusement consisted in hunting up a congregation for a Church of England service by riding after various shepherds, who often lived at distances of five-and-twenty and thirty miles, and were pretty certain to be out on the hills when she reached their huts. The country was beautiful, and she was "never weary of gazing" at purple cloud-shadows and blue skies. And yet, she admits, "when she comes to think of it," she had not much time for looking at the scenery, as her mind was occupied with the troubles of settling down in a rough house with a body of undisciplined servants. However, the rides after shepherds were very pleasant when the weather was fine and when she did not get into a swamp, or have to scramble over a dangerous cliff or a treacherous wire fence. At last she collected a congregation of shepherds, and even induced them, by an unprecedented exercise of skill, to take off their hats when she came into her kitchen. The domestic amusements were of course unceasing. Her servants would marry the aforesaid shepherds; the cooks were raw Irish girls, with elementary notions of converting any food into an article fit for human consumption; and the one good cook whom she engaged, and who luckily had a beard, which tended to repel suitors, was found a few days after her arrival breaking up a pile of plates under the impression (produced, as it is needless to add, by rum) that it was a lump of coal. We need not speak at length of other amusements, such as attending a labourer who had nearly killed himself by eating poisonous funguses, or driving to a picnic in a heavy dray with a horse which considered it proper to jump deep streams, and thereby reduced the dray to its primitive elements, or various other amusements incident to a rough and ready life.

Reading Lady Barker's words in cold blood, and doing our best to divest them of the colouring which she has unconsciously bestowed, we confess that we feel reconciled to our position in England. Yet it is creditable to Lady Barker's literary skill that we are often carried away by her contagious enthusiasm; and we are forced to believe that a lady who can describe with so much freshness must really have found something enjoyable even in the hardships of the life. The record probably gives undue prominence to the pleasanter sides of her memories; but there must have been a really pleasant side to the facts on which they are founded. Though we do not feel our relish for more civilized pleasures destroyed, we admit that for the large class of people to whom a good appetite with abundant means for its satisfaction is the *summum bonum*, New Zealand may be a very agreeable place, and Lady Barker's example proves also that more refined persons may extract many genuine pleasures from rather unpromising materials.

PANDURANG HARI.*

IN the introduction to *Ivanhoe*, published many years after its first appearance, Scott insists that the title of a novel should convey no indication of the nature of the story, and he proceeds to say that what is called a taking title may serve the interest of the bookseller or publisher, and yet may be fatal to the literary reputation of the author. Readers who form their own ideas of a story from names or titles are apt to be disappointed when the author takes an unexpected turn, visit the unlucky writer with their displeasure, and end by exclaiming that they could have executed the design much better themselves. The book which we are now reviewing, on the whole, complies with the canon laid down by Scott. *Pandurang Hari*, even to Anglo-Indians, conveys no very definite idea, and "the Memoirs of a Hindoo" might be the autobiography of a converted Brahmin, or of a deposed Raja, or of an unsuccessful candidate for the Civil Service. Some explanation of the circumstances of publication, and of the patronage under which it is given for a second time to the world, is indispensable to any comprehension of the plot and the purpose of the writer. Some fifty years ago a gentleman named Hockley, a member of the Bombay Civil Service, published the story of *Pandurang Hari*, under the allegation that it had been translated from a memoir given him by a native friend, written in the Mahratta dialect. This thin disguise most probably no more deceived readers than did Scott's introduction of Sir Arthur Wardour, his oaken cabinet, and his Anglo-Saxon manuscript prevent the public from seeing the author of *Waverley* and of *The Antiquary* in *Ivanhoe*. *Pandurang Hari* lifted the veil which had covered native society, was circulated, quoted, and read. After the lapse of half a century it has been exhumed by Captain Meadows Taylor from the library of an Irish nobleman, and reprinted—we wish we could say re-edited—by Sir Bartle Frere. But, while the work has been rescued from oblivion, the author himself has disappeared beyond the reach of criticism. Sir Bartle Frere can only tell us that he served in a judicial situation at Broach, and under the Commissioners of the Deccan, and that he left the service under a cloud. It is most probable that he belonged to that limited class of public servants who by some peculiar mode of life—*vitiis imitabile*—contrive to win the confidence of Asiatics, and to discern things veiled from the official eye. It is clear that he had no claim to be considered a learned or even a correct Orientalist, but he had somehow broken down the partition of native reserve, and had witnessed the oddest sights and scenes. According to the editor, his memory survived as a practical joker; and he must certainly have been gifted with a power of minute observation and a considerable insight into character.

To understand the work presupposes an ordinary acquaintance with the slight framework of history in which it is set. The author took for his subject Western India at the beginning of this century, when the great Mahratta chieftains were quarrelling amongst themselves about the division of the effete Mogul Empire, and when they had successively to succumb to the genius of the Wellesleys and the policy of Lord Hastings. It is true that the principal native actors in those events hardly appear in the novel at all. There is a mention of Holkar's camp and of the crooked policy of the Peshwa; and there are brief descriptions of the battles of Assaye, Argaum, and Kirkee. But the interest mainly centres in low life; and the chief figures are Pindarrie freebooters, devotees whose morality is on a par with the ashes and cow-dung that besmear their bodies, rascally police agents, cunning spies, and repulsive old hags. Occasionally a more notable figure not only appears on the canvas, but is painted at full length, and we hear a good deal about a certain Trimbuckji Danglia and his politics. Now this worthy was the Minister of the famous Peshwa Bajee Rao, the adoptive father of Nana Sahib of Cawnpore, and he has come down in history as the instigator of the murder of Gungadhur Shastri, Minister of a rival potentate, the Gaikwar of Baroda. Readers of Bishop Heber's journal may recollect his description of the deposed Minister shut up in the fort of Chunar, which has, before and since, been the residence of many a political prisoner whose crimes had merited a shorter shrift or a narrower cell. The same excellent writer, on his visit to Bombay, learnt the particulars of the escape of Trimbuckji from his previous confinement at Tanna, some thirty miles from the capital of the Western Presidency. And they are so characteristic of the scenes reproduced in *Pandurang Hari* that we may briefly recall the tale as it is told by the Bishop. Shortly after Trimbuckji was confined at Tanna, a Mahratta groom, bearing, as native place-hunters almost always do, an excellent certificate in writing, came to the English officer in charge of the captive, and was received into his service. This *syce* or groom rubbed down his horse under the windows of the prisoner, and sang snatches of native ballads in the Mahratta dialect, generally just at the time when the ex-Minister was allowed to take his afternoon exercise. On the day when the prisoner contrived to get from the outhouse of the fort to a hole cut in the stable, and so to escape, the groom disappeared with him. It was then remembered, doubtless by natives who had an inkling of the plot, that the ballads bore some relation to the circumstances of the parties, and the author of "Palestine" has left in his journal the following spirited translation of the songs:—

Behind the bush the bowmen hide,
The horse beneath the tree;
Where will I find a knight will ride
The jungle path with me?
There are five-and-fifty coursers there
And four-and-fifty men,
When the fifty-fifth shall mount his steed
The Deccan thrives again.

The Bishop says that this might have been a "stratagem of the Scottish Border," and we need only refer our readers, for a sort of parallel, to the song put into the mouth of Blanche of Devan which awakened the suspicions of Fitzjames, and to the warning conveyed by Madge Wildfire in a jingling ballad to Geordie Robertson when he met Jeanie Deans at Muschat's Cairn.

To analyse the plot and to follow the adventures of Pandurang in the space allotted to us would be impossible. But the outline of

* *Pandurang Hari; or, Memoirs of a Hindoo.* With an Introductory Preface, by Sir H. Bartle Frere, G.C.S.I., K.C.B., D.C.L. 2 vols.

the story is as follows:—The hero—if such a term can be applied to one who is worse than Marmion, "quite a felon," and very little of a knight—is in reality the son of the legitimate claimant to the principality of Sattara. His real name was Jeoba. In youth he was kidnapped by a wicked uncle, Gunput Rao, who figures in the narrative as Gabbagi Ghousla. Gunput had several objects to accomplish in life. He wanted to marry his own son, Mahadeo, to Sagoona, the daughter of a Brahmin, who was betrothed to Pandurang; and he wished to be made Raja. With this view he tries to murder his brother, and kidnaps the child. The brother escapes, and, disguised as a goatherd, lives for some years in a wild and inaccessible glen. Pandurang falls as a child into the hands of Sawant Rao, a chief of some note in the service of Holkar. His patron dies from wounds received in a battle between Scindia and Holkar, bequeathing to Pandurang a silver chain which is to serve as a clue to his parentage and birth. Deprived of a protector and thrown on his own resources, the rightful heir to a Mahratta principality goes through a variety of queer adventures, and is put to all sorts of shifts for a livelihood. But, wherever he goes, the relentless and vindictive uncle turns up, generally as a Gosain or sacred mendicant, to thwart his nephew and to get rid of him. Pandurang is by turns a servant to a shopkeeper, a *peon* or orderly, a groom to an English officer, a pretended magician, a hireling to two ruffianly adventurers, a delegate to a native Court in the disguise of a Bheel, and a clerk, and eventually a pleader, before an English judge in a populous city. During all these metamorphoses the Gosain or wicked relative is always instigating others to carry out his revenge. And the unlucky Pandurang is wounded, hunted from place to place, captured by Bheels, robbed by Thugs, and nearly killed by jungle-fever. Sagoona, his betrothed, is exposed to similar perils. At length the vagrant son is reunited to his banished father; the minor villains of the narrative are suitably disposed of; the troops of Gabbagi or Gunput are worsted in battle by the adherents of the rightful sovereign; and when the villain has made a full confession, and the English Resident has appeared on the scene, all ends happily by the accession of the old goatherd and by the union of Sagoona and Pandurang. Gunput, we should say, though as mean a rascal as the pen of fiction ever drew, is not hanged or blown from a gun, but is only imprisoned for life.

Such is the outline of a tale which, though not wanting in merit, and certainly neither dull nor commonplace, will never take rank as a first-class Oriental story in which an accumulation of new material is so skilfully disposed as to attract and arrest the attention. The editor remarks truly that the hero cannot be termed interesting, and the humour, such as it is, is coarse, and has none of that delicate flavour which takes off their grossness from vice and criminality, and charms us in *Gil Blas*, the *Arabian Nights*, and *Hajee Baba*. At the same time some of the incidental sketches and episodes are striking, and in the hands of a real artist might have lifted the work to a higher level than just criticism will ever assign to it. The adventures of three Pindaries are well told. There is a scene in which Pandurang locks up his enemies in a lonely cave somewhat after the fashion by which Arbaces, in *The Last Days of Pompeii*, confines the sole witness of the murder. Then the descriptions of Oriental camps, armed assemblages, police courts, and of the funeral of an old Hindoo, one of the few respectable characters in the memoir, are generally accurate in detail and decidedly curious in character. We could have wished that Sir B. Frere, than whom no one is more capable, had added a few notes in explanation of obscure passages and allusions, and in emendation of obvious errors. Why an editor who lends his name to a reprint of an obsolete work, and graces it with a well-written preface, should say that "it is useless to attempt" to correct wrong names, or how he satisfies himself that "correct translations of modes of address" "would have involved alterations in style not justifiable in a reprint," we cannot imagine. There are surely such things as foot-notes for all new editions, and a heading to the chapters would not have involved more labour than an unlearned public has a right to expect.

The real justification of this book is, however, very well pleaded by Sir B. Frere in his preface. No man has taken a deeper interest in the people over whom he was formerly placed; none has been more earnest to welcome signs of national and social advancement, or more keen to detect the presence of good qualities in the midst of deep moral debasement. Yet, we have his word for it that the descriptions are "remarkably faithful sketches" of the time; "substantially correct," "generally truthful," and so forth. Now the story, in plain language, describes a set of men, who, from the highest to the lowest, swindle, cheat, oppress, rob, plunder and assassinate, with little or no compunction, to serve their own ends. Englishmen who delight in running counter to the generally received estimates of the national character, and voluble young natives who wear polished leather boots, drink pale ale, and quote Shakspeare glibly, may very likely protest against the narrative, and declare that such a state of society could never have existed only "sixty years ago." But those who have had the opportunity of gauging native character when exposed to corrupting influences without safeguards, and of ransacking the materials out of which Oriental history must be written, will testify to the truth and justice of Sir Bartle Frere's remarks. Pandurang lived and moved amongst human beings who, in the general scramble for the good things of this world which marked the dissolution of the Mogul Empire, broke loose from the slight restraints which religion or power in the hands of one or two vigorous rulers had imposed on them. We came, found Malebolge, and we have cleaned it out. If we have done nothing else for India, we have made such a state of things as is described by Pandurang Hari simply impossible. And that a liberal-minded ex-Governor, with a large experience of native character, and yet tolerant to a fault, should deliberately record his opinion of the substantial accuracy of such a hideous picture of morals and manners, ought, in the eyes of a statesman and a philosopher, to be one good reason why we were placed in India, and why we should remain there for a very long time to come.

OLD GERMAN LIFE*

VERY inconsistent and even contradictory views have been presented in modern times of the modes of life and the manners of the ancient Germans—the Germans, that is to say, before they were Christianized. It has been common with some in the pride of modern culture to paint them as the merest savages and barbarians, living without houses or herds or the tillage of the soil, roaming the primeval forests in all the glory of rude freedom, and showing no trace of civilization. A different, though equally erroneous, view represented these same Germans in the light of poetry and romance, as endowed with a tenderness of feeling and a chivalrous devotion to the weaker sex that have hardly been paralleled in the world since. The origin of the latter and more prevalent view is not difficult to trace. Of course it is agreeable to the modern Teuton that his ancestors should be described as a race of sensitive Troubadours rather than as a tribe of wild Indians, and modern sentimentalists found pleasant employment in enlarging upon the ideal virtues of their forefathers. It is more specifically to Tacitus, however, that we must trace the roots of this fancy picture of old German life. His *Germania* paints a race gifted with the noble virtues that were most at a discount in the corrupt Imperial society in Rome with which he was familiar. To the moral decadence of the mistress of the world at the height of her power and glory Tacitus opposed the idealized portraiture of a world of simple primitive manners before luxury had corrupted or vice enslaved. The tendency shared by so many other writers to find a golden age at the origin of human life and society was no doubt strong also in Tacitus. He speaks in his *Annals* of the early race that was not at all subject to rude passions, but lived pure, innocent, and free, practising instinctively all the virtues, until equality was overthrown by monarchy, and force and ambition ruled supreme. Like Rousseau, Tacitus saw in the life of nature, as opposed to civilization, the veritable age of gold. He strove to console himself for the evils of the present by creating his ideal in the remote in space or the past in time, at one moment placing it at the origin of society, and at another, so that it might be nearer and more palpable, on the outskirts of the Roman Empire, among the barbarians whom Rome had begun to fear. The fact that he thus idealized in his *Germania* seems plain from the circumstance that we find in the treatise many of the chief features by which various writers had described the Scythians, Thracians, and other barbarians, as if borrowed directly from them. No doubt the *Germania* contains accurate information regarding the Germans. Such information as Tacitus was able to pick up concerning them towards the close of the first century has been interwoven with other and more fanciful descriptions, giving as the result the representation of a generous ideal that might serve at once to strike shame into the degenerate Romans for their vices and luxuries and incite them to a nobler activity and the pursuit of higher ends. What primitive Sparta was to Greece, and particularly to Athens; what the Rome of Romulus and Numa was to the later Romans; what the virtues of the Hyperboreans and the wisdom of the Scythians were to classical antiquity, Tacitus sought to make Germany and the Germans to the Romans under Domitian. Much that he has told us is undoubtedly true, and is invaluable for the light it throws on a period of almost utter darkness. But the *Germania* is nevertheless an idealized representation of the ancient Germans. As Montesquieu, in his *Spirit of Laws*, has painted the English Constitution in its fairest colours; as Madame de Staël, in her book on Germany, gave a romance under the form of sober description; or as De Tocqueville, in his account of American democracy, pictured forth an imagined, rather than the actually existing, democracy, so is it in like manner with Tacitus. Each of these writers, it may be said, has given his *Germania* to the modern world.

The impressions thus produced by the writings of Tacitus regarding the ancient Germans are not easily to be eradicated. We may expect our German friends to cling to the fancy picture till they are compelled to give it up. All the more honour is therefore due to any of their writers who seek to get back to the facts of sober history from the region of romance and imagination, as Wackernagel does in the volume of essays before us. These "Minor Works" are illustrative of various phases of German life and manners at different periods. The first papers in the volume are devoted to ancient Germany, to elucidations of some of its more general characteristics; and several of the subsequent ones deal with special features of German life in the middle ages, while the rest are of a more or less technical nature and interest. Herr Wackernagel, it will thus be seen, does not specially affect popular subjects, and neither can we say that he is a particularly

* *Kleinere Schriften.* Von Wilhelm Wackernagel. Erster Band. Abhandlungen zur Deutschen Alterthumskunde und Kunst-Geschichte. Leipzig: Verlag von S. Hirzel. 1872.

attractive writer. He is more of the antiquarian Dryasdust than of the literary artist. From the multitude and wealth of the details which he offers us, his writings assume an almost encyclopædic character, and we may be tempted to adjudge him a mere collector of minute and out-of-the-way items of forgotten lore. Such an impression, however, will be transitory. The patient reader finds that the details are not presented to him merely for their own sakes, or to display the erudition and research of their collector. They will be seen to arrange themselves in philosophical order as illustrative of certain broad principles or important features. Their merely encyclopædic aspect thus disappears. We are under the guidance of a capable and cultivated leader who, even when most profuse in the multitude of his information, never loses himself in mere details. The style of the book is not indeed to be greatly admired. But the reader who is more intent upon matter than manner, more careful to obtain information of a valuable, because illustrative, character than anxious to criticize the vehicle by which it is conveyed, will forgive the hard and sometimes involved sentences, the wearisome and too numerous references and notes, and the sometimes irritating display of erudition. The contributions to a knowledge of German antiquity will repay the student for his labour.

The first, and in some respects most important, of the papers contained in this volume deals with the "Family Rights and Family Life of the Germans." Wackernagel adopts neither of the two hypotheses of which we have spoken. His German ancestors are neither the wild Indians of modern investigators nor the chivalrous models of Tacitus and the sentimentalists. To him the heathen German stands on much the same stage of moral and civic culture as the Greeks who are described in the Homeric poems. Although it may at first sight seem to be claiming a good deal to ask us to regard the Germans of the first and second centuries as so far advanced, we soon discover that this stage of progress includes very much that is the reverse of noble or attractive either in the savage or the civilized human being. The family of the ancient German was a type and image of the wider life of the State. Hegel has summarized the great stages of the progress of the human race historically under the threefold representation in which, first, only "one" is free, which develops into the second, wherein "some" are free, in order to pass over into, and find its completion in, the third, in which "all" are free. Our earliest glimpses of German society show that it exists in the first of these three stages or phases. In the family only one is free as ruler and master, and all its members are subject to him. The father not only exercised authority over wife, sons, and daughters, but they were his property, his goods and chattels. While the people were divided into priests, nobles, freemen, and slaves, there existed in the narrower circle of domestic life only the distinction of those who were free and those who served, of ruler and subjects; for the father was king and priest, nobleman and freeman all in one, and not merely held the plough, but also wielded the sword both of war and justice, offered sacrifices on behalf of his family, and directed them in all things, while they honoured, obeyed, and served him. This was true only, of course, of the free race. The bondsman was treated as incapable of holding property or of acting according to his own will, and his wife and family belonged equally with himself to his lord. The bride was bought by the bridegroom from her father, to whom the price was paid over, and this was the only legal mode of obtaining a wife. A contract of marriage begun in any other way was regarded as robbery, and might be punished as a crime. A ring was placed on the hand of the wife and shoes on her feet, in token that she was bound by the will of her husband, and that she was his alone. The very grammar of the Germans proves that the woman was thus considered the property of the man, for they speak of *das* Weib, not *die* Weib; and she might be sold over again, or even killed, if by any act of infidelity she appeared to deserve such a fate, without punishment overtaking her lord and master on her account. Of course, when the wife was thus dealt with, the children were also regarded as servants, and it is curious, says Wackernagel, that the word Knecht, or servant, is closely connected with Knabe, a boy, while Dirne, a maid, is derived from dienen, to serve. In the German domestic circle the children of the free and those of the bond mixed together, performed the same services, ate of the same food, and had the same enjoyments and sports. Hardest of all perhaps was the lot of the aged, who were made to feel that they were encumbrances on the earth. It was of course held that none who died on a sick bed would enter Walhalla, the home of the blessed gods and of heroes, and it was not unusual for the old to seek death for themselves when they thought their time had come. It was even the case that the slaughter of the old by their relations was often considered a labour of love. "Do not," says Wackernagel, "let us shudder at the barbarity of our forefathers as if this cruelty were confined to them alone; it was common among many other peoples of Europe and Asia, even among those whose image and representation seems to us still of an ideal character; there was a time even in Rome when sexagenarians were thrown into the Tiber."

In ancient Germany the wants of the household had to be supplied by every master or head of a family, with the help of course of his servants and children. What was required for food and clothing as well as what was needed in the way of implements must all be home-made. Those branches of labour which were thought unworthy of the man fell upon the women and children, the aged persons and slaves. Richer people had slaves trained to special functions, and devoted wholly to these, while the lord took pleasure in furnishing and making ready his own weapons for the chase and for war. At the feasts on solemn or ceremonious occasions it was the place of the wife to serve her lord and his guests, and to hand round the horn from which they drank. Even ladies of the highest rank performed this office, which frequently was no light or easy one, as the guests sat far apart arranged along the hall of festivity, every two or even one at a separate table, and all drank freely and fiercely. That indeed, says Wackernagel, was the old vice of the Germans. There were special occasions, as on great sacrificial feasts, when the whole assembled people consumed the food and drink which every one had brought with him, as also the animals offered in sacrifice. There seems to have been no custom of primogeniture known among the Germans, for all sons inherited in equal portions the property of their fathers. The women were excluded (both the widows and daughters) from sharing the goods of their lords. The custom first began in the middle ages of admitting the eldest son to a larger share, and the widow and daughters to a portion of the possessions of the father. In not a few cases, however, the widow thought herself bound not to outlive her husband. Some of the German tribes held with the Indians that the wife was so much the property of the husband that she ought to die with or immediately after him; and if his body was buried or burned that she was bound also to let herself be interred or burned at the same time.

Such are some of the details contained in the paper on the "Family Life of the Germans." In one short paper the author has gathered together the materials for a picture of the stage of culture, manners, and morality of the German races in their pre-Christian period. The same plan is followed in the other essays of the volume. After that of which we have spoken is an almost equally interesting and instructive one on the trade and navigation of the Germans, from which we are enabled to picture them on another side of their activity — to see them in the numerous expeditions to which Europe owes so much. A third exhibits to us the German in his times of festivity—though at a later period—and we are taught what were the drinks he specially affected. The essays dealing with special characteristics of German life in later times include one on "Chess in the Middle Ages," which gives us a glimpse of the domestic sports of the wealthier and better born; for chess was peculiarly a game of the aristocracy, and much profusion of expenditure was devoted to preparing costly boards and ornamental pieces richly wrought in gold and jewels, and adorned by many artistic devices. A characteristic of the period is the way in which we find the game of chess serving as a source of symbolical language. Its terms entered into the language and poetry of everyday life, thus illustrating the symbolical modes of view current in the middle ages. For in that period what was nearest and commonest must be the medium for suggesting something higher. This same tendency was exemplified in the use in the middle ages of colours and flowers which had a special language of their own; and the Dance of Death became to art, both in painting and architecture, a fruitful source of varied and almost innumerable representations of moral or religious significance. The mingled recklessness and levity of the period was fond of expressing itself in such figures, and of all subjects death came to be one of the most frequent and favourite topics of illustration. On all these points and many more much light is thrown in the papers in Herr Wackernagel's volume. It also contains some valuable papers illustrative of the history of art in the middle ages.

MURPHY'S MASTER.*

THE prolific author of *Lost Sir Massingberd* is once more coming up for judgment. Undeterred by the numerous sentences which it has been our duty to pass upon him on previous occasions, he presents himself with an air of decided levity. In spite of all warnings as to the dangers of melodramatic writing, he indulges himself in *Murphy's Master* with a catastrophe on a scale of hitherto unparalleled magnitude. We will not do him the injustice of supposing that he is perfectly serious; for, to say the truth, he has far too much humour to be awestruck by his own creation. We guess, however, that the readers for whom this story is specially intended will be puzzled to know whether the author invites their laughter or their tears. Some of them perhaps will be deeply impressed by the strange narrative, of which we are about to indicate the salient points; and, if so, we are pretty certain that the narrator will be amused, though perhaps also a little pleased, by the emotions which he has caused. For ourselves, we will confess that we were carried along by the story, partly by sheer curiosity as to the climax which could fittingly cap so singular a series of adventures, and partly, it is just to add, by the skilful management of an experienced storyteller. Regarded as a serious novel, we could not say very much for *Murphy's Master*; but as a specimen of the art of balancing on the verge of the grotesque, it is worth the few minutes employed in reading it.

Imagine then—we shall venture to tell the story in our own way—a young man running away from the brutalities of a cruel stepfather. He is in the wilds of Windsor Forest, and the time of the adventure appears to be within the last few years. Of course a violent storm is raging, as always happens when young

* *Murphy's Master, and other Tales.* By the Author of "Lost Sir Massingberd." London: Tinsley Brothers. 1873.

gentlemen are leaving their homes. Suddenly there appears a dog-cart with two occupants, driven furiously along the road. The young man stops it just in time to prevent its being upset by a fallen tree. Now, by a natural coincidence, the two men in the dog-cart, who are in fact Murphy and his master, are also running away; but with stronger reasons than young Chesney, who has thus saved their lives. Mr. Kavanagh, the master, has just murdered his brother, who was ill advised enough to keep the whole of their father's estate on the ground that Kavanagh was illegitimate. Legally, the brother's position was unassailable, but Kavanagh, being an Irishman, considered that this only made his conduct more unreasonable, and accordingly strangled him in the course of a lively altercation. Murphy, being also an Irishman, and of the conventional type whose one principle is a dog-like loyalty to his master, considers that the murder was justifiable, and even creditable, more especially as Kavanagh was a Fenian, and his brother a loyal British subject. This pleasing pair are in too great a hurry to give a full account of the transaction to young Chesney; but they have just time to hint that they are fugitives from the law when they hear the mounted police approaching at full gallop. Arranging the fallen tree across the road, they wait long enough to see that the policeman comes down and is smashed in the dark; and the three then gallop off to London. On their way Kavanagh has time enough to inform young Chesney that he has just committed a justifiable murder, and is going to escape to a distant land. Chesney naturally begs to be taken into his service, and swears eternal fidelity to his new friend, the more readily as Murphy shows some symptoms of a disposition to choke him by way of precaution against treachery.

Thus Chesney suddenly finds himself inseparably connected with a gentleman who has committed at least one capital crime, and who is bound to some exceedingly indefinite country on the other side of the globe. After a few more adventures he embarks with Kavanagh and Murphy in an emigrant ship, many of whose passengers are tenants from the ancestral estates of the Kavanaghs, who all share Murphy's sentiments of unquestioning loyalty to their young master. Two or three most uncomfortable circumstances speedily develop themselves. In the first place, Mr. Kavanagh has a series of fits of *delirium tremens*, which are perhaps some excuse for his homicidal propensities, but which do not make him a more agreeable companion. Murphy, moreover, shows a strong disposition to throttle anybody who disputes his master's opinions on any occasion, even if they are the opinions of a raving madman. And, finally, another friend of Kavanagh's turns up, named Maguire, who has spent the best years of his life in following the profession of a good old-fashioned pirate, with a black flag and a code of laws of the old buccaneering type. Mr. Maguire is a bit of an anachronism, as he has evidently stepped straight out of the seventeenth century, but that is a trifle in a story of this kind. The ship, with this delightful crew, presently reaches an island which has been lately thrown up by a volcano in a part of the Southern seas previously supposed to be of unfathomable depth. The whole party immediately land under the green flag and found a small Irish Republic; so Irish indeed, that Mr. Kavanagh is instantly recognized as absolute ruler by divine right. In this capacity he promulgates a series of laws with the help of a large supply of whisky and of his henchman Murphy. The punishment is in every case death, and a certain Pat Doolan is the first victim, being summarily executed for the offence of going to sea in a boat. It is, of course, not to be expected that an Irish Government, even when in the hands of a native and absolute ruler, should be without a conspirator, and the piratical Maguire acts with some energy in that capacity. Poor young Chesney, who is a domestic Englishman of the ordinary type, begins to feel himself in rather a false position. And he is the more uncomfortable as, in his enthusiasm for the murderous maniac who is now his absolute sovereign, he has written home for his affianced bride. He begins to think that he has made a trifling mistake. Young men should not swear eternal fidelity to the first wild Irishman whom they find galloping across country at night pursued by the police. The brutal Saxon, when he is in a minority of one in an island ruled by a drunken madman, and distracted by the intrigues of a veteran pirate, is in a very awkward position. It is still worse when the lady of his affections appears one fine morning, expecting to find herself in a flourishing colonial settlement. We must remark, by way of parenthesis, that the author of this remarkable narrative had better be on his guard. If there happen to be any Fenians in the district which he inhabits, he will be in danger of receiving some strong remonstrances for his base caricature of Irish ideas. He will be suspected of being in league with Mr. Froude for the purpose of destroying our respect for the virtues of the Celt. However this may be, poor Mr. Chesney has now arrived at one of those desperate positions from which he can only be rescued by the most vigorous interference of the author. In fact, he gets into a small boat with his young lady, and purposes to sail to Australia—a voyage in which the chances are about fifty to one in favour of his being swamped by the first breeze. Unluckily, as it seems, he is perceived from the island, and the ferocious Murphy puts out after him in the only other boat, with a crew of three powerful Tipperary boys. They speedily overhaul Chesney and his intended, and are carrying them back to the island, where Chesney is promised to be hanged the same evening, and where his bride is to have the choice between death and becoming Mrs. Murphy. We hold our breath in cruel suspense—a suspense which, it may be remarked, is all the more trying because we have only just reached the opening pages of the second of the two volumes. What series of events, we ask, can possibly be devised which will sustain the interest already excited? The materials brought together on this "tight little island," as Mr. Kavanagh calls it, in the words of the popular song, are of so inflammable a character that we do not see how an explosion can possibly be evaded much longer. We expect that a catastrophe will occur like that which is described in one of Marryat's stories, where a body of pirates on a desert island manage in a single page to kill each other off down to the last man, and that the author will have to come forward, like the prompter in a mythical English tragedy, and apologize for the premature death of all his characters. In fact, a terrific catastrophe occurs, for which we ought to have been prepared by certain hints dimly thrown out beforehand. As the boat is slowly making the island, the island itself suddenly goes down. As it had been thrown up by a volcano, it disappears in an earthquake, and no more is heard of Mr. Kavanagh, Mr. Maguire, or any of their amiable subjects and allies. The faithful Murphy hereupon jumps overboard with the view of joining his master in another and a better world; and Mr. Chesney returns to England with a large number of bank-notes, received from Mr. Kavanagh in one of his lucid intervals, marries, and lives very happily ever afterwards. He is supposed to have confided this narrative to the author in after years, and he appears to have found a very receptive auditor.

One difficulty remains. This abrupt termination of the story happens at the beginning of the second volume, and we are affected by the same sort of surprise with which Mr. Pickwick heard from Weller of the tragic end of the gentleman with the muffins. The story has gone down with the island, and what then is to become of the remaining pages? The answer is very simple. They are filled with a miscellaneous collection of stories, old and new, which, on the whole, are worthy of their predecessor. As a rule, indeed, they are of a more purely comic order, and are lively and amusing enough. Coming after so startling a narrative as *Murphy's Master*, they are probably intended to relieve our feelings on the same principle on which a terrific melodrama is succeeded by a farce. It would, however, be unnecessary to indulge in any detailed criticism of their merits. We cannot honestly say that the book is destined to take its place on our library shelves by the side of the novels of Fielding, Richardson, or Scott; but if any of our readers should be about to take a railway journey of a couple of hours' duration, they might do worse than beguile the time by a perusal of *Murphy's Master*.

NOTICE.

We beg leave to state that we decline to return rejected communications; and to this rule we can make no exception.

The SATURDAY REVIEW *is duly registered for transmission abroad.*

The publication of the SATURDAY REVIEW *takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.*

Nearly all the back Numbers of the SATURDAY REVIEW *may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.*

Now ready, VOLUME XXXIV., bound in cloth, price 16s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW *Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.*

No. 919, Vol. 35. June 7, 1873. [Registered for Transmission Abroad.] Price 6d.

PARLIAMENT FROM EASTER TO WHITSUNTIDE.

IT is in the nature of things that the last days of a Liberal Government should be tame, and the last days of a Conservative Government exciting; for when a Liberal Government is approaching the end of its power it is falling because the public is too quiet and peaceful, and when the same thing happens to a Conservative Government it falls because the public is too eager and excited to allow of its prospering. Since Easter the present Government has had an opportunity of showing how very tame public life can be when a Liberal Government is in office, pretending to do little and doing less, and yet fully answering the calls of public sentiment. The Government makes no way with legislation. The Judicature Bill has got through the House of Lords, and this is literally all that can be said. Lord CAIRNS, the arbiter of Lord SELBORNE'S fate, has damned the Land Transfer Bills with mild approval, and consigned them to the limbo of a Select Committee in June. The measures of the Government with regard to Local Taxation are only the beginning of a beginning, and excite no interest, if they provoke no very violent opposition. As to the other measures of the Government, where are they? The ATTORNEY-GENERAL'S Jury Bill appears to be running aground on the shoals of local taxation; and there is as yet no sign of his promised measure for codifying the law of Evidence, or of the Bill to amend the Education Act. The Ministry carries on happily and easily as if it were in the midst of a perpetual Long Vacation, and could sit for endless hours by the seashore, having given directions that no letters should be forwarded to its address. Its opponents are only too happy to enjoy their Long Vacation also. They scarcely ever attack it, have nothing of their own to propose, and no remarks to make about anything. If, as he recently remarked, he were in office, Mr. DISRAELI would have a policy about Central Asia and Local Taxation, and a hundred other things; but, being out of office, he has simply no policy at all. It is said that the Session is likely to be a short one, and that for once in a way members of Parliament may this year see the 1st of August in the country. No one can wish them to be kept in London a day longer than decorum absolutely demands. They have nothing to do, and need not be kept too long in doing it. If either side wished for a dissolution this year, things would be very different. There would be some stir and excitement, and every side issue might be made a field of battle. But the supporters of the Government are very anxious to have one year more of Parliamentary life, seeing how probable it is that they may never have another. The Government is willing to oblige its followers, and cannot but acknowledge that office is a little less wearisome and exhausting when its occupants are not called on to do anything more than continue their official existence. The Conservatives are very unwilling to pluck their pear before it is ripe, and they think that a year will tell in their favour, and are not sorry to see the great GLADSTONE Government, with its wild energy and blazing measures, sink into the safe mediocrity of a humdrum repose. The Bath and Gloucester elections seem to show that the sun is beginning to get hot on the fruit; but they are willing to leave nature alone, and will not attempt to enjoy it till time makes it drop into their lap.

It is only on minor questions that there is every now and then a little burst of excitement, and the House of Commons relieves its dulness by backing or thwarting the Ministry. The Government is still the Government, and, if it tries, it can generally command a vote. Its most conspicuous triumph was the vote on the question of Emanuel Hospital, when it got together a majority of more than forty to defeat the combined forces of the City members and the Conservatives. Those who voted with it had, however, the satisfaction of thinking that they were not only supporting their leaders, but showing their independence of the Corporation of London, which has a Parliamentary influence great enough to warrant a considerable amount of jealousy; and although not a few Liberals would quite agree with their opponents in criticizing many of the acts of the Endowed Schools Commission, yet there are so many districts, and especially in Scotland, where funds available for sound projects are at present wasted, that it is useful to uphold the general principle that wide reforms may be insisted on with regard to charitable endowments, although any particular scheme may be faulty. The Government also succeeded in upholding the official resolve to make Oxford a military centre, and Mr. TREVELYAN'S proposal to limit the number and curtail the emoluments of English officers was very summarily disposed of. The Bill for the Preservation of Peace in Ireland was also readily passed, and the meagreness of the opposition to it showed how very small is the section of Irishmen who are willing to live themselves in the discomfort of anarchy in order that they may gratify their desire to injure and annoy England; while the short debate which the Bill elicited sufficed to show that one very advanced Irish member had the courage and sense to denounce the notion that the Irish people were really represented by the noisy patriots of the capital. If the Opposition had any earnestness in its resistance to the Government, or any financial policy of its own, it might have subjected the Budget to very effective criticism; but it never got beyond a few desultory questionings and incoherent objections, and thought that enough had been gained when the Conservative leader found an opportunity of raising a laugh at Mr. LOWE'S exhibition of what Mr. DISRAELI termed his Australian education and manners. When the unfortunate subject of the *Alabama* award was once more made a subject of discussion, the Government had in Sir STAFFORD NORTHCOTE a necessary ally, and Mr. GLADSTONE showed that he was making satisfactory progress in the official art of saying little in many words. The Irish Tests Bill was not looked on kindly by the Government, and Mr. GLADSTONE at first showed the irritation which his defeat had caused him by the reception he gave it; but a milder spirit came over him, and the passing of the Bill, which was inevitable, was not suffered to be converted into a victory over the Government. But another question connected with the interminable religious disputes of Ireland has already given the Ministry some trouble, and is likely to give it more. It was only by a very small majority that it got the House to ratify its proposal to postpone the debate on the O'KEEFFE case until a Select Committee had heard all that the members of the National Board, whose conduct was impugned, might choose to say; and it sustained an unmistakable defeat when it attempted to resist the addition to the Committee of two members chosen on account of the supposed independence of their Parliamentary position. Such a defeat on such a very small question does not much hurt the Government; but what does injure it is, that it should show such evident signs as it has exhibited in regard to the O'KEEFFE case that it is utterly perplexed, and that it is glad of any respite in order that it may gain time to see in what direction it ought to move.

An expiring Parliament under a languid Government has, however, one sphere in which it acts with force and feels a playful delight in proving that some of its old energy is left. It can extinguish with merciless resolution the crotchets of amateur reformers. The authors of such crotchets and their followers have had a very bad time lately. No political season could, in fact, be more unfavourable to them. When the Liberal party was in the first flush of its great victory, when no proposal seemed too bold for the Government to make and

carry, when the air seemed alive with hope and excitement, everybody thought that he might suggest something, and that one suggestion was nearly as good as another. Little cliques gathered themselves together, and took action, and were boisterous and confident and domineering. Nothing was to be done until they were satisfied and their especial fancy was incorporated in the Statute Book. Hereafter, a Conservative Government in search of a policy, and anxious to stave off important changes by making unimportant ones, may dally with some of these framers of crotchets, and be inclined to buy ideas and support at the same time. But a tired Parliament, with a tired Liberal Ministry to guide it, and a tired public to keep watch over it, is in a frame of mind entirely alien to the favourable consideration of proposals which seem destined to wake up bitterness and give endless trouble and annoyance without effecting any tangible and indisputable good. Since Easter the House of Commons has rejected by overwhelming majorities a proposal to repeal the Contagious Diseases Acts, the Permissive Bill, a scheme for the State purchasing Irish Railways, a proposal to admit women to the franchise, Mr. MIALL'S Bill for the Disestablishment of the English Church, and Sir CHARLES DILKE'S motion for the redistribution of political power. On the occasion of the discussion of the last two of these schemes, Mr. GLADSTONE candidly invited the advanced party to look at the actual state of things in the constituencies. He did not hesitate to say that the next Parliament will be much more Conservative than the present one. Every one knows this without hearing it from Mr. GLADSTONE; but it necessarily makes some difference in the conduct of the present Parliament when it hears from the head of the Government that he is already obliged to take into consideration the altered temper of the electors. There is nothing whatever to regret in the defeat of any one of those six proposals, and it is much better that the House of Commons should express its opinion about them so unmistakably as to make the renewal of them at any near date almost hopeless. We may also be glad that, for the first time since he occupied his present office, Mr. BRUCE had the pleasure of appearing quite firm and decided on some of these questions, and that the knowledge that he was opposing opinions generally condemned, and helping to crush a cause that had no hope of success, inspirited him to appear in the new character of a man with definite opinions, which he could sustain with sensible arguments. He was as determined as the leader of a forlorn hope in the denunciation of the Permissive Bill, and of the Women's Suffrage Bill, and spoke out like a man on both of these dangerous subjects. But it may be observed that, however good a thing it may be that the House of Commons should be thus peremptory in its treatment of fanciful political schemes, and that the HOME SECRETARY should console himself for the timidity and uncertainty with which he has received a thousand deputations by his vigorous leading of an assured majority, yet this energy is only one symptom of a Parliament which is long past its prime, and is unfit for much labour of any kind. The strength to resist doing bad work goes along with the weakness to do good work; and the House of Commons, whether putting its extinguisher on crotchets, or coquetting with the Rating Bill, or giving a fitful support to small Ministerial proposals, is equally aiming at that which it feels to be its one appropriate goal, the end of the Session.

THE SHAH ON HIS TRAVELS

THE visit of the Shah of PERSIA to Europe may possibly have political consequences, but at present it is interesting chiefly because it is odd. For a short time Oriental potentates have the opportunity of producing the picturesque effect which always results from incongruity. The gorgeous seclusion which has for ages imposed on the imagination of their subjects is disturbed, not by a gradual descent into ordinary life, but by journeys in railway carriages and voyages in steamboats, which are minutely recorded in Western newspapers for the amusement of a civilized and infidel population. The change is perhaps rendered somewhat more gradual by the accident that Moscow is a stage on the road to Berlin and London. Splendid military pageants are not unlike the traditional diversions of Eastern Kings, and probably Circassian and Georgian regiments, representing the transition from Asia to Europe, may have taken part in the ceremonies of reception. In Germany there are as many disposable troops not less showy or solid than the Russian battalions, and probably the royal visitor understands military matters well enough to appreciate the irresistible superiority of European armies to his own levies of irregular horsemen and ill-trained infantry. It will be no advantage to himself or his country if he returns home bent upon imitating the great armaments which he will have seen, instead of studying the resources which civilized industry provides for the purposes both of peace and of war. Royal travellers seldom find facilities for understanding the economical condition of the countries which they visit in state. It is natural to honour illustrious guests by the display of all the most impressive objects which can be procured, and it happens that military establishments are as ornamental as they are formidable. Uniforms and banners and regimental bands outshine all peaceful competition, and Continental rulers have always affected the character of professional soldiers. The Shah of PERSIA has probably been thus far confirmed in the belief which he may have inherited, that war and preparation for war are the paramount business of mankind. He has no reason to suspect that he has been treated with any deference to the childish or semi-barbarous tastes which might have been attributed to an Asiatic potentate. The most powerful of European sovereigns, himself a veteran soldier, has within a few weeks been entertained at St. Petersburg with a long succession of reviews and parades. It never seems to occur to Emperors and Kings that the great armies which they proudly exhibit to their visitors are exclusively maintained for the purpose of killing and maiming one another's subjects in the contingency of a quarrel. The German EMPEROR, then King of PRUSSIA, reviewed large bodies of French troops only a few years before his march to Paris. There is little chance of a rupture between Germany and Russia; but if any cause of dispute were to arise between them, their respective Ministers and generals would immediately begin to calculate the forces which either Power could in case of necessity bring into the field. Even when regular armies become reduced in strength, as at the present moment in Spain, the graver evil of an armament of the rabble is substituted for a great military establishment. Europe is not in a condition to lecture Asia on the blessings of peace.

It has been suggested that the comparative deficiency of England in materials for military pomp should be supplied by a display of naval power. One newspaper correspondent proposes that the Royal yacht with a portion of the Channel fleet should receive the SHAH at Calais or Ostend, and conduct him up the Thames to London. There is no doubt that the novelty of the sight would be impressive, and the mercantile shipping in the river and the docks could scarcely fail to astonish an inland-bred visitor; but unluckily Persians can scarcely be expected to be good sailors; and there is reason to fear that the SHAH might not be at leisure to appreciate the merits of ironclad vessels. It may also be remarked that a certain amount of knowledge is required to produce astonishment or admiration. A child is surprised at nothing, because it has no standard of comparison; and it is probable that a Persian sovereign would scarcely be able to distinguish between a steam-packet and the latest product of destructive marine architecture. It is nevertheless to be hoped that salutes will not be stinted, for the sound of cannon and the smell of powder are always attractive to the senses of Royalty. The Court carriages and horses will perhaps hardly satisfy the expectations of an Eastern prince; but it is proper that every effort should be made to pay the SHAH suitable attention. Buckingham Palace, with all its defects, is better than an hotel; and as a visit to Windsor is arranged, he will see one Royal residence of unequalled grandeur. For the rest, the sights best worth seeing in England are London and its population.

If it is desirable to convince the SHAH that the friendship of his great Indian neighbour is worth having, he must be supposed to have already learned the rudimentary proposition that wealth and numbers are the chief elements of political power. In no other capital will he see such crowds as in London, and popular curiosity will ensure the assemblage of multitudes wherever the SHAH may direct his course. Some members of the Persian Royal Family once published an account of a visit to England full of characteristic exaggerations of the number and splendour of the objects which excited their admiration. The London of the present day, if it is deficient in artistic beauty, requires no Oriental hyperbole to describe its riches. Modern reforms have happily not yet reached the body which has assumed to itself the exclusive right and duty of representing the public hospitality of England. The Court functionaries who are charged with the office of entertaining the Royal guest naturally apply to the LORD MAYOR to relieve them of a portion of their obligations; and the SHAH, like many other illustrious personages before him, will be solemnly enter-

tained at the Guildhall. The freedom of the City will be presented to him in a suitable form; and his name will be thenceforth enrolled among the citizens of London. It has not been stated whether, like the Ottoman Sultan, he will become a Knight of the Garter. As the principal dignitary of one of the great Mahometan sects, he might prefer a plausible claim to be placed on a level with the more orthodox Caliph who reigns at Constantinople. If the Persians have been less connected with English policy than the Turks, they are also not obnoxious to the prejudices which are in some quarters entertained against the infidel rulers of a Christian population. Both nations have passed into a stage of decadence.

The first lesson which modern Asiatic sovereigns learn when they enter the pale of civilization is the art of contracting national debts; but it is not known that the Shah or the Ministers who accompany him are at present bent on borrowing money. The Persian Government has already contracted with a foreign capitalist for the construction of railways in a country which is still unprovided with roads. The Shah's dominions have been left outside the new project of M. de Lesseps; but Ispahan and Teheran will probably be provided with railway communication as early as Samarcand. It is doubtful whether a poor, ill governed, and thinly inhabited country will be capable of any considerable improvement. If there are patriots in Persia, they must regard as the chief national danger the probability that the kingdom may become virtually or nominally a province of the vast Russian Empire. Jealousies against the Turks on one side, and the Afghans or the Indian Government on the other, are a waste of vigilance and of energy. The object of Anglo-Indian statesmen has always been to maintain the independence of Persia, and at the same time to resist encroachments which would ultimately redound to the advantage of a more formidable Power. Even if the destined boundaries of English dominion in the East had not already been reached, Persia has never been included among the possible appendages which might be added to the Indian Empire. As long ago as the beginning of the present century the business of English diplomacy was to check the influence which Napoleon attempted to establish at the Court of Persia. It is now expedient to counteract as far as possible the ambitious designs which may from time to time be entertained by Russia. It is greatly to be regretted that Foreign Secretaries have successfully insisted on retaining for their own department the conduct of Persian affairs. The present Envoy was known to be unacceptable to the Persian Court; and he has had no means of becoming acquainted with the relations between the Indian Government and Persia. Our knowledge of the native Governments of India furnishes civil and military administrators with a clue to the motives and inclinations of Eastern Courts. Ministers and favourites are not exclusively devoted to the service of their sovereign and their country, nor is it always easy to ascertain the true seat of authority and of influence. The greatest advantage which an Oriental monarchy can possess is to have a chief who personally directs the affairs of State. An hereditary king, in Asia as in Europe, is identified in interest with the country which he governs, while his counsellors may have many collateral objects in view. The activity and spirit which the Shah has exhibited in his visit to the European Courts seem to indicate a capacity of acting for himself, and a resolution to form independent political judgments. It is said that a traditional law prohibited the Persian sovereign from leaving his dominions, except at the head of an army; but a vigorous despot is not easily hampered by customary superstitions. It is hardly possible that the Shah's excursion should fail to produce some changes in the theory and practice of his Government. As he moves westward, the condition of society becomes more and more unlike the state of an Eastern kingdom; and he will find that the signs of material prosperity are more visible in England than in Russia or even in Germany.

MINISTERIAL PROSPECTS IN FRANCE.

ADVERSITY has had its proverbial effect upon the Orleanists. Almost from the day that their Princes took their seats in the National Assembly the prospects of the party have been steadily growing worse; and if they have at length succeeded in checking the progress of the country towards the definitive adoption of Republican Government, it has been at the cost of allying themselves with persons and principles which they have passed their lives in repudiating. Under the Empire such instructions as those which the new Minister of the Interior has given to the prefects would have called forth a series of sarcastic criticisms from Orleanist journalists. The cool intimation that the prefect need not trouble himself as to the legality of the Minister's orders, because he will always be covered by the Minister's responsibility, and the direction to interfere on behalf of the Government candidates in every election within the reach of his influence, would have been cited as proofs of the essentially arbitrary character of the Imperial rule. The return of an Opposition candidate would have been welcomed as a fortunate instance of resistance to official tyranny, no matter what might be the precise colour of his politics. Yet the first public act of the Duke of Broglie's Ministry is to establish relations with the prefects which ten years ago the Duke of Broglie himself would have denounced as incompatible with personal or electoral liberty. We hear no more talk of decentralization, no more lamentations over the exaggerated influence exercised by the Executive in matters with which it has no concern. The Duke of Broglie allows a colleague to issue a circular which contradicts the doctrines to which he has hitherto been supposed to be devoted, without so much as a word of explanation. Nothing has been added to veil or soften the naked Imperialism of M. Beulé's language. The Duke of Broglie has evidently satisfied himself that, if Frenchmen are let alone, they will not go in the way in which the Orleanists wish them to go; and when once his mind is made up on this point, he has no objection to adopt the tactics of M. Rouher. There is a weak point in this reasoning which has probably escaped him. If Imperialist work has to be done, the chances are that in the end it will be best done by Imperialist workmen. The Duke of Broglie may do his utmost to show that he can carry on the business of administration as well as though he had been serving the Empire all his life instead of opposing it, but he will be in considerable danger of breaking down somewhere. Some piece of policy which he will be expected to acquiesce in may prove too much for his pride or his honesty, and he will then have no choice left but to separate himself from a coalition which may by that time have grown too strong for him to break up. This is the rock ahead of every Orleanist member of the new Cabinet who has not entirely succeeded in subordinating conscience to convenience. Legitimists and Bonapartists may pull together up to the moment of deciding whether the principle of monarchy shall take form in the person of the Count of Chambord or of the Prince Imperial, because, though the ends for which they work are different, the means by which they work for them are identical. But the Orleanists cannot so entirely dismiss all consideration of means; at least, if they do, their justification for maintaining a separate existence falls to the ground. An absolute Monarchy may consistently be reimposed by force or fraud. In either case it is but the re-entry of a master who has been unjustly dispossessed, and who is not bound to give any account to his refractory servants of the way in which he has regained his authority. But a Constitutional Monarchy does not easily lend itself to these methods; and if the Orleanists once let this distinction slip, they will inevitably be merged in one or other of the more vigorous, because less scrupulous, parties with which they are for the moment associated.

As yet France has certainly profited by the exceedingly mixed character of the new Ministry. The impossibility of agreeing among themselves as to a dynasty has forced them to dispense with any agreement as to the form of government. The circular addressed by the Duke of Broglie to the French representatives abroad expressly reserves this question for the decision of the Assembly, whenever it shall think fit to declare its will. The Versailles Compact turns out, after all, to be only the Bordeaux Compact regilt. The representatives of three Monarchical parties have taken possession of the Government, only to find themselves still forced to put up with the Republic. Their sole claim to replace M. Thiers is that they, not being Republicans, are better fitted to administer the affairs of the Republic. That the leaders of the coalition should be assured of this truth is not wonderful, since in their eyes the best administration of a Republic will be that which gives the best promise of bringing the Republic to a speedy end. But it is not quite so certain that their followers, when once their extreme terror at the Paris and Lyons elections has had time to abate, will continue to share this conviction. Even among the deputies of the Right Centre there are probably some who believe that Republican Government is a necessity in France, and that any further delay in recognizing this fact will only tend to give strength to the Radicals. Those who take this view may not long be content with a Ministry composed of men who are believed to be only Republicans until they can agree which of

the three Pretenders they shall restore. If they could persuade themselves that the MINISTER of the INTERIOR will control the elections as completely as his predecessors under the Empire did, they would be more at their ease, inasmuch as they would then begin to suspect the accuracy of their impression as to the necessity of a Republic. But there are several considerations which tend to throw doubt upon the Minister's powers in this respect. It is true that under the Empire the Government did exercise a very great influence over the elections. But even under the Empire the sphere of this influence was constantly becoming more contracted. The Opposition in the Corps Législatif grew in numbers every year, until at length it was no uncommon thing for an official candidate to be beaten even in a rural constituency. If the claims of the present Government to unquestioning submission on the part of the electors are compared with those of the Empire, they will be seen to be very much less. In the first place, the Empire itself has fallen into disgrace, and its fall must in some degree have discredited the whole system of Ministerial interference. It is one thing to submit to a prefect who speaks as the representative of an idol which commands unquestioning worship, and another thing to submit to a prefect who speaks as the representative of an idol which has been discrowned and overthrown, and has been set up again under another title. The success which attended the prefects in the former character is not conclusive evidence that equal success will attend them in the latter character. In the next place, the Empire was able to appeal to the peasantry as the one refuge open to them from the advance of socialism. The new Government will of course try to present itself in the same light, and if it had succeeded to office upon M. THIERS's death, instead of upon his resignation, it might have contrived to gain its point. But for more than two years the peasantry of France have been accustomed to regard M. THIERS as their protector against revolution, and his retirement from office will not make him a less conspicuous person in their eyes. On the contrary, it is quite possible that he may be a better known man as leader of the Opposition than he could have been if he had remained President. His opportunities of speaking will be more frequent, and he will be less restrained in the use he makes of them. The Administration will for the first time in France have a rival asserting that he is better able than the Administration itself to give the country the security it desires, and this rival will enjoy the superior prestige which belongs to a two years' success in the face of unexampled difficulties. In the third place, the sufferings and anxieties which the French people have undergone since the capitulation of Sedan must have done something for it in the way of political education. It has shewn them how weak a seemingly strong Government can be; it has shown them that a Republic, even a Radical Republic, may have higher and more patriotic aims than the mere confiscation of private property. If the educated classes are still frightened at the mention of M. GAMBETTA's name, it remains to be seen whether the peasantry have not in some measure got over their terrors.

These considerations are important in two ways. They make it doubtful whether the new Government will get a majority in a general election, and by this means they may dispose the wavering members of the existing majority to desert it, even before a general election. It must be remembered that the division which deposed M. THIERS was extremely narrow. Sixteen Republicans deserted their party at the last moment, and if only half of this number had remained true, M. THIERS would have had a majority on his side. If these gentlemen see cause to think that the country will not confirm the decision of the Assembly, they may think it prudent to retrace their steps while there is yet time to do so with some effect. M. TARGET, who led the secession on the 24th of May, admits that when he visited his constituents a month ago they all—manufacturers, merchants, farmers, landowners, workmen—agreed in urging him to vote for the definitive organization of the Republic. M. TARGET defends the vote he actually gave by the plea that he found his constituents equally energetic in favour of a policy which should reassure Conservative interests. It is possible, however, that his constituents may find means of convincing him that they are not reassured by seeing the organization of the Republic indefinitely postponed, and the country consigned in the interval to the tender mercies of a monarchical coalition, which wants even the unity required for giving shape to its own wishes. In that case M. TARGET, or, if not M. TARGET, some of the less conspicuous members of the Sixteen, will perhaps treat the Duke of BROGLIE as they treated M. THIERS a fortnight ago. The desertion may come with as little warning, and may have an equally decisive result.

THE TRADE-UNIONISTS IN HYDE PARK.

THE Trade-Unions meeting in Hyde Park probably amused its members better than an ordinary excursion, although some of the speakers professed to regret the interference of public duty with seasonable recreation. Assemblies of this kind are more or less directly collected for purposes of intimidation; and to a certain extent the promoters succeed in their object. The demagogues who address the crowd scarcely make any pretence of reasoning; nor could the most fulsome of after-dinner declaimers improve on their adulation of the class which forms their immediate and exclusive audience. The multitude of artisans probably listens with eagerness to the assurance that the prosperity and tranquillity of England are due, not to good laws or to upright administration, but to the wholesome influence of combinations of workmen. The upper and middle classes are collectively denounced as selfish and worthless, and the outrageous assertion that the clergy are exceptionally cruel naturally produces sympathetic applause. Members of Parliament are, it seems, habitually drunk or asleep during the discharge of their legislative duties; and some at least of the Judges are unjust and tyrannical, if not corrupt. One of Mr. ODGER's proposals, though in other respects it is not worth discussing, is highly characteristic of the tendencies of revolutionary agitators. It was suggested that a Minister of Justice, irresponsible to the Government or to Parliament, should be elected by universal suffrage, and charged with the duty of dismissing judges and magistrates who passed unduly severe sentences. As the institution would of course be established exclusively for the convenience of Trade-Unionists, it may be assumed that judges of severe temperament might with perfect impunity put the law in force against all other offenders. During his long course of agitation Mr. ODGER has perhaps supported more dangerous schemes; but it may be doubted whether his ingenuity has yet devised so extravagant and unreasonable a project. Nothing is easier than to make revolutionary speeches; but the demagogues have some reason to boast of their success in assembling large bodies of adherents. The attachment of the leaders to the cause of law and order was sufficiently indicated by their choice of a dismissed policeman to take a prominent part in the procession. Any person who has become notorious by coming into collision with lawful authority is the natural ally of the Hyde Park agitators. A policeman who has failed in organizing a strike of his comrades, or a gas-stoker who has attempted to deprive the metropolis of light on a winter night, acquires the right to be considered as a hero or a martyr. A regular march of several thousand persons who hold similar opinions is not a reassuring spectacle. On the other hand, the more timid sections of society are not unlikely to overrate the danger. It is probable that a large part of the crowd assembled on Whitsun Monday would refuse to concur in any open violation of the law. The demagogues who hope to terrify the peaceable classes by menaces of possible disorder find it prudent to warn their followers against immediate violence.

It is unlucky that two country justices should have furnished an ostensible pretext for a gathering which would have taken place if Chipping Norton had never been heard of. The farmers of the district by no means share the indignation of declaimers and censorious journalists against the local Bench. The Agricultural Labourers' Union, which is the most mischievous as well as the latest of industrial combinations, had induced all the workmen in a parish in Oxfordshire to leave their employment on the refusal of their masters to concede a large advance of wages. As Nature will not wait for the termination of social disorders, the sudden interruption of farming operations may cause the most serious evils. It was urgently necessary to supply the places of the Unionists who had struck; and the principal farmer in the parish succeeded in hiring two men to take the places of his former workmen. The labourers on strike were probably advised by the agents of the Union not to expose themselves to the penalties of the law; and it was thought that the object of driving away the new comers would be not less effectually obtained if women were employed for the purpose of intimidation. A score of angry viragos with sticks and vituperative tongues cannot be altogether despised, especially as any attempt to retaliate would expose their victims to the vengeance of the husbands and brothers who were without doubt watching the effect of their vicarious demonstration. Ultimately the workmen obtained the protection of a policeman, and the feminine riot seems after all not to have been desperately formidable. The magistrates not unnaturally thought that the attempt to intimidate was highly culpable; and they found that under the Act they were not at liberty to impose a fine. Their

error consisted in treating women as equal to men. Common sense modifies the strict rule by according in many ways a comparative license to the ferocity of the gentler sex. The Spanish proverb that white hands convey no insult even by a blow, was perhaps not literally applicable to the rural offenders; but the magistrates might have considered that allowance should be made for women prompted by their husbands, and a riot which was quelled by a single policeman could not be of a highly aggravated character. If it is true that some of the women who were committed were at the time nursing infants, they can scarcely have meditated any violent assault even before the policeman appeared. A rebuke and an intimation that a second offence would be strictly punished would in all probability have met the necessities of the case. Nevertheless it is not surprising that the farmers of the neighbourhood should be more deeply impressed by the heavy risk which they incur, and by the mischievous influence of the Union, than by a chivalrous deference to female disturbers of order.

The Liberal party has little reason for gratitude to Mr. Odger or Mr. Arch, for the Hyde Park meeting, though it was comparatively unimportant, may perhaps cost the Government half-a-dozen votes at the general election. The course of recent elections has been in some degree determined by the hostility of the Licensed Victuallers to the present Government, but the revolutionary projects of the professed leaders of the working classes, and the oppression practised by the Unions, have alienated the great body of traders of all ranks from the Liberal cause. The pretension of political artisans to a monopoly of power has an unfortunate tendency to create a horizontal stratification of the community, in place of the old-fashioned vertical cleavage according to diversity of taste and opinion. In the counties which have been disturbed by the Labourers' Union, the farmers will have the strongest motives for voting against the party which has countenanced the extension of household suffrage into counties. The selfish arrogance of the demagogues of the London clubs necessarily alienates all classes except those which live by manual labour. It matters comparatively little what is the immediate pretext for agitation; but the demand for a repeal of the Criminal Law Amendment Act directly affects the interests of employers. It may be a fair question for discussion whether the law really requires alteration; but the claim advanced at the Hyde Park meeting extends to absolute immunity from the consequences of any breach of contract. A workman is, as a rule, practically exempt from liability to pecuniary damages; and no alternative has been suggested for the penalty which has hitherto been incurred on desertion of his employment. It is still more necessary that intimidation practised against competing workmen should be criminally punishable. The agitators allege, with a certain show of truth, that in cases of trade intimidation the employer rather than the injured workman ordinarily complains of the outrage. The victim well knows that he is liable to a repetition of the annoyance which he has suffered; and it is the plain duty of the master to ensure him protection by enforcing the law. Lord Fitzwilliam has shown himself to be a true friend of the working classes by his determined resistance to a conspiracy of Unionists to persecute and ruin one of his colliers for refusing to subscribe to the Union. In this instance, the Unionists endeavoured to coerce the employer into becoming their accomplice by subjecting him to heavy pecuniary losses in the working of his pit, but they would probably have resorted to a simpler process of ridding themselves of the obnoxious workman if they had not been deterred by fear of the law. To the plausible complaints of class legislation it is a sufficient answer that punishment must follow the offence, which is exclusively confined to Unionist workmen.

It would be idle to appeal to the fairness or moderation of the Unionist agitators by reminding them of the effect of their doctrines and practices as they are exemplified on the Continent. Mr. Odger, who took the chief part in the Hyde Park meeting, was at one time President of the International Association, though there is reason to believe that he was unconsciously an instrument in the hands of conspirators who meditated profounder designs. The Commune of Paris was closely allied with the International Society, which is at present actively engaged in rendering government impossible in Spain. In both countries the schemes of the revolutionary faction are regarded with terror and abhorrence by all classes of society above the lowest. Gambetta, who is not himself a Communist, did much to cause the late reaction in France by his significant promise to transfer power to a lower social stratum. The long-established freedom of England has been rendered possible by the absence of any appeal to material force. The organization of street processions in London may perhaps not be prohibited by law, but it is dangerous to order and good government, because it is primarily intended as a threat. It is possible that a future generation may find it necessary to restrict liberties which are systematically abused. Paris has now for more than two years been subject, with the approval of all good citizens, to a state of siege. If larger license is allowed in London, the merit belongs to the institutions which the demagogues habitually denounce. The propagation of mutual distrust and hatred among different classes of the community has been in all ages the favourite business of demagogues; and pretexts for agitation are never wanting. It is to be regretted that in two or three cases unduly severe sentences have been passed on men or women who had violated the law; but if the London gas-stokers and the Oxfordshire labourers' wives had never been prosecuted, the brawlers of Hyde Park would not have been less loud in their denunciations of the magistracy and the clergy. The next general election will show whether the revolutionary agitators have secured to themselves any considerable share of political power.

THE PRUSSIAN ECCLESIASTICAL LAWS.

SHORTLY after the passing of the four Acts which have introduced so remarkable a change into the ecclesiastical system of Prussia, the Catholic bishops immediately affected by them met together, and it is now announced as the result of their deliberations that they cannot possibly accept the new order of things which is to be imposed upon them. They will resist so far as resistance may be possible, and, if they obey, they will only obey under protest. It was scarcely possible that they should come to any other conclusion, for these Acts are a negation of every claim which the Romish Church makes in its dealings with the State. The Prussian priest will be nominally uncontrolled in his spiritual functions, but the State will interfere with him at every turn, and will exercise over him a ceaseless control. The details of these Acts are well worth studying, for it is only by reading their provisions that we can understand how severe is the pressure which the State is to exercise. From the first moment when his preparation for his sacred office begins the State takes the priest in hand; it sees that he is educated properly, sanctions the exercise of his functions, removes him if he offends against secular law, restrains his action towards his fellows, and allows him to enforce none but spiritual penalties against the laity. Certain provisions are made in favour of those who are already priests, or who are on the point of becoming priests; but, for the future, the new system of control will be rigidly applied. In the first place, none but a German or a naturalized foreigner is to exercise spiritual functions in Prussia; and the German who exercises them must be a German educated in a particular way. He must first duly pass through a gymnasium; he must then go through a three years' course of theological study, either in a State University or in a seminary under State control; and, lastly, he must satisfactorily pass a public oral examination conducted by State officials, the object of which is to show that he possesses what the Act terms the knowledge peculiarly necessary for his calling—that is, the knowledge of philosophy, history, and German literature. No new seminaries are to be established; students in the Universities are not to be allowed to belong at the same time to seminaries; and it is only if he lives in a place where there is no State University that a student may go to a seminary at all; while every teacher in a seminary must show that he has received an education satisfactory according to a lay standard. Nor will the priests in future be permitted to get hold of the young and give them a special and appropriate training. Existing seminaries for boys are not to be closed at once, but then they are not to be allowed to receive any new pupils; and, if they venture to receive any, they are to be immediately shut up. The Act, in fact, recognizes that there must be priests, and that priests must learn theology; but it insists that priests shall be Germans with a German lay education, and with their minds full of German philosophy, German history, and German literature. No enactment could possibly run more counter to the whole spirit and teaching of modern Ultramontanism.

When the priest has been properly trained in this way, the time will arrive for him to be inducted into some spiritual office. His superior who proposes to appoint him must

immediately give notice of his intention to the President of the province, and a similar notice must be given if it is proposed to transfer a priest from one spiritual office to another, or if merely a temporary occupant of the office is to be appointed. Within thirty days the President may object to the appointment on the ground that the nominee has not received a proper education, and does not know philosophy, history, and literature as well as a good priest ought to know them, or that the nominee has been convicted of, or is being prosecuted for, an offence against secular law; or, lastly, on the ground that he is a dangerous person, and not inclined to render due obedience to the State. Against this injunction of the provincial President the ecclesiastical superior is permitted to appeal to a new ecclesiastical tribunal constituted by one of these Acts, the character of which tribunal is sufficiently indicated by the provision that six out of its eleven members must be ordinary lay judges. But the State has another danger to guard against besides that of the wrong man being put into the place. There is the danger lest the place should remain unfilled. The Act therefore provides that within a year from the date of the vacancy the place must be filled up. If it is not filled up, the income attached to the office is stopped, the income of the superior who ought to appoint is stopped, and the superior is subjected to a fine not exceeding one thousand thalers, which fine is to be repeated until his contumacy is vanquished. The priest himself also who ventures to take an appointment without due permission, or temporarily performs the duties of a charge which the State requires to be permanently filled, is to be liable to a fine not exceeding one hundred thalers. Further, if the priest, after having been appointed, is guilty of any serious transgression of the secular law—as, for example, if he makes himself a party to any movement which the State considers prejudicial to its interests—he is by the mere fact of his conviction rendered incapable of discharging his spiritual duties; and if he persists in acting as if he were still competent, he becomes liable to a heavy fine. All these enactments must be put together in order to see how great is the change which the position of priests in Prussia will undergo. To us who are accustomed to live among clergymen who have received the usual English education at large schools, who have then gone to an English University and taken the same degree as their friends destined for lay professions, it may seem natural and right that what we know and approve of in England should be insisted on in Prussia. It is one of the great boasts of the Church of England that its ministers are in this way brought into harmony with the laity, share the same thoughts, and are animated by the same political instincts. But the Church of Rome wishes for something totally different. It wishes for a priesthood forming a caste distinct from the laity, trained in its own peculiar way, and breathing its own peculiar spirit. In Prussia it will not have any such priesthood; and the priesthood which it gets will not only be trained in what it thinks a wrong way, but will be subjected to a supervision it abhors, and will be constantly suspected of acts which are as meritorious in the eyes of Rome as they are treasonable in the judgment of Berlin.

But the jealous watchfulness of the State is carried still further. A properly trained priest guilty of no offence against the State might still, in the exercise of his spiritual functions, be inclined to tyrannize over other priests or over laymen. Two other Acts tie him up as tight as Acts can tie him, lest he should transgress in this direction. The discipline of the Church over ecclesiastics can only be exercised by German ecclesiastical authorities. Punishment can only be inflicted after proceedings have been taken in a formal manner, after the accused has been heard, and after the grounds of condemnation have been duly recorded. No corporal punishments is to be inflicted, the delinquent can only be fined to the extent of a month's salary, and although he may be sent to a penitentiary for three months, he cannot be sent out of Germany. And his detention must be immediately notified with the most precise details to the provincial President, who can shut up any penitentiary he pleases, and can punish with a fine not exceeding a thousand thalers any attempt to establish a more rigorous discipline than the Act permits. If the delinquent thinks himself unjustly treated, he can appeal to the new ecclesiastical Court, and especial care is taken to provide that one ground of this appeal shall be that an attempt has been made to prevent his appealing. The State, too, can itself appeal, or rather can carry the case before the ecclesiastical tribunal, if it thinks that the continuance in office of a priest is dangerous to public order. The previous Act had provided that a priest convicted of an offence against public order should be deposed; but this Act goes further, and provides that a priest who is merely considered to be a dangerous person may have proceedings taken against him. His own ecclesiastical superiors are to be first invited to take upon themselves the responsibility of deposing him; but, if they decline, the authority of the tribunal is to be called into play; and if, after it pronounces against him, he presumes to discharge the duties of his office, he is liable to a fine not exceeding a hundred thalers, which is to be increased to a thousand thalers if he persists in his offence. The laity are protected by an Act which provides that no ecclesiastical punishment can be inflicted affecting their personal liberty, their property, or their civil status. Nor can any ecclesiastical punishment be inflicted if its ground is that the offender has done something which the State requires him to do, or has voted or not voted where the State permitted him a free choice. For purely spiritual offences a spiritual penalty may be inflicted; but then no public notification of its infliction may be made, and all that may be done is to announce to members of the same communion that it has been inflicted; and even then this announcement must be made in language which cannot convey any unnecessary pain to the offender. The spiritual terrors of excommunication thus remain; but every precaution is taken that, in this world at least, they shall operate in the mildest possible manner. If it is the duty of a State to protect its subjects against their spiritual pastors and masters, every one must allow that Prussia has now fulfilled this duty as it was never fulfilled before.

SPAIN.

THE opening of the second Constituent Cortes within four or five years was immediately preceded by a measure which is only important as illustrating the unreality of Parliamentary institutions in Spain. The acting Government, which had no claim to power except by accident, thought fit, without waiting for the meeting of the Cortes, to abolish by decree all ranks of nobility and titular distinctions. No grandee or nobleman can henceforth legally describe himself in formal documents by his title, although he may still with impunity be addressed as before in society. There can be no doubt that the Republican Cortes will approve a change which commends itself to the modern taste for equality, but it might have been supposed that it was unnecessary to anticipate the judgment of the supposed representatives of the people. The Spanish nobility have never within modern times exercised political power, for absolute monarchy was immediately succeeded in Spain by democratic legislation. The great families, of which some bear historic names, have subsided into obscurity, although some of them retain large possessions, and all of them look down on the modern Counts and Dukes who have earned their titles in revolutions and civil wars. The decree of the Government will cause them some annoyance, but little practical inconvenience; and, if circumstances change, it will be as inoperative as it is irregular. The hurry of the transaction shows that the Government thought that the suppression of hereditary rank would be popular, though it is difficult to understand how it could be regarded as urgent. The Ministers may or may not have justly appreciated the importance of the change; but it is clear that they have estimated at their true value the functions of the Cortes. It would have been quite as easy and as legitimate to proclaim a Federal Republic as to abolish titles; and probably they would have undertaken the establishment of a new Constitution if it had not been deemed more convenient to devolve the responsibility on the Cortes. Perhaps the Ministers themselves, though they are agreed as to the name of the future Government, may not have attached any definite meaning to the Federalism which they profess. It is incredible that statesmen, whatever may have been their former professions and prejudices, should think that the most pressing need of the country which they have governed for three months is further administrative and political subdivision. The central authority in Madrid already experiences sufficient difficulty in enforcing the obedience of local Juntas and Deputations. If the provinces of Spain were to become States in a Federation, and still more if every town and district assumed independence, it would be impossible to maintain even the limited amount of order which has survived the proclamation of the Republic. When the Monarchy was supposed to be stable and permanent FIGUERAS and CASTELAR called themselves Federal Republicans, because Federalism had casually become associated with extreme democracy. Since their accession to power they have done nothing to give effect to their professed opinions, and it is probable that the

majority of the new Cortes will approve and imitate their inaction. It will be necessary to insert some sonorous phrases in the Constitution for the satisfaction or amusement of the party which calls itself Federal; but a Constituent Assembly which affects to represent the whole population cannot consistently split up the nation into fragments. If Spain were naturally and rightfully a Federation, the Cortes would have usurped the power of legislating for States and provinces which were entitled to settle their own institutions. No precedent can be found in history for the deliberate disruption of a State by a Constituent Assembly, although the converse process of creating a national Union was successfully undertaken by the delegates of the North American States after their revolt from England.

The members of the Constituent Cortes are fully aware that they represent but a fraction of the nation. The Radical or Conservative deputies who have been elected will decline to confer on the discussions the show of validity which might be derived from the presence of an Opposition. The minority will consist, not of the party which lately ruled Spain, but of the extreme or uncompromising Republicans who affect to be dissatisfied with the moderation of the Government. It matters little whether the elections were free, when the mass of the population, including the whole of the respectable classes, abstained from taking any part in the struggle. A representative Assembly which has notoriously not been chosen by the constituencies can exercise no moral authority. The formal establishment of the Federal Republic will be universally treated as an idle form. The new Constitution will last, in the improbable contingency of its being accepted by the nation and supported by the army; but the second of two Constitutions founded on universal suffrage, and incompatible with the first, will not be entitled to respect on the ground of its origin. The first meeting of the Assembly was characterized by the unanimity which had been secured beforehand, and by the tranquillity which naturally attends general indifference. The President of the Ministry delivered a conventional harangue, and ORENSE, who lately bore the title of Marquis, was elected by a large majority to the presidency of the Cortes. In any of the three preceding Assemblies his name would have been rejected by overwhelming majorities; and there is no reason to suppose that in the interval any considerable change has taken place in the opinions or feelings of the Spanish people. The Republic, where it fails to excite alarm, is regarded with utter indifference. It is said that CASTELAR, who would have been the Ministerial leader in the Cortes, has determined to retire from the Government, and to conduct the debates on the Constitution as a private member. If the report is true, a fresh proof will have been given of the imperfect comprehension of Parliamentary institutions which prevails in Spain; but, whatever may be the intentions of CASTELAR, there will be no reason to doubt his honesty or patriotism. It is perhaps not surprising that he should be weary of the thankless task of conducting foreign relations with Powers which have with one accord declined to recognize the Provisional Government. Immediately after the proclamation of the Republic, FIGUERAS imprudently boasted of the tendency of a Republic in Spain to produce imitation abroad. The Foreign Minister has in his circulars and despatches more judiciously declared that the Republic is exclusively indigenous, and that Spaniards are as unwilling to interfere with the institutions of foreign nations as they are resolute to reject an interference which will fortunately not be attempted. An officious demagogue who undertook to convey to the Spanish Government the sympathy of the revolutionary faction in England failed to obtain an official audience of the Foreign Minister, who in a private interview confined himself to safe generalities. The courtesy and good sense of Señor CASTELAR offer a contrast to the conduct of LAMARTINE, who, during his short term of office in 1848, exchanged offensive and insincere civilities with SMITH O'BRIEN and the other cabbage-garden rebels. It is certainly true that the propagandism of the unlucky Spanish Republic is at present the reverse of formidable. A bankrupt Government, a dissolving army, and a petty civil war which the Government is unable to suppress, are not calculated to excite admiration. If the present Ministers were to retire from power, no presentable successors could be found in the Republican ranks.

The Carlist war, as usual, smoulders in the Northern provinces, without making any considerable progress. The supporters of Monarchy, who probably form a majority of the entire nation, show no disposition to accept the Duke of MADRID as their candidate for the throne instead of the son of Queen ISABELLA; but the inability of the Government to suppress the insurrection promotes the circulation of alarming rumours. Sometimes it is said that the commander of the Republican forces has made terms with Don CARLOS; or the details of a fusion of interests among the rival Pretenders are invented and generally repeated. The troops at the disposal of the Government are harassed and diminished in numbers by the petty and inglorious warfare with the Carlists; and there seems to be little foundation for the statement of FIGUERAS to the Cortes that the discipline of the army is restored. The late change of policy and of government in France is naturally discouraging to the Republicans; but it is possible that it may facilitate the resistance of the Ministers to the agitation of the revolutionary faction. If the Republic is without further disturbance formally established by the Cortes, the Government which has hitherto been only provisional will be recognized by England, and perhaps by Germany and Italy. It is highly improbable that the French PRESIDENT, or the majority in the Assembly to which he owes his office, will favour in any way the Spanish Republic. The Legitimists, in consistency with their principles, maintain the claims of Don CARLOS; and a Federal Republic which is supposed to involve the doctrines of the Paris Commune is obnoxious to all fractions of the Conservative party. The license which has been accorded to the Spanish army is especially repugnant to the feelings of all moderate Frenchmen.

The most definite and most serious of the Ministerial pledges is contained in the announcement of FIGUERAS that the Government has resolved on the abolition of slavery in Cuba. The Cortes will support a policy which has always been advocated by the Republicans; but a Bill for the emancipation of the slaves will probably at once detach the colony from its allegiance. The only party in Cuba which clings to the connexion with the mother-country consists of the colonists of Spanish birth who are most deeply interested in the maintenance of slavery. If the institution is abolished, they will be deprived of their fortunes, and in many cases of their means of livelihood, and they will estimate at its real value any amount of pecuniary compensation which may be nominally provided. The bankrupt Spanish Treasury will assuredly not suffice to meet the charge which would be imposed in any equitable settlement. Finance Ministers who one after another create an equilibrium by withholding interest on the existing debt will not make any distinction in favour of slaveholders. It is even doubtful whether a Republican Cortes will vote compensation for a kind of property which may be plausibly denounced as intrinsically wrongful; but it matters little to the proprietors of Cuba whether a promise of payment is in the first instance refused or finally broken. It will be difficult or impossible to resist the effect of Spanish legislation; for the dominant party in Cuba depends chiefly on the support of the army, and the American Government would not recognize the independence of the island except on the condition that slavery was abolished. The task of the Government and the Constituent Cortes is neither easy nor enviable.

THE DECLINE OF BUNKUM.

IT is evident that the House of Commons has now pretty well worked off the yeasty inflation with which it began its career, and is settling down in its last hours into something like sobriety and common sense. Partly this may perhaps be natural to its moribund condition; but though the House expires, many members hope to find a place in the new one, and it is significant that, as candidates once more, they are shaking themselves free from the influences of that fit of fanatical unrest and feverish disturbance which set in with the last general election. One of the healthiest symptoms of the Session has been the way in which all sorts of screechy, crotchety, sensational, topsy-turvy projects have gone down with a run. Some have been snuffed out offhand, while others have only just been saved by languid and declining majorities in the House of Commons, for the sake of throwing the responsibility of extinguishing them on the Lords. A bad time has come for the MIALLS and LAWSONS, the AUBERON HERBERTS and Citizen DILKES, for the priggish brotherhood and shrieking sisterhood, and generally for sentimental fury and imbecile impulsiveness. The House of Commons has shown after all what Dr. JOHNSON would have called a bottom of good sense, but the conditions under which it was originally got together were certainly against it. The Parliament which it had to replace was supposed to be tainted with Palmerstonian traditions of worldly wisdom and prudent let-alone. But now there was to be no more world-

liness, or expediency, or making things pleasant. What was wanted was an earnest Parliament. Mr. GLADSTONE was the new leader, and Mr. GLADSTONE was an earnest man. If there was not much else to be said of him with certainty, this at least might be said; he was warranted to be always in earnest, and just as earnest on one side as on the other, and it was thought necessary that he should be kept in countenance by an earnest House of Commons. It is curious to observe how qualities are sometimes worshipped on their own account, irrespectively of the uses to which they are applied. Whether earnestness is a good thing or a bad thing must depend, one would think, in some degree on the purposes to which it is directed. An earnest man with a mischievous purpose is all the more a nuisance in proportion to his earnestness, and on the whole it would be better perhaps that he should not be earnest. Earnestness, however, had acquired a cant sense of its own. It carried with it a strong flavour of spasmodic fervour and emotional goodness, combined with a rigid determination to be always dreadfully serious and on high stilts, and never to laugh on any provocation, or to allow anybody else to do so. An earnest man might be trusted never to tie his neckcloth or to help himself to salt except for the good of the whole human race, and with a precious sense of responsibility for the possible consequences of his act to generations yet unborn. The earnest man was the peculiar contribution of the general election to the collective wisdom. He was in a minority, of course, but he leavened the mass. He awed his frivolous and light-minded companions by his solemn assurance, or at least bored them into submission by his dismal pertinacity. Of course every earnest man felt bound to take a front seat, and to assume the leadership of his party on some question or other. But all this earnestness, associated as it was with fussy self-importance, ignorant dogmatism, and rude and blatant intolerance, was rather too much for poor human nature; and it was evident that some day a revolt would happen. It has come at last, and the earnest man is driven to the wall. The wonder is, not that the House should at last have turned upon him, but that it should have tolerated him so long.

There can be no doubt that the impulse to resistance came to the House of Commons from without. Members had at first been imposed upon by the loud confidence and self-assertion of the earnest brotherhood, and fancied that they must surely represent a considerable body of public opinion. There was therefore a disposition to deal gently with them, and even to see how far, with an eye to the constituencies, it might be possible to keep company with them. Recent elections have disclosed the hollowness of the delusion, and warned members that it would tell rather against than for them with their constituents if they were suspected of sympathy with any of this fanatical meddlesomeness. Now that the bogies which formerly looked so formidable are seen to be what they really are, they are soon swept aside. A dummy Bill and a bundle of manufactured petitions form the Parliamentary counterpart of the scooped turnip and white sheet of mischief-making rustics, but in each case a noisy chorus is an important part of the performance. Once, perhaps, public meetings and petitions may have been a trustworthy indication of genuine public opinion. But the processes of factitious agitation have now been reduced to a science, and they provide regular employment for a large body of enterprising and not too scrupulous experts. You have only to give your orders to a professional agent, and he will conjure up an agitation on any subject at a minute's notice. He will provide you with petitions by the mile and signatures by the million. All that is wanted for a meeting is a hall, a chairman, half-a-dozen speakers, and a bundle of cut-and-dry resolutions, and all these the professional agent has at command. The agent knows, too, how to turn the newspapers to account, and of course if the movement is of any importance, it will have an organ of its own. The "kept press" is one of the institutions of the day. In short, nothing is easier than to get up all the apparatus of agitation whenever it is required, and at a very moderate cost. Often the thing is managed so smartly that even those in the secret are half deceived by specious appearances of public interest and excitement. Let anybody read the list of petitions which are daily tumbled by the ton into the mysterious blue-bags at the Clerks' table in the House of Commons, and observe how little connexion there is between all this parade of opinion and the actual opinions of people in real life. You might imagine from the number of petitions on certain subjects that the whole country was in a ferment about them, and that in big towns and little towns, and even far away in secluded regions, on the hill-side or by the shore, wherever two or three were gathered together, nothing else was thought of or talked about. And yet, in point of fact, you might go through the land without ever really hearing a whisper of any of those thrilling questions or meeting anybody who cared twopence about them. The Deceased Wife's Sister claptrap shows what can be done with the help of a brass plate, an anonymous subscription-list, a staff of petition-touters, and unbounded impudence.

It is only the timidity of members that gives these bogies a chance. If members would only face them boldly at the outset, they would very soon discover what hollow shams they are. Nothing can be more discreditable to the courage and common sense of members of Parliament than the weak, pusillanimous way in which they have for some years been trifling with such questions as the Contagious Diseases Acts and the Permissive Bill. If they had only put down their feet boldly at the outset, they would have spared themselves a great deal of needless worry, anxiety, and humiliation, and would at this hour stand much higher in the opinion of their constituents. The fanatics and agitators are keen, noisy, and blustering; but, after all, they are only a poor minority of the nation, and in the long run it is safer to appeal to the good sense and intelligence of the great body of the people. It is impossible for constituents to have any respect for a man who submits to the degrading tyranny and dictation of a small fanatical clique. The crotchet-mongers know neither moderation nor gratitude; and there is no choice but to be their slave or their enemy. And this is what members have lately had brought home to them. They have discovered that they have been altogether under a delusion in fancying that any of these extreme sensational sects really represented a solid body of opinion, and that they were making their seats safe by doing kotou to them. In reality, they have been dropping the bone for the sake of the shadow. This would seem to be the explanation of the rush that has lately been made at all sorts of crotchety, hysterical proposals. Members see the necessity of putting themselves right with the common sense of the country, and there is also perhaps a spice of personal revenge for past humiliations in their onslaught on the bogies that used to frighten them.

LORD DERBY AT PRESTON.

NO more appropriate tribute could have been paid to the late Lord DERBY than the erection of a statue in the Preston Park. If there is any part of the world in which he would have liked to be remembered after death it is Lancashire, and the crowd of Lancashire men and women which assembled to do honour to him on Tuesday was just the crowd which it would have given him most pleasure to see round him in his lifetime. Colonel WILSON PATTEN was able to fill a large part of his speech at the unveiling of the statue with instances of Lord DERBY's affection for everything in or about Lancashire. He passed the greater part of his life in the county; he found it hard to see a fault in the Lancashire character; even the roughness of language and manners which strangers are apt to think unattractive was dear to him as the outward husk of honest and straightforward purpose. It was not only in barren admiration that his attachment to Lancashire showed itself. Whenever his money or his voice was needed in the service of his native county it was always freely given. In the greatest crisis of Lancashire affairs, the cotton famine, he took a foremost part in working the vast distributive organization which that calamity called into existence. He was, in short, as his son truly said, in all things and before all things a Lancashire man. This half of Colonel WILSON PATTEN's work offered no difficulties to a speaker who knew his facts. It was hardly enough, however, at a meeting of this kind to dwell only on the local interest of the theme. The late leader of the Conservative party was something more than a county magnate. He was, says Colonel WILSON PATTEN, during the whole course of his life a public man as well as a Lancashire man. He entered Parliament early, he soon became known as a politician, and throughout his life he exercised a very powerful influence on all public measures. It is not wonderful that at this point the speaker should have become suddenly impressed with the importance of confining himself to statements with which men of all politics should be able to agree. Lord DERBY was a popular and powerful Parliamentary leader, but in the character of a statesman who leaves his mark on the legislation of the country there is not much to be said about him. The most important measures which he was enabled to pass are not such as the party with which his name was associated for the greater part of his career can have much sympathy. His followers are now trying to

upset the system of education which he founded in Ireland, because they think it too favourable to Roman Catholicism; and though they accepted the Reform Bill as a necessary sacrifice to Conservative strategy, it was with heavy hearts and many forebodings. A long and vigorous life, during much of which he was the undisputed leader of his party, has left no lasting trace behind it. There is scarcely a single Liberal statesman of any mark of whom something more than this could not be said. This is the main difference between the two parties which have alternately guided English politics for so many years past. On both sides there has been talent, genius, oratory, patriotism. On one side only have there been results. The rule might be proved, if it were necessary, by one conspicuous exception. By a curious coincidence a statue of another Conservative statesman was being unveiled on the same day at Huddersfield. There was no need in praising Sir ROBERT PEEL to travel beyond the one great act of his life. His private and local virtues are dwarfed by his fame as the man who repealed the Corn Laws. But, in passing from the region of words to the region of deeds, he had to break with the party he had so long led. When he elected to be judged by the solid fruit of his legislation, he ceased to be ranked among Conservatives.

The present Lord DERBY had a double claim to be listened to at Preston. He is the son, and in some sort the successor, of the statesman in whose honour the statue had been set up, and he is himself the most perfect representative of that new Conservatism which promises to supersede the more boisterous and aggressive variety exemplified in his father. Mr. BRADLAUGH'S denunciation of the House of Lords would have been scarcely less congenial to the late Lord DERBY'S taste than his son's defence of it. "I have heard," says the present earl, "many things said, and seen many things written—very plau-"sibly and not without force—against the existing constitu-"tion of the House of Lords. . . . But when you come "to ask those who criticize us what they mean to put in our "place, you do not as a rule get very clear and coherent "answers." A Senate composed of men who have discharged important public duties "would become a refuge for disap-"pointed politicians and superannuated officials." An elective Second Chamber would be only a weaker and inferior rival to the House of Commons. To do without a Second Chamber is an experiment which has been tried on various occasions in Europe, but "somehow the experiment has never "lasted very long or ended very successfully." It would be difficult, perhaps, to construct a better defence of the House of Lords than this. There is no strength wasted in resisting attack; the assailant is allowed to construct his own plan of campaign, and then paralyzed by the inquiry how he proposes to use his victory. It is quite true that the main argument against altering the constitution of the House of Lords is the difficulty of constructing it on a new pattern. As it is, it is a reality, and, with the single exception of the United States Senate, which would not admit of being reproduced in England, it would be difficult to point to any other Second Chamber that is a reality. Yet this mode of defending institutions, telling as in some respects it is, is open to two defects. One is that it makes it very difficult to introduce any change into them, even in points where change is obviously needed. Lord DERBY'S argument comes to this: The House of Lords is a happy accident. Nobody can say why it works well when other Second Chambers work ill; all we can say is that it does work well. Its merits are obvious, but they are incapable of being resolved into their constituent elements; they defy analysis, though they are perfectly visible in action. But in an institution of this kind there is no means of distinguishing between the essential and the non-essential parts. The House of Lords is a composite fact, and who shall presume to say in what part of it resides the invaluable quality which makes it what it is? We know that proxies were abolished without the House of Lords sustaining any injury; but before this change was made it would have been open to any one to maintain that it was the accidental right of voting without being present that marked off the House of Lords from Assemblies in which no such practice was known. The same thing may now be said of life peerages. It may be thought that a system which would bring new blood into the House of Lords under less burdensome conditions than the process now entails upon men of moderate means would be a source of increased strength. But then, if all we know is that the observance of the hereditary principle has somehow saved the House of Lords from the degradation which has overtaken other Second Chambers, it becomes a dangerous thing to meddle with it. A Second Chamber composed of hereditary members has, on the whole, been a success. Second Chambers composed of members appointed for life have, on the whole, been failures. Who is to decide whether a great deal of the hereditary element, mixed with a very little of the life element, would work as well as the hereditary element has worked when altogether without alloy, or whether a fractional addition of the life element would by degrees leaven the whole hereditary element, and make it as useless as in other countries it has itself proved to be?

The other objection to Lord DERBY'S mode of defending existing institutions is that it seems to prove too much. It is impossible to create an English House of Lords outside England, since other countries have not the materials or the traditions out of which this anomalous body can be constructed; it is no use, for the reasons given by Lord DERBY, trying to construct a Second Chamber on any other model; it is no use trying to do without a Second Chamber altogether, for other countries have tried that experiment and failed in it. Then what are other countries to do? Nature can hardly have intended that England should be the one country in Europe in which the blessings of settled government should be enjoyed; and yet if a Second Chamber is elsewhere unattainable, while without it political existence is unendurable, nature has somehow been betrayed into doing something very like this. Again, Lord DERBY'S reasoning is conclusive so long as facts bear out his assumptions. But the conspicuous political success of any other experiment would deprive it of all its force. If France, for example, gets hold of an Elective Second Chamber which is found to work well, or if she decides upon doing without a Second Chamber and finds no cause to regret her boldness, Lord DERBY would apparently have nothing to oppose to the things which he has heard and read against the House of Lords. And as everything said against the House of Lords applies with at least equal force to the Monarchy, there seems no security, except in the continued misfortunes of our neighbours, that Lord DERBY may not end by becoming a Republican.

THE JUDICATURE BILL.

THERE seems after all but little difference of opinion on the important questions of principle which have been raised upon the Judicature Bill. The correspondence and articles which have appeared in the *Times* and elsewhere in the course of the last week have disclosed an amount of agreement which is quite surprising. Disputants writing from different points of view have taken exception to each other's arguments, and criticized each other's language, but on all broad questions of principle they appear substantially at one.

There seems to be a common understanding that the Equity Courts need more strength to enable them, first, to adopt the Common Law practice of relying mainly on *viva voce* evidence; secondly, to withdraw from Chief Clerks so much of their work as ought to be done by Judges; and, thirdly, to rescue the judicial business of the Court of Bankruptcy from the hands of Registrars, and bring it back to the Chief Judge. It appears to be equally agreed that at least one Judge versed in Equity ought to be associated with every Common Law Division.

The precise mode in which these amendments should be worked out, and the extent to which they should go, are of course open for discussion, and it is manifest that a matter of this kind cannot be effectually disposed of in Committee of the whole House. Another almost stronger reason for referring the Bill to a Select Committee is afforded by the terms of the schedule which purports to lay the foundation, at any rate, of the future practice of all the Courts. It contains various regulations as to pleading, but they are so vague and inconsistent as to leave it quite uncertain whether the leading principle of Equity or of Common Law pleading is to be adopted. If the schedule is to operate at all, it must at any rate decide between two radically inconsistent principles.

The Common Law theory of pleading is that each party states his view of the legal effect of the facts, but does not particularise the facts themselves; and a number of rather complex rules are added to ensure that the pleadings so framed shall automatically lead to precise and definite issues of fact or law. Equity has an analogous system of pleas, but it also has a substituted proceeding by bill and answer, instead of bill and plea, the theory of which is that each party states the facts on which he relies as distinguished from their legal effect. In

about one case in a thousand the procedure by plea is adopted. In all the rest the open pleading, as it is called, by answer is found preferable in practice. Broadly the difference between the two systems is this:—At Common Law each party says, "Some-"thing has occurred, the particulars of which I do not men-"tion, which amounts to a contract to such and such effect, or "gives me certain rights, or relieves me from certain obliga-"tions. When we come to trial, and not before, you will hear "from my witnesses what the precise facts are on which my "claim is founded." In Equity each party says, "Certain "specific facts occurred, the particulars of which I hereby "state, and when we come to the hearing I shall claim such "and such rights, or any other rights to which the Court may "consider me to be entitled under the circumstances."

The Judicature Commission decided as between these two methods that open pleading was the better; but, without discussing the matter at all, it is clear, on any view, that the two theories are thoroughly conflicting, and that the new practice must be based on one or the other. This was the first point which should have been determined by the schedule, and yet, strangely enough, it is left absolutely undecided. There are provisions that seem to point to open pleadings, and other provisions which are intelligible only in connexion with pleadings directed to specific issues. This ambiguity will require to be cleared up; and, whichever view is adopted, a multitude of alterations will be needed to make the schedule consistent and workable. A task such as this can only be performed by a Select Committee. Should the motion for such a Committee be carried, as we presume it must be, it will become useful to dwell upon details which at present it might be thought premature to discuss.

THE JESUITS.

THE old controversy about the Jesuits—for it is, in fact, as old as the existence of the Order—has again come prominently to the surface in two of the leading States of Europe, Germany and Italy. Prince Bismarck, who is a man of deeds rather than words, has shown his decision, if not his discretion, by expelling them from Germany. The Italian Parliament, which is credited by friendly critics with a character precisely the reverse of that commonly attributed to the English monarch "who never said a foolish thing and never did a wise one," has been content with less stringent measures, but has indemnified itself with a rhetorical *tour de force* of two days' duration which would leave Mr. Whalley nothing to desire. "The warmth and passion and almost frenzy" displayed by many of the speakers are reported as almost incredible, and it was urged that no quarter ought to be allowed to the Jesuits, who should be arrested and banished wherever they are found. On the other hand, there were deputies who argued that they are too contemptible to be worth serious notice, and might safely be left to blink and flutter as best they can like owls in the clear sunshine of a regenerated Italy. It would of course carry us far beyond our present limits to enter on a general examination of the history and policy of the institute of Ignatius Loyola, and the merits or demerits of the ethical system which is its distinguishing characteristic. But, at a time when recent events have invested this subject with a fresh and practical interest, and when, it may be added, the wildest nonsense is being talked about it in other places besides the Italian Parliament, it will not be out of place to inquire briefly into the reason or unreason of the various popular estimates which have been formed of the Order, and the startling phenomenon of the intense detestation it has always kindled in a large section of the adherents as well as of the enemies of the Roman Catholic Church, as was exemplified at the Old Catholic Congress last year. That very hatred is indeed, in the eyes of the Jesuits themselves and their admirers, one of the strongest arguments in their favour. It was the prayer of their illustrious founder that, like Him whose name they bear, they might be hated of all men, and they are never tired of proudly reminding us how abundantly that prayer has been fulfilled.

Putting aside this view of the matter, which is too obvious to need any explanation, the current opinions about the Order may be summed up under three heads. In the first place, there is the alarmist or fanatical view, which found such vehement expression the other day in the Italian Parliament, and with which we in Protestant England are sufficiently familiar both in society and in novels like *Hawkestone* or *Father Petre*. According to this theory, Jesuitism is a gigantic conspiracy against the eternal and temporal welfare of mankind, carried on with diabolical skill, and plying its nefarious arts with a preternatural success. Its leading principle is that the one end, which is the attainment of its own supremacy, is to be pursued at all costs by fair means or foul, and its ministers are bound by a solemn oath to subordinate the will of God to the commands of their human superior. According to these fierce alarmists—and, strange to say, there are some men of education and intellect among them—the Jesuits are really at the bottom of every event, great or small, that has the remotest bearing on religion. The destruction of the Irish Establishment, for instance, was brought about by their secret machinations, though Ireland is probably, of all Roman Catholic countries in Europe, the one where they have least influence, and the Irish Church Act would tend rather to diminish than to increase it. They are always turning up in the strangest disguises and the most unexpected places. They are seen at work among hodmen and bricklayers, they misreport Parliamentary speeches for the daily papers, they covertly undermine Protestant belief from Anglican pulpits, they creep into Protestant families, and the cunning leer of "the female Jesuit" may be detected by a practised eye in the simper of an innocent looking scullery-maid. This is one view, widely prevalent among Protestants, and not wholly unknown among Roman Catholics, nor have we given a single illustration which has not been seriously and frequently insisted upon as certain fact. Then, again, there is the extreme view on the opposite side, which is also not an uncommon one, especially among modern Liberals, and has at least the advantage of being less conspicuously absurd, according to which the Jesuits are much like any other Order in the Church of Rome, neither better nor worse. They happen indeed to have got a bad name, which they only deserve in so far as they are zealous champions of Romanism, and Romanism is a retrograde religion. They may have gained a factitious importance in former days through the aid of despotic Governments, but that period has passed away, and in themselves they have as little power and as little interest for the outside world as the Benedictines or the Lazarists, and can only become important by being persecuted. As a rule, members of the Order are men of very mediocre ability, and there are few great names to be found among them. Midway between these two extreme views, but inclining more to the first than the last, comes to all appearance Prince Bismarck's estimate of what he sees to be a highly organized and ambitious corporation, and perhaps regards as based on a deliberate imposture. He is aware that it has been often in conflict with bishops, and sometimes disliked by Popes, and thinks that by striking a decisive blow he can annihilate its influence in Catholic Germany once for all. In this view also there is a certain admixture of truth, but experience will probably show that it is far from being the whole truth.

We shall hardly be expected to argue gravely against an hypothesis which assigns to the Jesuits a position corresponding to that of the Genii in the *Arabian Nights*, only that Satan, instead of Solomon, is their lord and master, and the preternatural gifts wherewith he endows them are used invariably for evil. Yet there must be something to account for the extraordinary hatred, wholly unparalleled in any other institution or order in the Roman Catholic Church, which they have drawn on themselves from the very first. Within a few years of their establishment, Sixtus V., the ablest Pope of the sixteenth century, could hardly be dissuaded from suppressing them, and the abolition of the Order was extorted from his not unwilling successor, Clement XIV., two centuries later, by the unanimous demand of all the Catholic Governments of Europe. They had, in fact, already been expelled from almost every Roman Catholic country. Now the theory which refuses to recognize any fundamental difference between the Jesuits and other religious communities in the Church will not account for this, as neither will it account for the enormous influence which they have exercised, and exercise still, over the civil and ecclesiastical policy of the See of Rome. And it must be remembered, too, that it is precisely in those countries where they are best known that they are most deeply hated. So far as they have any home or national character, they are Spaniards, and Charles III. of Spain was mainly instrumental in bringing about the league of Catholic sovereigns which led to their suppression in 1773. Through their close connexion with the Popes, they have always been most powerful in Italy, where they have had the entire higher education of the country in their hands since their restoration in 1814. And it is in Italy, and by their own former pupils, that they are now most passionately denounced. Indeed it has become so notorious as almost to have passed into a proverb on the Continent, that the *alumni* of Jesuit colleges, unless they enter the Order, become its bitterest enemies. It is true again that, although they have had some men of mark to show, chiefly in the earlier period of their history, such as Petavius, Suarez, and Bellarmine, the average standard of learning and ability among them has not been a high one; and there is something almost ludicrous in their utter intellectual collapse before the impetuous assault of Pascal, while for original genius the Order has never found a home. It was inconceivable that men like Lacordaire or Newman should join its ranks; it was inevitable that Passaglia should desert them. But this only makes the vast educational influence wielded by the Jesuits for two centuries, and in a lesser degree down to our own day, a more remarkable phenomenon. It may be a calumny to credit them with the shocking doctrine that the end justifies the means; but their marvellous temporary success is a fact that lies on the surface of history. There is manifest absurdity in charging them with habitually plotting against the welfare and happiness of mankind; but why does mankind so vehemently and persistently detest them? It must surely be allowed that these are phenomena which demand an explanation, and that none of the theories already referred to adequately supply it. Neither, of course, can we pretend in the short space remaining to us to do more than glance very briefly at the salient points of the question, which, however, are not very far to seek for those who look a little deeper than the empty commonplaces of religious partisanship or theological rancour.

In the first place, then, it is perfectly true that the Jesuit Society differs fundamentally from every other monastic order in the Roman Catholic Church, mediæval or modern, though in form it closely resembles them. And that, not because to the three ordinary vows of poverty, chastity, and obedience, it superadds—as, we believe, do some later communities—a fourth vow of obedience to the Pope, nor even because the rule prescribes a more absolute and *ex animo* submission to the will of superiors. The secret of its strength, as also, in one sense, of its weakness, lies neither in the vow nor the rule as such, but in two things which it owes to the peculiar temperament and consummate ability of its founder—its organization and its spirit. There are few more characteristic observations in De Maistre's *Soirées* than this:—"Rien ne s'accorde dans ce monde comme l'esprit religieux et l'esprit militaire." Ignatius Loyola was of the same opinion, and his order, unlike all that had preceded it, was organized on a rigid military system of discipline. Its constitution was not to be, like those earlier monastic systems which Montalembert has so eloquently eulogized, republican, but despotic. Its General, elected by a close oligarchy, rules for life, and all power is derived from above and not from below. And such as its constitution is its spirit. Obedience means to a Jesuit the annihilation of individuality, not only in action but in thought, and that not so much for the attainment of his own personal perfection—for the Contemplative Orders are held to represent the highest form of the religious life—as with the practical aim of providing an admirably drilled spiritual army, every regiment and every soldier of which shall be ready at a moment's notice to carry out with unquestioning docility the commands of the General or the Pope. The last words are almost tautology. From the first the Jesuits were designed to be the Prætorians of the Papacy, and they have discharged the office with unswerving loyalty, except indeed that, like the Prætorians of old, they have frequently usurped the functions of the despotism they so jealously maintained. The Black Pope and the White are seldom at open war; but, when they differ, the former has usually proved the stronger of the two. Pius IX. was known at the beginning of his reign to have little affection for the Jesuits, but for the last twenty-four years they have completely ruled him. And thus the secret of their power is also the secret of their unpopularity, even in their own communion. They have virtually ruled the Roman Catholic Church for three centuries past, and have ruled it with a rod of iron. Their power was originally attained by the perfectly legitimate means of that superior culture and organization which speedily placed them at the head of the education of Catholic Europe, and in countries of mixed religion drew multitudes of Protestant children to their schools. And it is only fair to add that they owe its maintenance in great part to their comparative freedom from the moral corruption which has sooner or later overtaken almost every other religious order in the Church. Scandals there have been, and very grave ones, in Jesuit communities, especially in some of their colleges for boys in Austria; but these have, on the whole, been rare exceptions. The rigid system of espionage which makes every Jesuit, by the rule of his order, a perpetual spy on his brethren, odious as it may justly appear to our English notions, can hardly fail to act as a powerful moral check.

But the immense influence of the Jesuits has not been gained exclusively by intellectual or moral methods, and it has been used in a way sure to provoke the deadliest antagonism. They have all along made it their particular business to act upon the ruling classes of society, and from the beginning they aspired, as royal confessors, to shape the State policy of Europe for their own ambitious ends. They were mixed up with the numerous plots against Queen Elizabeth, and through the long reign of Louis XIV. they governed the French Church through the King's mistresses, and filled all its sees with their nominees. And it is a curious circumstance that throughout that period they did not scruple to secure their position at Court by professing Gallican opinions; they actually had a hand in drawing up the Declaration of Gallican Liberties, and as late as 1762 they offered to teach the famous Four Propositions if allowed to remain in France. They persistently meddled, eventually to their own hurt, with the politics of Spain, of Austria, and of Poland, and even in our own day the Swiss war of the Sonderbund was their work. There is truth in the statement, though it occurs in a somewhat highly-coloured diatribe against the order, that, if the Jesuit first lays his hand on education, "he comes in time to the polls, the legislature, the judiciary, the executive." He would probably reply that he is fully justified in doing so. But then it must be remembered that the power thus acquired has generally, and no doubt quite conscientiously, been used in the interests of civil and ecclesiastical despotism, which are consecrated in the Syllabus, itself a Jesuit production, and elaborately defended in the works of Jesuit theologians like Schrader and Schneemann, and in the *Civiltà Cattolica*, the acknowledged organ of the Society. In strict accordance with these aims, their method of education, as was implied just now, has always tended to the discouragement of originality of character or thought, and its natural result is to train men to argue from their brief. Their ambitious temper and despotic ideal of Church government necessarily make them intolerant of episcopal authority, which represents the aristocratic as distinct from the monarchical principle, and the normal attitude of the episcopate towards the order is that of an armed neutrality. Prince Bismarck has done his best to promote a closer alliance between them in Germany, just as the kindred though far feebler policy of the Ecclesiastical Titles Act helped to rally all Roman Catholic parties in England under the banners of Ultramontanism. But we are bound to add that, while the unpopularity of the Jesuits is due in great measure to causes inseparable from the very idea of their institute, and coeval with it, they have only themselves to thank for converting unpopularity into personal hatred by conduct no longer excusable on the plea of conscientious, however mistaken, devotion to a great end. While aspiring to control the destiny of empires, they are not ashamed to stoop to a pettiness of narrow jealousy and almost feminine spite which gives point to the bitter Italian proverb that a priest never forgives. It was a notable example of this when they constrained Pius IX. to commit—we may well hope reluctantly—one of the unworthiest acts of his pontificate, for which there was absolutely no precedent in the annals of the Papacy. Rosmini, the pious founder of the Order of Charity, and by far the most distinguished man among the Italian clergy of the present century, was not only a Cardinal *in petto*, but his intended promotion on the next occasion had been formally notified to him by letter from the Pope. Yet the Jesuits, who disliked both him and his new order, compelled the Pope to annul the appointment, and to place Rosmini's best known work, originally published at his own express desire, the *Cinque Piaghi della Santa Chiesa*, on the Index. Those who habitually adopt such methods of action—and this is no isolated case—may be feared, but cannot wonder that they are not loved.

It would be impossible, even if we felt disposed to enter on the perilous task of prediction, to discuss here the possible future of this strange and unique community, either in the world generally or in England. But it may be worth while to bear in mind that, while the Jesuits are *par excellence* an "international" society, like the Church to which they belong, they cannot so far escape the ordinary conditions of humanity as not to take some colouring from the circumstances and tone of thought of the various countries in which they find themselves. After full allowance for the common features which so markedly distinguish them everywhere, there is still some difference, as a rule, between an Italian, a French, and an English Jesuit, and the first and third are probably the most dissimilar. In England, as elsewhere, the Jesuits monopolize the fashionable churches and the fashionable education of their co-religionists. Stonyhurst is spoken of as "the Catholic Eton." But the elements in their teaching which have made it so obnoxious elsewhere are largely modified here, and their attitude on public and even on theological questions is said to be different from that of their Italian brethren. Whether or not this is due to the ampler toleration allowed them, there can at least be no doubt in our day that the only way to make the order formidable is to be afraid of it; and that its influence is inevitably increased by attacks which make it a matter both of honour and of interest for Roman Catholics of all classes to throw themselves on the side of the persecuted champions of their faith. A new Ganganelli may arise to suppress the order more effectually than his predecessor, or it may at last die a natural death in the growingly uncongenial atmosphere of modern thought within, as well as without, the Church. But experience proves that mere brute force serves rather to consolidate than to extinguish it. Meanwhile it is rather curious, for several reasons, that in the carefully drawn sketch of English Catholicism published in last Wednesday's *Daily Telegraph*, "with the sanction"—and, if internal evidence may be trusted, from the pen—"of Archbishop Manning," the Jesuits are not once named. The omission is the more significant, first, because of the very prominent part, for good or for evil, which they have played in the history of the Anglo-Roman communion from the Reformation downwards; and, secondly, because they only the other day laid, with much ceremony, the first stone of their new establishment at Oxford, from which Dr. Newman has all along been excluded with jealous pertinacity by the authorities of his adopted Church. On that occasion the Archbishop was conspicuous by his absence.

ARCTIC DISCOVERY.

THERE have been few more curious episodes in the history of Arctic discovery than that which has been revealed by the fugitives from the *Polaris*. The story which has reached us is indeed necessarily defective upon certain important points. Until the *Polaris* arrives and Captain Hall's papers have been examined, we shall not receive a satisfactory answer to certain questions which must occur to everybody. Meanwhile, taking the facts as far as they are known, we may inquire what light they throw upon the conditions and prospects of Arctic discovery, and especially how far they justify the inference that Governments ought not to encourage enterprises which involve such serious dangers. What is known of the *Polaris* expedition may be very easily summarized. The *Polaris*, leaving the United States in 1871, reached Cape Constitution, the furthest point attained by the members of Kane's daring expedition. The open sea which was then seen beyond the Cape turned out to be a broad channel called Polaris Bay, from seventy to eighty miles in length, and from fifty to sixty in breadth. At the further end it contracts into a narrower channel, to which was given the name of Robeson's Straits. The *Polaris* entered this channel, but did not reach its northern end. Whether it opens into

the Polar Sea, or whether it again contracts, is at present uncertain; for here the expedition came to a stop. The crew, as we are told, were anxious to proceed further; they had already, without serious difficulty, reached a higher latitude than had ever before been attained by a ship; and it is possible that a little more daring might have been rewarded by most interesting discoveries. Whether his decision was dictated by prudence, or by an undue fear of responsibility, Captain Hall fell back to winter quarters in Polaris Bay, and soon afterwards died. In the summer of 1872 the *Polaris* began her retreat, as soon as the sea was open, and, becoming again beset in the following October, the strange adventure happened to which we owe our knowledge of the preceding facts. The ship, we are told, appeared to be going to pieces owing to the severe pressure of the ice. Whilst the crew were transferring themselves to a floe, the ice broke up and the ship righted. Nineteen of the crew, including a baby at the breast and two infants, were on the ice. They remained in sight of the ship all next day; but, to their astonishment, she steamed into a bay at some distance, and apparently prepared to go into winter quarters, leaving them to their fate. For more than six months they drifted southwards on the floe, and suffered severe hardships. They had to eat tanned sealskin. They were only saved from actual starvation by luckily meeting a bear at the critical moment; and, finally, as their little island broke up, had to betake themselves to a very small and rickety boat. At last, after drifting over one thousand four hundred miles, they were picked up by a whaler, and returned, baby and all, to tell their strange story.

We are told that this adventure "offers a new testimony to the immeasurable perils of an Arctic expedition." That an Arctic expedition involves certain perils is not doubtful. If it were not a rather dangerous amusement, it is probable that we should be by this time as familiar with the North Pole as we are with the Equator. Both ships and lives have been lost in attempts to penetrate the frozen parts of our planet, and it is not impossible that they may be lost again. The whole question turns upon the degree, and not the bare existence, of the dangers. Are they in any fair sense to be called "immeasurable"? The experience of the *Polaris* appears to us to prove that they are measurable by a very definite standard. If the whole crew had remained on board the *Polaris*, or had been picked up by her after the separation, there seems every reason to suppose that the entire expedition would have reached a very high latitude, and have returned without any serious loss. The question is therefore whether this singular separation was such an accident as no reasonable precautions could have rendered impossible. Till we hear the account given by the crew left on board the *Polaris*, we have not sufficient materials for forming a judgment. The story, as we have it, seems to suggest unaccountable misconduct somewhere. The party on the ice, we are assured, was in full view of the party on the ship for a whole day, and yet no attempt was made at a rescue. The "Arctic Officer" who writes to the *Times* says that the crew were under no kind of discipline beyond that common on American merchant ships. The singular facility with which the two fractions of the crew drifted apart certainly seems to suggest that there was somewhere a want of sufficient executive power. Even if a completely satisfactory account can be given of this strange mishap, it is clear that the chances of such a misfortune would have been greatly diminished had there been a stronger and better supplied force. If, for example, there had been two ships instead of one, the catastrophe could hardly have taken place under the circumstances described. The only excuse offered for the conduct of the officer in command of the *Polaris* is that she had been so severely strained that he was afraid to steam out to the floe, or that he assumed that the party on the ice could easily reach the shore. In the last case, he certainly showed great carelessness; and if there had been a companion ship, she would in all probability have been able to give the necessary assistance. The most reasonable inference at present seems to be, not that all Arctic expeditions are exposed to "immeasurable" dangers, but that a small, ill-provided, and imperfectly disciplined expedition is exposed to very serious dangers. The measure of the danger is the amount of forethought and preparation which is necessary to put any recurrence of it out of the question; and, so far as we can see, another such accident could scarcely have had the same consequences in any such expedition as would be sent out by an English Government. We should hardly venture to draw the further moral that even in the worst case there are more chances of escape than would have been thought possible. Nobody would propose to set a new-born baby afloat on an ice-floe in the 77th degree of latitude, in the hope of ever seeing it again. Yet, as a matter of fact, the baby has turned up safe and sound at Newfoundland after its singular passage; and some of the other Esquimaux, we are assured, have faces of "moonlike rotundity," and appear to be enjoying robust health. The fugitives seem to have run some risk to their health from a sudden introduction to a warm atmosphere after living for a long time in a temperature at the freezing point, but otherwise they managed to support life much more comfortably than could have been expected. "Tanned sealskin" is undoubtedly a disagreeable article of diet, and the bear seems to have turned up at the nick of time. Yet we are told that they soon afterwards met plenty of seals; and the extreme hardship only lasted for a few days. On the whole, therefore, all that we really learn from this expedition seems to be pretty much what we knew before. Ships are in danger of getting nipped in the ice; when nipped, very unpleasant results may ensue, especially to a weak expedition; but such dangers have been constantly encountered by previous travellers, and may be reduced to a minimum by due forethought and preparation.

Meanwhile, the other results obtained are rather in favour of renewed enterprise. In the first place, Captain Hall reached the very high latitude of 82° 16′ with singular ease in the first summer of the expedition. He still saw, and, in the opinion of many of his crew, might easily have reached, open water ahead. He wintered in the highest latitude in which an Arctic expedition has ever remained. The returning members of the party declare that the climate is distinctly milder than it is several degrees further south. The plains were covered in summer by a vegetation sufficient to nourish numerous herds of musk-oxen, of which the expedition shot from thirty to forty. Though no natives were encountered, their traces were perceived, and drift-wood was picked up which had floated from the North through Robeson's Straits. In mid-winter, we are told that it was cold enough to fire bullets of frozen quicksilver through a two-inch board, which certainly does not suggest the existence of what is commonly called a genial climate. However, the winter was actually passed without any serious discomfort, and, with the exception of Captain Hall, nobody seems to have suffered from the exposure incurred. The facts, then, which the expedition has demonstrated are, that it is possible for a ship sailing in the spring to reach winter quarters beyond the eighty-first degree of latitude. The voyagers would then be within a distance of about five hundred miles from the Pole; they might send out expeditions in the following summer, and much greater distances than that to the Pole and back have been accomplished by sledge expeditions in less than three months. The unexpected mildness of the climate in the summer suggests the probability of some curious scientific observations. In short, it seems to be plainly within the bounds of possibility that one of the few romantic prizes of adventure not yet won by human daring is fairly within our grasp, and with every prospect of results beyond the mere gratification of the adventurous spirit. We need not at present go over once more the arguments against and in favour of Government assistance for new Polar expeditions. We are content to remark that the experience of the *Polaris* rather adds to than diminishes the strength of the case for renewed effort. Of course, the first popular impression is in the other direction. Whenever a railway accident happens, or a cab runs over a foot passenger, we are in the habit of holding indignation meetings, as though such things had never happened before, and as though our indignation would prevent their ever happening again. We ask our legislators to invent some self-acting machinery which shall make travelling of all kinds absolutely safe; and the last question we condescend to ask is the only one which is really to the point—namely, whether the average proportion of accidents to escapes is increasing or is greater than might be reasonably expected. It would be absurd to hope that the same methods of reasoning should not be applied to Arctic expeditions. The occurrence of a single mishap, whether or not it might have been prevented by reasonable precautions, will be triumphantly cited as a proof that such enterprises are immeasurably dangerous. Nobody will ask calmly what has been the proportion of lives lost to the number of expeditions undertaken, and how far that ratio has been altered by a single addition to the list of casualties. To attempt an Arctic journey will be declared to be a wanton courting of death, and the only chance of the rash adventurer will be held to be a return on a floating iceberg on a diet of tanned leather, with an occasional indulgence in Esquimaux baby. It is, however, some comfort that these spasmodic shrieks of alarm generally die away as rapidly as they have been raised, and if, as may reasonably be expected, the *Polaris* should come home in safety next autumn, we may pass from the cold to the hot fit, and be ready to express extreme disgust if a well-prepared English expedition should fail by any accidental stroke of ill-luck to eclipse the performance of a scratch crew of Americans and Esquimaux. However this may be, it seems pretty clear that a successful exploration of the Polar mystery can be only a question of time. Possibly the prize may fall to the lot of some bold adventurer, such as Mr. Leigh Smith, who is now running similar risks on his own responsibility; and in another generation or two such a trip may become as commonplace as a walk up the Matterhorn is at the present day. We should, however, be glad to see the feat performed in our own time; and at any rate we could wish that a mere argument from cowardice may not be sufficient to decide the question.

THE PERSIAN VISIT.

PERSIAN matters are not very largely understood in this country, and few perhaps have any definite personal idea of the Persian King who is about to pay us a visit. What he may be in himself hardly anybody knows. Some whisper that it is better not to ask. We may be pretty sure that any Eastern despot has done things which would not be endured in the most despotic or the most anarchic country of Europe. It is of the nature of an Eastern despotism that it should be so. In reading all Eastern history or fiction, we adapt ourselves to such a state of things. We do not blame an Eastern King for freely cutting off heads, provided only he cuts off the right heads. It is perhaps enough for us to think that an Eastern despot who breaks through all the habits and prejudices of his class so far as to make a journey to

Western lands must, in some points at least, have risen above the standard of his class, and that he can hardly fail to take back with him some ideas which must turn to the good of his kingdom. By us the Persian King is best looked on as the representative of the Persian nation. And the Persian nation is one which claims our interest on many grounds. The expected coming of the Persian King has been heralded in the newspapers with large references to Darius and Xerxes. We have been solemnly reminded that Persia is the only one of the four monarchies of the ancient world which still remains. We are indeed never quite sure about the four monarchies. We used to have Assyria, Persia, Macedonia, and Rome, to say nothing of the Fifth-Monarchy-men who turned up in the seventeenth century. But we believe that, since Scyths and Hamites came into fashion, there has been another reckoning, in which Macedonia and Rome, as mere European States, go for nothing, while the Fifth-Monarchy-men of the new reckoning are no longer the Levellers of Cromwell's time, but the Arsacid Kings of a time much earlier. Which of these reckonings is followed by the daily papers it might be unkind to ask; but it is possible that the new lights may not have reached Persia, and a Persian, in whose eyes the Ottoman Sultan is still the Cæsar of Rome, might fancy that another of the ancient monarchies was still going on as well as his own. But, leaving these subtle questions, there are points both in the past history and the present position of Persia which we may well call to mind when the ruler of Persia comes to show himself among us. And we have not the least wish to shut out Darius and Xerxes from the general view, provided they do not shut out everybody else, and provided nobody thinks that the present King of Persia is either their direct descendant or their direct successor. We need hardly warn anybody against believing that our royal guest is of the same religious persuasion as his ancient predecessors, as we find that the error to be fought against is, not that the modern Persians are universally disciples of Zoroaster, but rather a belief that the present King of Persia is, in some way not explained, the head of the Mahometan religion.

The dim notion of the newspapers about one of the monarchies of the ancient world going on still, about the "successor of Darius" and the rest of it, has thus much of truth in it, that the Persian nationality, as we have felt it our duty to explain more than once, has lived on in a most remarkable way. The ancient-monarchy view may perhaps leave out of sight such facts as those of Macedonian, Parthian, Saracenic, and Mogul conquests, and the fact of the large Turkish infusion, whether we choose to call it conquest or immigration. But it brings into sight, in its fashion, the fact that the Persian nation has contrived to live through all these things. Though it is queer to call Nasr-ed-din the "successor of Darius," yet the people over whom he reigns more directly represents the people of Darius than any of the great European nations represents those who dwelled on the same soil in the days of Darius. The Gaul and the Iberian have really lived on through all conquests, but they have lost the outward badge of their old national being by adopting the Roman language. The Persian has had masters of divers nations and he has adopted an Arabian religion, but the Persian language has lived on through it all. If any one chooses to infer that all this comes of the inborn superiority of an Aryan people struggling against Semitic and Turanian intruders, we shall not argue against him. Anyhow the fact is certain that the Persian nationality and the Persian speech have lived on through successive conquests, that conquerors and immigrants have been largely assimilated to the native stock, that Persia has twice, after long periods of subjection, risen again in the strength of a revived nationality, and that both times the revived nationality has taken the form of the preaching of a national religion. The dynasties both of the Sassanids and the Sophis cannot, without some straining of language, be called successors of Darius; but both may be fairly said to have revived the monarchy of Darius. We will not undertake to guarantee the pure Achæmenid blood of the restorer Artaxerxes, and the Sophis were pretty certainly of Turkish descent; but they revived the Persian nationality all the same, and, if they were in any sense strangers, the fact is no more wonderful than the fact that Simon of Montfort was a Frenchman, that Frederick of Sicily was a Prince of Aragon, and that the patriarch of the long line of the Kings of Paris was in truth a Saxon settler in Gaul. The Sassanid revival took the form of the preaching of the old national religion, the Sufiavean revival took the form of the preaching of a form of Mahometanism which the Persian national mind had worked out for itself, a way which orthodox Ottomans and Moguls called heresy. We believe, and we have before now tried to make others believe, that this long history of Persia, this abiding retention of a true national life under every kind of difficulty, is one of the most wonderful things in the history of the world, and that it clothes the Persian nation with a higher interest than any kind of talk about Darius and Xerxes.

When people get away from the Darius-and-Xerxes-and-four-monarchy view of Persia, they are apt to forget the wide distinction between the Persians and most other Mahometan nations. This confusion reached its height in the wild belief that the present Persian King is the spiritual head of Mahometans generally. It is hard to find a parallel in the West to so strange a delusion. Perhaps the nearest thing to it would be if any Persian were to tell his countrymen that the German Emperor was the common spiritual head of all Christian sects. Now, setting aside smaller and earlier Mahometan powers, of the three Mahometan powers which have cut any great figure in the world for the last four hundred years, the Ottomans, the Persians, and the Indian Moguls, the Persians stand alone as being really a Mahometan nation. The other two, the Ottomans and the Moguls, were essentially foreign conquerors, ruling over subject nations of other religions in their own land. So to be was not an accident but the essential feature of their position. The Ottomans have always been, not a nation, but a ruling caste; a ruling caste which, in the days of their strength, was replenished by the human tribute of all the subject nations. Even in those parts of the Ottoman Empire where the population is mainly Mahometan, the Ottomans are still a ruling caste over the earlier Mahometan inhabitants, including, of course, the earlier Turkish settlements before the Ottoman dynasty arose. So in India the Moguls were, in the like sort, a ruling caste over a people mainly Hindoo, but with a sprinkling of heretical Mahometans and people of other creeds. Thus the Moguls then, and the Ottomans still, represent not only Mahometanism, but Mahometan ascendency; the very essence of their being is the supremacy of Mahometan conquerors over subject nations, Christian or heathen. The Persians are nothing of the kind; they are strictly a Mahometan nation. At the same time they are, as it were, Mahometans by accident; and, as we before said, their Mahometanism is a form of Mahometanism of their own making. If we draw out a comparison between the history of Christendom and the history of Islam, the Arabian Caliphate, the original Mahometan power, answers to the Roman Empire, politically, though not theologically, the original Christian power. The various Turkish tribes—and the Indian Moguls were really as much Turkish as anything else—adopted Mahometanism as they came within the influence of the Caliphate, just as the Teutonic and Slavonic nations adopted Christianity when they came within the influence of the Empire. And to them no doubt their conversion to Islam was a lift in the order of things; they were raised from mere barbarism to that moral and social stage which the higher form of Mahometanism represents. With the Persians nothing of the kind happened; the Turks freely accepted Mahometanism in the course of migrations which brought them within the reach of a religion and a civilization which were at any rate higher than their own. To the Persians, on the other hand, Islam came as something forced upon them by foreign conquerors. Mahometanism, in its first purity, might be a better theological system than the religion of Zoroaster as it stood in the days of the last Sassanids. But the Persian, with his magnificent Empire and his ancient civilization, could not feel towards conquerors from the Arabian desert as the Teutons and Slaves felt towards the Roman Empire and religion, or as the Turks felt towards the Caliphate in a somewhat later stage. In fact, Persia, to a great extent, led captive her Arabian conquerors, and turned the Caliphate of Bagdad into something very different from what it had been when Abou Bekr and Omar ruled half the world from the steps of the mosque at Mekka. The Persians became Mahometans because they could not well help it, and they revenged themselves in the end by giving their Mahometanism a national character of their own. But, in so doing, they became more strictly a Mahometan nation than any other, as the whole people, with the most trifling exceptions, gradually came to accept the religion which was at first forced upon them by the sword. Had it been otherwise, had the mass of the Persian people stuck fast to the creed of Zoroaster, as the mass of the Greeks and Bulgarians stuck fast to the creed of Christ and the mass of the Hindoos stuck fast to the creed of Brahma, Persia too would have been another case of a conquering Mahometan caste ruling over a nation of another religion. But as the mass of the Persian nation itself became Mahometan, the few who clave to the ancient faith, and the few Jews, Christians, or members of any other religious bodies, became, strictly speaking, Dissenters from a national faith. No one could call the Christian subjects of the Ottoman, or the Hindoo subjects of the Mogul, Dissenters from a national religion. They are nations which kept their own religion under a bondage alien both in blood and faith. It is not a case of nonconformity, but, a case of national and religious subjection, like that of Ireland in the days of Protestant ascendency. But Christians, Jews, and Fire-worshippers are in Persia strictly Nonconformists. Judaism and Christianity are the religions of foreign settlers, and the few Persians who still cleave to the faith of the land before Islam came into it, answer in some sort to the Roman Catholics in England. We suspect that, as a rule, the Persian Nonconformist has been worse off than the subject nations under the Mogul or the Ottoman. The Irish Papist in the worst time was not quite so badly off as the English Papist under Elizabeth, or the Scotch Presbyterian under Charles the Second. But mere religious intolerance can always be done away with by better legislation, while no legislation can do away with such differences as those which part off a conquering caste of one religion from subject nations of another. In India the difficulty has been solved by bringing both races and creeds under the rule of conquerors who are impartially tolerant to both. How it is to be settled in South-Eastern Europe it is not for us to say; to risk even a guess would be to commit the deadliest of sins in diplomatic eyes, the sin of "reopening the Eastern question."

Whatever then our royal guest from Persia may be in any other way, he is at least not the alien ruler of subject Christian nations. He has not trampled a Christian people under foot. He is the head of a Mahometan nation, a nation at once the most purely and the least truly Mahometan of any of the great Maho-

motan powers of modern times. And, without guaranteeing the pure Aryan descent of this particular King, we may say that he is at least the head of the one great Mahometan nation which still preserves signs of primeval kindred with the great nations of Europe. As such he is a reasonable object of interest in our eyes. And, if it adds to his interest in anybody's eyes to call him the "successor of Darius," we will not greatly quarrel with the description, though it is rather like challenging special regard for the Ottoman Sultan on the ground of his being the successor of Philip of Macedon.

THE PRIESTHOOD IN SOUTHERN ITALY.

IN no part of Italy are we able to study the great ecclesiastical revolution which is following hard on the political changes of the last twenty years with the same interest as in the South. Rome is as yet untouched by the threatened law of secularization or suppression. The Church reforms which preceded the French Revolution in Tuscany and the Milanese, as well as the temper of the people itself, had left so little power to the priesthood that the more sweeping measures of our own day produced comparatively little effect either socially or religiously. Piedmont was the one province of Italy where the influence and number of the clergy equalled their influence and number in the South; but in Piedmont the work of the revolution has been long since done. Though the peasant of the Riviera may still regard the failure of his olive crop as a judgment on the land for its defiance of the Papacy, the moral and industrial advance of the population of the North as a whole has effectually seconded the law in its transformation of the character of the priesthood. But from Terracina to Girgenti the Church and the Revolution are still face to face, and, vast as is the change which has been already brought about, the process of social and ecclesiastical reconstruction is far from being at an end. Nowhere, up to the moment when Garibaldi swept the Bourbons from their capital, had the priesthood so firm a hold. Its numbers were enormous. In Sicily the clergy and the religious of various orders constituted a hundredth part of the whole population; in Naples the priest was the centre of every group in the streets. The wealth of the Church, though impaired by the confiscations of the French occupation, was still immense, while its power was greater than in the days of Hildebrand or Innocent. Half from policy, half from superstition, the later Bourbons relied on the clergy as the main support of their system of despotism, and, great as its services were, they were purchased at an almost incredible price. If the priest preached unlimited obedience to the pitiful tyranny of Ferdinand or Francis, if he held Liberalism in check by a system of religious espionage, of spiritual terrorism, or even by betrayal to the authorities of the secrets of the confessional (and under Ferdinand II. the confessional was notoriously put at the service of the police), he demanded in return judicial and administrative independence. The Church was exempt from all secular jurisdiction and subject only to the court of the bishop. Not only was the civil power held sternly at bay, but it was turned into an engine of spiritual coercion. The communal syndic was employed in driving the truants of the commune to mass. Where the schoolmaster existed he was forced to drive his boys to the confessional. The censorship of the press was as rigid in its exclusion of heretical as of revolutionary publications. Any laxity in religious observances at once enrolled a Neapolitan in the list of "suspects," and placed him under the ban of the police. And not only did the priesthood use the civil magistrate as its tool, but it was the one power left in the South which could venture to cross his path. Within a limited sphere the clergy assumed a sort of tribunate of the plebs, and the presence of a priest in a household secured it at any rate from the worst outrages of the local tyrants who caricatured the system of their royal master. The result was that every family of any importance contributed its "little priest" to the ranks of the clergy, and every country town saw a swarm of young neophytes who tumbled out of the seminary into the street in all the glory of shovel-hats and miniature soutanes.

With the expulsion of the Bourbons the whole of this fabric of ecclesiastical power fell suddenly to the ground. The numbers of the clergy were roughly curtailed by the suppression of the monasteries, of the cathedral chapters, and of the collegiate churches, which were more numerous in Southern Italy than in any other part of the Catholic world. A glance at an Italian village shows what an enormous social revolution this mere reduction of numbers must be bringing about. In a little town of the Riviera, whose population hardly reached ten thousand, the number of priests before 1850 exceeded two hundred. In the island village of Capri, at the other extremity of the peninsula, a parish of fifteen hundred souls required the services of twelve canons, a vicar, and a score of mass-priests. In the one case the clergy have already sunk to forty, and in the other the vicar will soon be the only representative of his order. It was, above all, through their enormous numbers that the influence of the clergy penetrated into every home and through every class in Southern Italy, and the loss of importance involved in this rapid diminution is already telling on their social position. Their political power has wholly disappeared. Ecclesiastical jurisdiction, bishops' courts, bishops' prisons, clerical immunities and privileges have been utterly swept away. The priest has not only ceased to serve as a defence against the civil power, but the hatred and contempt which the legal and judicial classes lose no opportunity for displaying towards his order make his friendship or interposition simply damaging to his clients. With the loss of power the supply of "little priests," and the valuable connexion with the middle classes which it involved, have almost everywhere broken down. The boys themselves shrink from joining an order which is rapidly sinking in popular esteem, and the trader or the small landowner no longer views with favour a profession which has lost influence as it has lost wealth. Poverty again is fast dissolving the hold of the priesthood on the upper classes. The clergy of Italy, like that of France before the Revolution, has hitherto consisted of two sharply defined orders, the larger part consisting of curés and mass-priests, the smaller of the higher and dignified clergy. The ample endowments of bishoprics, chapters, and collegiate churches tempted the poorer nobles to devote their younger sons to the priesthood, while the poorer and more directly spiritual charges were left to the children of the small shopkeeper or the peasant farmer. With the abolition of the higher preferment, however, this connexion between the gentry and the Church has ceased to exist, and in Italy, as in Belgium or Ireland, the clergy are fast sinking into a peasant priesthood, with few links to unite it to the wealth, the leisure, the culture, the refinement, or the moderation of the world without.

But if the Church has lost more in the South than elsewhere from recent changes, in no part of Italy is its gain likely to be so great in the end. The moral reform which has followed everywhere throughout the Catholic world on the loss of power and position by the clergy must tell most on the clergy of Southern Italy. Without adopting all the scandal of their Liberal opponents, a little experience of Neapolitan or Sicilian villages reveals a state of things among the priesthood which is startling enough to those whose experience of clerical life has been drawn from an English parsonage. The "parroco" naturally shares the passions and the temper of the peasant class from which he springs. His ordinary talk is simply that of his home, seasoned with words and phrases of a grossness almost incredible to English ears, but from which English ears are for the most part shielded by the patois in which they are conveyed. The confessional is the fount of half the impurity of the village. The sermon is larded now and then with stories broad enough for a taproom. The chat of the Piazza turns on the peccadilloes of the clergy, on the luck of Don Ambrogio in finding the episcopal prison to which he had so often been consigned closed against him by the Constitution, or on the resemblance of the dark-eyed little gambler who is playing at knuckle-bones in the Piazza to that sly Don Natale. But already there are signs of a healthy change. The mere reduction in numbers, falling as it does principally on the idlest and most worthless of the clergy, naturally improves the tone of those who remain. The collegiate chapters, so frequent in the South, were nothing but groups of indolent ecclesiastics who lowered the whole temper of their class. In a village with which we are familiar the arch-priest is the recognized father of more than one chubby urchin. The senior canon is the village usurer, one of his colleagues occupies his time in watch-making, and another is generally to be found snaring birds for the supply of his luxurious table. Clerical loungers of this class will die away as the laws of suppression gradually produce their effect; but besides the extinction of the idler clergy, the very prevalence of Liberalism, the rise to power of a class bitterly hostile to the priesthood and eager to seize on every scandal as a means of assailing it, operates, no doubt, as a check of a very efficient kind. The wonderful change which has taken place in the moral temper of the French priesthood, and the very small amount of scandal to which it gives occasion, are obviously due to the fact that every priest in France knows himself to be living beneath the scrutiny of a host of Voltairean eyes. The weakness of human nature is a good deal aided everywhere by the fear of detection, backed by the shame of an almost certain exposure; and in Southern Italy the hostility of the "Liberals" is already raising the moral tone of their clerical opponents. Everybody recognizes in the new and younger village priest a man of very different stamp from his easy-going predecessor. He is a great deal less pleasant and sociable, but then he is a vast deal more clerical. The gossips in the Piazza hate him as a busybody, but they have no scandal to tell about him. He multiplies services and processions, sends about the Bambino from house to house, brigades the village girls into guilds of St. Mary or St. Agnese, brings in mission preachers to whip themselves in the pulpit during Lent, and himself preaches vigorously against Liberalism and the persecutors of the Church. His whole attitude, in fact, is not only active but belligerent. Probably the greatest mistake of the Italian Government throughout all the recent ecclesiastical changes has been the contemptuous indifference with which it has treated the lower clergy. In the earlier days of the national struggle they were far from being hostile to the cause of Italian independence or unity; indeed, the number who came forward to support the protest of Father Passaglia showed that the new Government might count on a large number of adherents among the parish priests, if it took measures to protect them against the bishops and against Rome. But the policy of Ricasoli was wisely, or unwisely, set aside for what was believed to have been the policy of Cavour; in the name of "a Free Church" the clergy were stripped even of their existing rights and given over to the absolute control of the episcopate, while the "Free State" refused to deal with the priesthood save through their bishops and the Pope. The faint sparks of independence were soon trodden out; the Liberal vicars, who came boldly to the front at Naples, found themselves outcasts and excommunicate, while, as if to extinguish any spark of sympathy for itself in those who submitted, the Government struck thirty per cent. off the meagre pittance it had

reserved for them, and threw endless administrative difficulties and delays in the way of their receiving any stipend at all. The result is, naturally enough, that every Southern priest is an enemy of Liberal government, and that the younger priests who are now coming to the front are bitter and energetic in their enmity.

There are already signs indeed that a struggle is approaching in which Italian Liberalism will find itself confronted with much the same difficulties that have proved so embarrassing to the Liberals of Belgium. The policy of abstention has been only upheld by the resolute will of Pio Nono, and there is a general belief that whoever may be his successor will at once abandon it. Already the Archbishop of Naples, Cardinal Riario Sforza, one of the ablest men in the sacred College, has broken in spirit, though not in form, through the Papal injunctions, and the result has shown that in the largest of Italian cities the priest is supreme. No oath of allegiance to the King is required from a voter at the municipal elections, and the Archbishop profited by the omission to bring forward clerical candidates and to secure a clerical majority in the City Council. The blow was a hard one, and the bitter outcry of his opponents shows that it has been felt; but its force lay in the fact that the victory was won in a great urban centre where Liberalism had believed itself secure. Not even the most enthusiastic of Liberals dreamt of contesting the supremacy of the priest in the rural districts. The peasantry of Southern Italy are devout and priest-ridden to a man. The churches, unlike those of other parts of the peninsula, are crowded, not with women only, but with men—rough farmers and fishers—on their knees, joining heartily in litanies and Ave Marias. The Church has, in fact, towered over them till they have lost the power of doubting or questioning; it is only a few years ago that the monks whose huge house frowns down on the village, or the canons whose dome overhangs the cluster of rural roofs, were their lords. They held the soil; they spent, they took, they lent, they gave; and though monks and canons have disappeared, the impression of their power remains. With the dissolution itself the peasant, unlike the citizen of the towns, had nothing to do. Of the political revolution which relieved him of the Bourbons he understood something; his wishes were in the main for it, and even now that he has to pay for liberty in a heavier taxation, he is still fairly loyal to it. But of the great religious changes that followed he understood nothing at all. The clergy who suffered were for the most part his kinsmen and neighbours; and the only direct effect of their suppression was to give him non-resident landlords instead of resident ones. Unhappily, too, the great material tie which the purchase of the Church lands created between the peasant and the State in the French Revolution is almost wholly absent from Southern Italy, where the boldest peasant quailed at the threat of excommunication which was denounced by the priest against the buyers of sacred ground; and where we have known men who defied the threat forced on their death-bed to restore their purchase to the Church by the menace of being buried like a dog. Broken, too, and maimed as it is, the Church is still the one great social institution which the Southern peasant sees and knows. Its "festas" are the single source of poetry and amusement in his life. He has no café, no journals, no reviews, no great secular fêtes, as the dwellers in towns have. But he has his Cradle-show at Christmas, his show of the Wise Men at Epiphany-tide, his procession in the spring ere the boys start for the coral fishery, his procession in summer through the vineyards for the blessing of the vines. The priest, in fact, is not merely the centre of his religious life, but of his social life too. Education is the only serious danger to his supremacy, and the first sign of the clerical movement in Southern Italy has been the new attitude of the priesthood towards the schools. The school of the rural commune is practically in the hands of the Communal Council—in other words, of the village farmers who are its paymasters—and in place of the contemptuous indifference with which the clergy at first regarded the educational institutions of the new Government, they have now begun to use their influence over the Council to secure the control over them. In more than one Southern village the schoolmaster finds himself compelled to teach the new episcopal Catechism and to instruct his pupils in the doctrine of Papal infallibility, while a teacher who fairly sets himself in opposition to the priest finds his school deserted and his income crippled by the Council. The new Educational Bill which we lately noticed, and which practically withdraws the control of the school from the hands of the village farmers, is a sign that the Italian Government has recognized this new danger, and is resolved to meet it boldly. But the true security of Liberal Italy lies, after all, in the utter inability of the priesthood to use the vast advantages of their position. The moral force which the clergy might still wield is squandered on excommunications of Radical newspapers and the coarsest abuse of the existing Government, while the grossest immorality in their flock passes uncensured, and no clerical name is ever seen among the protests against that hideous cruelty to animals which is the disgrace of the South. Till the priest takes a very different moral and spiritual position from that which he at present occupies, it is hard to believe that mere ecclesiastical activity will avail permanently to arrest the general progress of Italy. But there can be little doubt that in the present condition of the South the clergy may inflict on their Liberal opponents, if the present movement is really carried out, a very considerable and humiliating check.

FISH.

A WRITER in the *Times* has very justly observed that nobody would imagine, from the tariff of an English fish market, that we were an insular people, with some of the finest fishing grounds in the world along our coasts. Why should fish be an expensive luxury in a country like this? There appears to be abundance of fish in the sea, and there is certainly a profitable market for all kinds of fish in our large towns. Here then we have the supply and the demand both at hand. How is it that they cannot be brought together on less onerous terms? As far as London is concerned, there is not much difficulty in explaining the absurdly high price of fish. In London the trade is carried on under artificial conditions which practically convert it into a monopoly in the hands of a comparatively small body of dealers. The root of the mischief is to be found at Billingsgate. Anybody who will take the trouble to go to Billingsgate in the early morning will see for himself the sort of difficulties which are thrown in the way of the free distribution of fish through the metropolis. Billingsgate Market is a place of limited extent, lying in the midst of a maze of narrow streets and lanes, and very difficult of access. Long before you reach the Market you find the streets and lanes blocked with carts and barrows of every description. They extend as far as London Bridge on one side, and as far as the Tower on the other, and overflow into all the alleys of Eastcheap. A fishmonger who is a little late has to leave his trap half a mile or a mile away from the place where he is going to do business. The market itself is crammed to suffocation. It is scarcely possible to move about in it. The people are swept to and fro in currents, and woe betide the luckless wight who tries to strike out an independent course for himself. Porters with huge boxes on their heads struggle heavily through the dense throng. The shouting and hubbub are deafening, and the confusion distracting. It is obvious at a glance that whatever may once have been the fitness of Billingsgate for the purposes to which it is applied, the trade has long since outgrown the narrow accommodation set apart for it. The Market is absurdly small for the thousands of people who have to do business there, and even if it were of more reasonable dimensions, the approaches to it would still be sufficient to condemn it. A fishmonger has not only to make his purchases, but to carry them away with him. He has to leave his cart or barrow at a distance from the Market, and he must have some one to look after it for him while he does his marketing, and he has also to hire a porter to carry the fish to the cart. This is not only a matter of inconvenience; it adds to the cost of the fish. It may be only a few pence, but a few pence are a serious matter to a poor costermonger, especially when they have to be paid every time he goes to market. The fish trade is in many respects a troublesome one. The commodity is perishable, and the supply varies from day to day. Some days fish are hardly to be got for love or money, and on other days there is quite a glut of them. It is not desirable, however, that artificial difficulties and inconvenience should be wantonly contrived in order to drive off dealers. There is another grievance connected with the want of room which must be mentioned. It is a rule of the Market that all fish is sold, as the phrase is, "with its faults and errors of description," and the retail dealers complain, we believe, that they are often shamefully imposed upon. The meaning of the rule is simply that they have to buy their fish in a poke, and have no redress if, when they open the package, they find short measure or any other deficiency. The fishermen are accused of sometimes making up for a small catch by filling the baskets with all sorts of rubbish; but a dealer who is victimised in this way has no alternative but to submit. If there were more space, the dealers could open the baskets and see what they were buying. But as it is, anything like examination is of course utterly out of the question.

One side of Billingsgate, as everybody knows, is open to the river, and that is its only justification as a fish market. If it were true that all fish were brought to town by way of the river, that would no doubt be a very good reason why the fish market should necessarily be on the river-side. But, in point of fact, only a small part of the fish supply of London arrives by this route. The railways are now the great carriers of fish, as of everything else, and a considerable proportion of the fish sold at Billingsgate has been carted there from the railway stations. It will be seen that the way in which the distribution of fish in London is managed is this—the fish, with the exception of what comes by boat, has to be conveyed from Paddington, Euston Square, King's Cross, or Shoreditch, to Billingsgate, an out of the way place, four or five miles off, in an almost inaccessible situation, and then re-conveyed from Billingsgate to other parts of London, a good deal of it going straight back the way it came. It is obviously impossible to conceive a more absurd and preposterous system than this. An attempt has been made to establish a fish market at Columbia Market; but, for some reason not clearly understood, the experiment appears to have been attended with only indifferent success. Vested interests are strong, and they are naturally opposed to any change; and, besides, Bethnal Green is perhaps rather out of the way of West-end fishmongers. What is wanted is a fish market in a more central situation, say near King's Cross. A city of three and a half millions of people should surely have more than one fish market.

But even supposing that there were proper facilities for the sale of fish, there seems to be a difficulty in persuading fishermen, or

at least Irish fishermen, to take the trouble to catch them. The Report of the Inspectors of Irish Fisheries, which has just been published, laments the decline of the fishing trade in that country. It is calculated that in 1846 nearly twenty thousand boats or other vessels were engaged in the Irish fisheries, manned by over a hundred thousand men and boys. Last year the number of boats had fallen to eight thousand, while the men and boys engaged in the trade were scarcely over thirty-one thousand. Indeed there was a decline in 1872, as compared with the previous year, of about a thousand boats and seven thousand men. Many of the fishermen have no doubt emigrated, and others have probably given up fishing because they have found something better to do. The decline of a precarious and poorly paid industry is not altogether to be regretted, if it is due to the men engaged in it being drawn off to more profitable employment. Besides, the statistics of the earlier period appear to be open to some doubt. After making every allowance for these circumstances, however, there remains the fact that the Irish fisheries are by no means so productive as they ought to be. The pilchard fishery, we are told, was not prosecuted in Ireland during 1872 with any show of enterprise, although large shoals of those fish appeared on the coasts of Cork and Kerry. It is also stated that the Irish boats engaged in the herring fishery at Howth numbered only 116 as against 268 from Scotland, the Isle of Man, and Cornwall. Again, we find that two more Irish Fishing Companies have collapsed, and that there is now, properly speaking, no joint-stock Fishing Company in Ireland. We are led to the conclusion that the fisheries have fallen off because Irishmen do not care to go fishing, and because capital is not forthcoming for fishing enterprises. The Inspectors are still in favour of Government loans. Indeed they would hardly be Irishmen if they were not. "No great improvement," they say, "can be looked for in the sea-fisheries until loans are advanced for the repair and purchase of boats and gear." In other words, Irish fishermen must be bribed by Government subsidies before they can be induced to compete with Scotch, Manx, and Cornish fishermen, who find it quite worth their while to equip boats at their own expense and to come from a distance in order to share in the spoils of Irish waters. It is unfortunate that Irishmen will not fish in their own waters without a Government guarantee; but it is doubtful whether the loan system would lead to satisfactory results. An "Irish County Member" has written to the *Times* to suggest that the best way of taking the wind out of the sails of Home Rule would be to give loans to Irish fishermen as the Home Rulers propose. It seems to us that this would rather put wind into the sails of Home Rule, for all other classes of Irishmen would at once put in similar claims for compensation from Government for their own inertia and idleness. It is much easier to howl about Home Rule and the wearing of the green than to go out to sea and catch fish.

There would seem to be little doubt that the Irish fishing business is in want of capital, and it is not very difficult to discover the reasons why capital is not forthcoming. We gather from the Report of the Fisheries Inspectors that last year a serious conflict broke out at the Claddagh, in Galway Bay, "where a section of the men rose in arms against the trawlers, with whom they have had wars on previous occasions," on account of the use of trawl nets. The "aid of a gunboat had to be evoked," and the Inspectors held a public inquiry on the trawling question; but, "after a lengthened investigation, no satisfactory conclusion could be arrived at, the witnesses being all more or less biassed, according to their prejudices," and "some of those interested were afraid to become witnesses in the inquiry, making affidavits that their lives would be in danger if they attempted to come into court." More recently the fishermen of Kinsale threatened to pull down the houses of the fish-buyers over their heads unless they would agree to pay such prices as the fishermen chose to dictate. Confidence is a plant of slow growth in the breast of capitalists, and if once it is nipped by a blight of terror or suspicion it takes a long time to recover. It can hardly be said that the readiness of Irish fishermen to take the law into their own hands is likely to be attractive to capitalists. Capital is not exclusively a Saxon luxury. There is capital also in Ireland, and there are certainly Irishmen in England who possess abundant means for investment. But if even Irish capitalists are shy of putting their money on Irish fishermen, it can only be because they think the fishermen are deficient in something else than money to patch up their boats with. Nothing could be simpler than to make loans to Irish fishermen. But there might be some difficulty in collecting the money as it fell due. The Chancellor of the Exchequer may be forgiven for doubting the expediency of making advances which could only be recovered by evoking the aid of a gunboat. The Inspectors observe that although the fishing Companies have all come to grief, smaller enterprises entered into by practical men having a thorough knowledge of the art of fishing and of the best markets in which to sell their fish have usually proved successful. We fear there is too much reason to suppose that the enterprises which have not been successful were conducted by men who were not remarkable for their thorough knowledge of the art of catching or selling fish. Whether men who are weak in this respect would be much helped by grants of Government money may perhaps be doubted. And in regard to the proposed loans, we should like to know whether it is intended that they should be confined to natives of Ireland, or whether the Scotchmen, Englishmen, Frenchmen, and Dutchmen who fish off the Irish coasts are to receive similar encouragement. The Inspectors appear to be ignorant of the fact that what is called a bonus to Scotch fishermen is in reality a tax exacted from them for warranting the soundness of their fish.

A MANUAL OF DRESS.

THERE exists a series of manuals by which we may learn how to behave, to play whist and other games, and to make jokes and speeches. The last number of this series instructs ladies how to dress, and perhaps the author of it would say that she wrote for ladies only. But anybody may buy a book which is exposed for sale at a railway stall, and although the management of gowns and bonnets is the exclusive province of ladies, yet when it comes to the management of husbands we think ourselves interested in the discussion. The details into which this author enters are necessarily unintelligible to the sex for which she does not write; but every male reader will understand her when she takes what she calls a broad view. She complains, on behalf of herself and other women, that their greatest difficulty when they attempt economy is the opposition which they meet from men, "who are willing enough to deal in generalities, and always agree with you theoretically on the necessity of economy," but when the actual facts of the practice are brought before them, call it stinginess and meanness. The author has the candour to admit that these complaints are frequently well founded, "for many women are apt to degenerate under the process, and become to all intents and purposes little else than an economical apparatus." This remark is true of many women and of some men. The habit of saving continues after the necessity has ceased; but as women live less in the world than men, domestic influence operates more strongly upon their minds. The men of our generation are certainly not remarkable for small economies, and it must be allowed that many men can earn a pound more easily than they can save a shilling. Yet the men who took care of their shillings, if not particularly amiable, had something nearly allied to heroism in their nature. They saved their own money and spent freely the money of the State. *Sic fortis Etruria crevit*, as Mr. Lowe is fond of saying. An author who knows well middle class life of England has pointed out that in the early years of this century fortunes were made slowly and almost imperceptibly, and the possession of wealth could not change the habits which had been formed in acquiring it. One of the rich uncles in the *Mill on the Floss* would have driven some way round to escape a toll, and would have done so equally whether he was travelling at his own or an employer's expense. Scott, again, was thoroughly acquainted with this class in his own age and country, and the protest which he ascribes to the miser in *Old Mortality*, that a dip-candle was good enough to see to die by, scarcely caricatured the frugal practices which have made Scotchmen prosperous throughout the world.

But to return to our immediate subject, the lady from whom we are quoting assumes that men will not endure economy in families unless it is disguised. Tact, she says, is wanting to throw a cloak over bare bones. By tact a wife can do what she thinks is right, and at the same time persuade her husband that she is doing what he pleases. It is rather humiliating to find that, when women talk confidentially among themselves, they always assume as the basis of their little plans that men are capable of being deceived by transparent artifices. The author, after dwelling generally upon the value of tact applied to economy, proceeds to give "a wonderful instance" of it, which we think very wonderful indeed. "Breakfasting at the house of a lady (a model of carefulness), I was surprised to see her looking, not only with equanimity, but with positive pleasure, at her husband, who was emptying the cream jug. (I must do him the justice to say that every one else had finished)." We should certainly spoil this story by attempting to abridge it, and unless we gave the author's own words, no reader would be likely to believe that there exists a lady who knows another lady who has a husband who habitually makes a clearance of the cream at breakfast. The first remark that we have to make upon the story is that the *Manual of Etiquette* of the same publishers might usefully be perused by the gentleman who has an unrestrained partiality for cream. There may perhaps be families where the head is particularly fond of bacon at breakfast or of fish at dinner, and after satisfying the desires of his wife and children and guests, appropriates the residue of the dish to himself and consumes the whole. But the case of the cream was quoted, not as one of gluttony, as we might have hastily supposed, in the husband, but of tact in the wife. It appears that the admirable lady who contemplates with equanimity the consumption of her cream is practising all the time one of her pet economies; "for," she says, "after his cream my husband is so thoroughly satisfied that he is master in his own house, that he is quite content to walk to his Club; had I remonstrated with him, he would probably have taken a hansom." We do not know how much cream a husband in constant practice could consume at breakfast, but we know that a hansom cab costs at least a shilling, and we should think that a shillingsworth of cream could not be swallowed without unpleasant consequences. We should need the combined talents of the late Mr. Mill and Dr. Mansel to analyse satisfactorily the mental processes by which a husband who has had plenty of cream for breakfast concludes that he is master of his own house, and a husband who has not had plenty of cream for breakfast concludes that he ought to take a hansom cab. Perhaps in continuation of this series of manuals we may get one upon logic for ladies, which may elucidate this

obscure subject. There is of course a moral to this tale, which is that the cream jug should be kept full—diluted if necessary, but always full. We can only say that a husband who is greedy of cream, and yet is capable of being put off with milk, must be a very remarkable compound of selfishness and stupidity. Perhaps in the case of a wife of very great tact and a husband of extreme simplicity, it might be possible to maintain the fiction of household sovereignty upon sky-blue milk and water. The author ends the chapter by saying "Such is life." We can only say that we hope not.

This parable of the cream jug which may be filled if necessary with milk embodies, we think, the principle of the entire work. Husbands are to be treated like cats. A well-managed husband has his daily supply of cream, or at least of milk or milk and water, and his fur is never rubbed the wrong way. The author felt quite sad to think "of the husbands, brothers, and male relations in general who are daily rubbed up the wrong way by their womankind on limited incomes." We are once more reminded of the wife in the *Mill on the Floss* who daily rubbed up her husband the wrong way, not because his income was limited, but because it had been limited when she formed the habit of rubbing him up. This lady had an economical practice of not assuming her "front" until after breakfast, but whether her husband or society gained or lost by this practice is not explained. We may remark with diffidence that, having glanced over the pages of this Manual which are specially addressed to elderly ladies, we found, with a surprise which is doubtless based in ignorance, that the subject of "fronts" is not therein discussed. Indeed, in looking over tables of expenditure intended for ladies of all ages, we observe that nothing is allowed for hair, unless indeed it comes under the title "sundries." If we venture to ask a question upon the book, the author will probably answer that we have no business to read it. We can therefore only remark that if a lady who dresses on 15*l.* a year, according to the author's programme, is obliged among other economies to wear her own hair in its natural colour, she could hardly adopt any expedient more agreeable to the majority of mankind. It was remarked when the siege of Paris began that the women had suddenly become good-looking, because those who could afford expensive accessories of dress had departed, and only those who were compelled to dress naturally remained. If this remark were well founded, it supplies encouragement to those ladies who may attempt, by the help of this author or otherwise, to dress on a small fixed allowance. A few fashions have been invented to display female charms, and many to disguise the want of them. The difficulty under which the author of this Manual labours is that she can only advise as to material and shape of dress, while the harmonious arrangement of colours cannot be taught by the unaided pen. Lectures are now given to ladies on cookery, and perhaps they would be equally useful as regards dress. You cannot go to any public place without seeing women who have no taste in dress themselves, and want either willingness or power to obtain guidance from those who have. With such women the more money they spend in dress the worse it looks. They buy several things because they are separately handsome, or at least expensive, and put them all on together. It were to be wished that women devoid of taste could be brought to adopt the opinion of this author, that "the essence of comfort is to slip through life in an unobjectionable black silk." The author warns ladies who are obliged to dress on 15*l.* a year that "they must not make it a matter of conscience to rush into mourning on the slightest provocation." We think, however, that a period of general mourning has something of the charm which was ascribed to the siege of Paris, and in this point of view even Republicans of taste must admit the advantage of a well-developed Royal Family. The problems of dress would perhaps become easier if ladies could settle whether their object is to spite one another or to please men. The latter object is not perhaps easier than the former, but it is likely to be attained, if at all, at much less cost. The author proposes to her readers as their special object the attainment of a condition which she calls *chicdom*. We can only hope that she chooses her dress better than her words.

COMPLICATED COMPLICATION.

THE Licensing Act of last Session has again undergone the sarcastic criticism of the Court of Queen's Bench. Mr. Justice Blackburn wished that Mr. Bruce might sit beside him and listen to the discussions which arise upon this Act. The Lord Chief Justice stated on a previous occasion that he had never seen a more confused and puzzling Act than this. The section then in question was utterly bewildering. It was, in fact, the most complicated complication he had ever met with. The Legislature must have had some intention on the point, but what it was he was unable to discover. Mr. Justice Blackburn, while agreeing in the general spirit of the remarks of the Lord Chief Justice, took exception to his description of this Act as the most confused specimen of modern legislation. That place was, he thought, properly to be assigned to the Public Health Acts.

This is how Parliament deals with matters such as the Sale of Liquors and the Public Health which concern everybody every day. It makes laws which not even the Judges can understand. We have lately seen a paper read before the Statistical Society which describes how the author, Mr. F. H. Janson, an experienced solicitor, endeavoured to guide the parish in which he resides in taking measures in anticipation of cholera in 1870. He referred to the Sanitary Act of 1866, in which he expected to find the existing sanitary code. The first point to be ascertained was with whom the power of acting lay, or, in the words of the Act, who was the "sewer authority." For this information he found himself referred to a previous Act, the "Sewage Utilization Act," and after some study he satisfied himself that the "sewer authority" was the vestry of the parish. A vestry was accordingly summoned without delay. The Act conferred considerable powers on the "sewer authority." These powers were actively exerted. Disinfectants and medicines were provided, and sanitary inspectors were appointed. Some very useful results followed, but the power of the "sewer authority" to compel obedience to sanitary laws was challenged by the indolent and refractory, and its action became paralysed. The Board of Guardians, who had been constituted the sanitary authority under the "Nuisance Removal Acts," had no idea of being displaced, demurred to interference, and all but encouraged opposition to the vestry. They contended that sufficient machinery for carrying out the objects of the vestry existed under the "Nuisance Removal Acts," and they intimated that they should disallow any rate imposed to meet the expenses incurred by the vestry. Hereupon the vestry consulted counsel, who advised that "inferentially it was clear" that the vestry was the "sewer authority," and that they had certain powers, among which the power of paying the expenses of efficient action was not included. He also advised that they had no power to interfere with the occupation of damp or defective houses, or with the use of polluted wells. Ultimately it was admitted that the vestry was the "sewer authority," but the immediate danger which had aroused the inhabitants had passed away, and they were informed that a Bill would be brought before Parliament which, if passed, would remove existing difficulties.

This, then, is how sanitary legislation stood in 1870. A vestry desire that neither themselves nor their neighbours should die of cholera. They think the action of the Board of Guardians insufficient for their protection, and they proceed to take care of themselves. Immediately they are confronted with legal difficulties, and cannot stir a step except under advice of counsel. However, these difficulties were to be removed by legislation. A Bill was brought in by Government last Session, and ultimately passed under the title of "The Public Health Act." Mr. Janson and his fellow-parishioners looked to this Act to furnish a convenient and intelligible guide for their future operations. But they find complication still more complicated. A "rural sanitary authority" under the Act possesses all the authorities which belonged to the sewer authority under one class of Acts, and to the nuisance authority under another class of Acts, and to the local authority under three other classes of Acts. Thus, if the "rural sanitary authority" desires to inform itself what are its powers and duties, it must peruse and compare sixteen Acts of Parliament. Of course we know that this can only be done by employing a clerk who is probably a solicitor, and who provides himself with an edition of the "Public Health Act" with notes compiled probably by a barrister. It is sometimes assumed that lawyers cause, or at least profit by, the difficulties of law. But these difficulties arise either out of the nature of the subject or the mode of treating it, and lawyers are not responsible for either. The task of legislating for the complicated interests and requirements of modern society is formidable, but not insuperable. The complaint of Mr. Janson and many other lawyers is that no reasonable precautions are taken to ensure the proper performance of this task. The term "Sanitary Acts" includes, in all, twenty-six Acts, besides the Public Health Act of last year; and all these Acts must necessarily affect the conduct of sanitary authorities. The practical point of these remarks is that lawyers must inevitably obtain a monopoly of the knowledge requisite for sanitary action. No layman can be expected to provide himself with twenty-seven, or even seventeen, Acts of Parliament, even if he has leisure and intelligence sufficient for their perusal. Yet lawyers do not desire to maintain for their own profit a practice which is disgraceful to civilization. Mr. Janson, who is Vice-President of the Incorporated Law Society, may be understood to express the opinion of many members of his own branch of the legal profession, and the opinion of the other branch may be sufficiently inferred from recent utterances of the judges.

There is perhaps too much disposition among barristers who discuss this subject to ventilate large theories instead of considering practical remedies. The controversy about Codes and Digests crops up periodically when the newspapers have nothing else to write upon. Without questioning the importance of this controversy, we would suggest that it might be suspended until the twenty-seven Sanitary Acts have been consolidated into one Act. The "Statistics of Legislation," which we have now before us, are simply frightful. A Parliamentary notice of last November stated that application would be made this Session for a Railway Act which would repeal, alter, or amend the provisions of no less than one hundred and twelve existing Acts. These, of course, belong to the "local and personal Acts," which are kept separate from the "public Acts," and only affect, at least primarily, the Companies which obtain them. But the whole of our legislation proceeds with the same disregard of method and conciseness, and it threatens to end in burying Parliament under the weight of its own statutes. Obscurity often arises from carelessness, but sometimes from design. As Mr. Justice Blackburn says, Acts of Parliament are drawn in a form that will pass, although it will not work, and

thus the onus is thrown upon the judges of interpreting them so that they may work. We hear complaints of the complexity of title to land, and the consequent expense of dealing with it. This complexity is due partly to the attachment of lawyers to an ancient system of law, and partly to the attachment of landowners to certain powers of disposition. But nobody can deny the existence of one complication which might be removed. Yet instead of removing it, Parliament is busy every Session in creating other complications. The law and practice of bankruptcy have been a favourite subject for meddling and muddling. There have been three Bankruptcy Acts within twenty-three years, and as each of these Acts contains provisions on the same subject in different language, the decisions of the Courts on one set of enactments are no authority on another. The capricious change of language by draftsmen who have to deal with the same subject is an evil of which many examples occur in modern legislation. Sometimes perhaps the draftsmen's work is done carelessly, but they might plead that if they did their work carefully it would be spoiled by Parliament. An important Act of Parliament, such as the Public Health Act, ought to be "self-interpreting and self-contained."

The Excise Licensing Act of 6 Geo. IV. c. 81, s. 11 provided that nothing in the Act contained should extend to prohibit any duly licensed person from carrying on his trade in booths or tents at any lawful fair or public race. The Act of 24 and 25 Vict. c. 22, s. 12 enacted that so much of any Act as permitted the sale of beer or spirits, without an Excise licence, should be repealed. The Act of 26 and 27 Vict. c. 33, s. 21 enacted that nothing in the previous enactment contained should extend to prohibit any person licensed by the Excise, as in 6 Geo. IV. c. 81, s. 11 is mentioned, from carrying on his trade in booths or tents at any lawful fair or public race. This enactment was probably passed because it had been suggested that the 24 and 25 Vict. impliedly repealed the privilege of selling at fairs and races which had been granted by the 6 Geo. IV. Then comes the Licensing Act of last year, which provides (s. 72) that nothing in the Act shall affect or apply to the "sale of intoxicating liquor on special occasions in pursuance of the provisions in that behalf enacted." A publican had been convicted by magistrates for selling intoxicating liquors at a fair, and the question came lately before the Court of Queen's Bench whether he had been properly convicted. He would be liable to conviction under the general words of the Act (sec. 3) unless he was protected by sec. 72. Is then a sale at a fair a sale on a "special occasion" in pursuance of previous Acts? The effect of the previous Acts appears to be that a publican duly licensed to sell on his own premises should not be prohibited from selling at a fair. But those Acts do not authorize such sale, and therefore such sale could hardly be called a sale "on a special occasion in pursuance" of those Acts. The phrase "special occasion" seems to have been contrived by the author of the Act of last year to save himself the trouble of mentioning fairs and markets, and in the same careless way he confounded the two ideas of non-prohibition and authorization. The Court of Queen's Bench, after reference to the statutes above cited and to others of earlier date, decided that the conviction was wrong. This was the case in which Mr. Justice Blackburn expressed the wish that the Home Secretary might sit beside him and hear the argument. There is a strong party opposed to fairs and races and to drinking, and it might have been expected that this party would avail itself of the ambiguity of the clause to attack the publicans. This example shows what the judges meant when they said that the Act was framed, not to work, but to pass.

THE ROYAL ACADEMY.

V.

THE judgment which from the first we formed that this year's Exhibition is much below the average has been confirmed by common consent. Still the number of meritorious works calling for notice has seldom been greater, simply because, though leading artists are in decadence, there never has been a time when talent was so abounding. We have spoken of the growing naturalism of the English school; we have also shown how the study of nature has of late been brought under the spell of imagination and the power of emotion, so that many popular pictures of the day are to be read, not as the prose of nature, but as the poetry of nature. A small figure, "Weaving the Wreath" (261), by Mr. Leighton, R.A., may be quoted as a case in point. "The Banquet Scene from the *Tempest*" (286), by Mr. Poole, R.A., though a mistake, also belongs to the same order of creation. Among outsiders we miss this season young Mr. Richmond; the cause of his absence is understood to be some onerous work in fresco on which he is still engaged in a country mansion. Mr. W. V. Herbert, the son of another Academician, must also be remembered among those painters who are giving to the art of the immediate future promise of noble range of thought. "Deus justus et misericors" (575) represents a gondola crowded with gay revellers, among whom we may fancy a mediæval Lord Byron; suddenly the boat comes before a life-size crucifix on a palace wall; the festive company are at once thrown into consternation and contrition; the reality of life and of death dawns on them in their dissipation. The situation is almost too sensational; the old masters pointed a moral more gravely; our modern art is garish, unquiet, spasmodic. The colour is as the sentiment, hectic; the contrast between golden sunlight and purple shadows heightens an effect which verges on violence and scarcely escapes extravagance. Another composition which has deservedly attracted attention is "Argus" (464), by Mr. Riviere, a young painter of something more than promise, remembered in last Academy by "Daniel in the Lions' Den." In this year's work we have yet a further example of the increasing care given to the first conception of a picture. The period is fortunately passing away when our painters found most profit in pleasing the public by pretty trifles; our rising artists paint up to an idea, and yet they escape the penalty which inevitably awaits didactic painting in common with didactic poetry. Mr. Riviere generally manages to tell his story briefly, clearly, and impressively. The old and melancholy Ulysses disguised as a beggar, returning home after an absence of many years, is recognized by his dog. The painter has a happy way of so isolating his principal figure as to fix the eye of the spectator upon the focus of composition. In fact, composition, story, and sentiment are the secrets of Mr. Riviere's success; he owes little to colour, save the suggestion of a sicklied cast of thought which seems responsive to his moody and melancholy monotones. Indeed, as is almost universally found, a complete reciprocity subsists between the painter's play of colour and his range of human sympathy; sickliness and sentimentality have become this artist's bane. "All that was Left of the Homeward-Bound" (986) tells how little of simple nature is left for Mr. Riviere. A dog and a girl on a drifting mast in a tempestuous sea reach that agony point at which an artist bids adieu to the moderation of nature and the manliness of genius. The idea is a platitude, the picture a piece of sensationalism.

It is astounding how mean an impression French critics carry away from our London exhibitions. Thus a writer of the intellectual insight of M. Taine gives as his opinion that English painters of the present day have a colour that is nothing less than brutal, and a design that is no better than microscopically minute. Our Academy, showing itself more merciful to French art, kindly affords from year to year space on the line for the works of M. Édouard Frère; and yet such pictures as "Il est pris" (182) are not superior in character, execution, or colour, to the small genre paintings of Mr. T. Webster, R.A. (269), Mr. F. D. Hardy (167), Mr. J. Clark (140), and Mr. Le Jeune, A.R.A. (156). Also among close observers and careful executants may be named Mr. John Faed (91), Mr. G. B. O'Neil (424), Mr. MacLean (524), Mr. F. Morgan (1071), and Mr. Bedford (1072). Of more than ordinary size and complexity is "Scandal" (158), as narrated by Mr. Storey. Here we are introduced to an afternoon tea of tale-bearing and tittle-tattle; the room is filled by buzzing talk, and yet the picture is kept quiet; and after the method of De Hooghe, atmosphere and daylight circulate around the figures. The composition is as skilfully strung together as if Ostade had arranged the room and the guests; and the general tone and the relation of parts to the whole show a mastery of the fundamental principles of Dutch art. The subject is a little intricate and difficult, hence it may be that the painter fails of his subtlest qualities. A word of commendation is here due to Mr. Crow for a clever and careful composition, "The Introduction of Lady Mary Wortley Montagu to the Kit-Kat Club" (495). Mr. Calthrop again attracts the eye by a sparkle more French than English; "Le Levée de Monseigneur" (346) is a *tableau de société*, a comedy on the manners of high life; the boy prince surrounded by obsequious attendants will never grow into a *grande monarque;* in the spoilt child we read the dying out of a dynasty. The fault of the picture seems to be in the over-emphasis thrown upon accessories, an error into which this adroit artist has before now fallen; thus the hero of the picture is not the pretty boy, but one of those immense four-post bedsteads which figure in French palaces. We must not forget to mention a well conceived work in which M. Tissot has for once the advantage of a serious motive. "The Captain's Daughter" (121), a sick girl in an invalid chair, the father and the ship's company gathering round her in tender solicitude, is a refined and touching composition, altogether earnest in conception, as it is delicate in silvery tone, and studious of simple truth.

The Academy is seldom chargeable with vulgarity; it more frequently errs on the side of refined conventionality. We are sorry, however, to observe in the present year that the naturalism to which our artists are inclining commits them to a rude vigour not always in keeping with good taste. Thus we would quote "The Plague of Her Life" (645), by that versatile artist Mr. Watson, as the reverse of a refined production; also "The Prop of the House" (638), and "Unpleasant for Both Parties" (922), both by Mr. W. Weekes, a painter who has deservedly won his way to good positions in London exhibitions, err on the side of common motives which verge on vulgarism. It seems inexcusable that painters of talent should make such a descent; a desire to gain applause or to raise a laugh ought not to beguile an artist from the paths of sobriety and earnestness. It is curious how much harder it is to put comedy and farce upon canvas than on paper; humour, however, lends itself kindly to oils. Mr. Nicol, A.R.A., has been a humorist in his time; unfortunately, he long looked upon refinement as a weakness, and now that he consents to mitigate his redundant force, it seems to be too late to gain delicacy of hand or subtle reading of character. "Past Work" (624) is simply a surrender of accustomed strength. Mr. Opie, like his kinsman the Academician, has had to get rid of some of the ruggedness which inheres to the primitive naturalism of Cornishmen. "Emissaries of the Long Parliament searching a Royalist's House" (535) has more style and treatment than we

have hitherto observed in this too resolute and relentless student of nature.

The Academy encourages eccentricity less than ever; still a few select freaks of genius prove serviceable foils to the inanities of certain Academicians and Associates who still rule "the line" with the rectitude belonging to dull respectability. Mr. Herkomer, whom we are more accustomed to greet in water-colours than in oils, is one of the several artists who play parodies on Mr. Frederick Walker, A.R.A. "After the Toil of the Day" (657) is a scattered and incoherent collection of people ranged on benches in a straggling Swiss village. The artist has no notion of concentration or unity; we look on this pictorial medley as we would on a parish register; the composition has no more coherence than a column devoted to births, deaths, and marriages. This is not art, at least in the old acceptation of the term. "Summer Days, Long Island" (956), by Mr. Hennessy, is another common theme made conspicuous by eccentricity. M. Legros also persists in the hopeless task of recommending to an English public forms repulsive to taste and irreconcilable with art. M. Zichy, the most notorious of Russian painters, is altogether proper when he chronicles the exploits of the Prince of Wales in the Highlands. The Academy, for some reason best known to itself, has violated, in the admission of these, the most inane works ever executed even at the command of royalty, one of its printed "general conditions" which says, "No works which have been already publicly exhibited in London" "can be received." These ten drawings were exhibited in the Gallery of Mr. M'Lean in the Haymarket in November last, when they obtained notice in our columns.

Portraits are more than ever prominent, partly because there are few great figure compositions to throw them into due subordination. The number of all sorts and sizes we estimate at over two hundred; the styles offer little novelty. It is scarcely necessary to speak of Sir Francis Grant, Mr. Knight, R.A., Mr. O'Neil, A.R.A., Mr. Buckner, or Mr. Weigall, inasmuch as their art has long been stationary. Mr. Millais too, the most fertile in resource of any portrait-painter now living, is contracting a mannerism which has already placed a limit to his further development. It would appear to be his habit, before he takes the first sitting, to send the lady off to a fashionable milliner; and what seems a little strange is, that when she returns to the studio she presents a costume which would be looked on as a screaming horror in any quiet, tasteful drawing-room. It is at this critical point that Mr. Millais steps forward as the true magician; he throws across the scene a rich curtain or a rare tapestry; he evokes trees or fields, he seizes on a hen-coop, or anything else that comes to hand in the distracting emergency; there is nothing he hesitates to do in order to make his portrait a pictorial triumph. By such ready and almost reckless expedients, by the offhand dash of an expert, daring dangers and despising difficulties, he succeeds in attracting the public gaze to every figure which he flings impetuously and carelessly on canvas. No pictures have been so much talked about as the portraits of Mrs. Bischoffsheim (228) and Mrs. Hough (21). This last we cannot rank, as some critics have done, with the mother of Rembrandt; the work is not that of a painter, but of a wall plasterer; the artist has emptied his colour-box on his canvas.

Our portrait-painters divide themselves into several distinctive classes. Thus Mr. Sant, R.A., follows style and fashion, as witness the graceful, dressy figure of "Mrs. Oriel Walton" (253). Mr. Archer, too, throws ladylike delicacy into the figure and drapery of "Mrs. H. Joachim" (304); there is much refinement also in Mr. Lehmann's rendering of "Miss Helen Faucit" (594). Then comes, conspicuous for directly opposite qualities, what may be called the Aldermanic school of portrait-painting; of such is "The late Lord Mayor on the occasion of the reception of Her Majesty at St. Paul's Cathedral on Thanksgiving Day" (113), by Mr. Wells, R.A. The picture merits a place between the two barbaric figures of Gog and Magog in Guildhall. There is yet another class of portraiture, which, having little care for tailoring or millinery, simply strives to bring out the intellectual part of a man. Mr. Richmond, R.A., who gives to his heads a mental outlook or meditative introspection, has been peculiarly happy in the delineation of "The Marquis of Salisbury" (290) and "The Rev. F. K. Leighton" (287). Mr. Watts, R.A., has also seized with habitual breadth and more than usual detail the decisive features of "Mr. William Spottiswoode" (36). This artist, who of all others is a student of mental expression, has seldom cared to throw so much finish and light-handed freedom into the painting of hair and beard. Mr. Watts usually errs on the side of over-generalization. We regret to say that one of our public men, the late Rev. F. D. Maurice (586), has received injury at the hand of Mr. L. Dickenson. The character is misinterpreted, the picture poorly painted. Posterity will depend so greatly on the portraits of our contemporaries that it is as hard to tolerate an inadequate portrait as an incompetent biography.

THE OAKS.

AFTER the Derby running the Oaks became a foregone conclusion for Mr. Merry, provided only that his representative came to the post fit and well, for it was made no secret that Marie Stuart was some pounds better than Doncaster. Still the field for the Oaks was much larger than for the Derby, eighteen fillies starting for the ladies' race; and it might well have been that some owners who witnessed Marie Stuart's signal defeat in the One Thousand Guineas were sceptical about her having had sufficient time since to recover her form completely. Directly she was seen in the paddock, however, all doubts about her fitness were set to rest. The three-year-old colts are not of very high class this year, but the fillies of the same age have, on public form, little pretension to attain even to that modest eminence; so that when it was unreservedly announced that Marie Stuart was considerably superior to the Derby winner, it followed that the task assigned to her in the Oaks ought to be a very easy one. One can believe pretty nearly anything about horses and horse-racing; but it certainly taxed one's powers of belief to be asked to concede that, even on her best public form, Marie Stuart was 21 lbs. better than Kaiser or Gang Forward. She ran her best race last year at Ascot, when, in the New Stakes, she beat Kaiser by four lengths; but Kaiser was not nearly up to the mark then, and later in the season he made up for that defeat by running a dead heat with Surinam for the Middle Park Plate, Marie Stuart not being in the first four. At Newmarket, this spring, we have seen her—unfit no doubt, and incapable of doing justice to herself—well beaten by Cecilia and Angela, neither of whom is within hail of Kaiser or Gang Forward; and yet a month later she is openly proclaimed 7 lbs. better than a horse who has just given Kaiser and Gang Forward a stone beating. We are bound to say that her performance in the Oaks fully justifies all that was said of her. There was but one in the race from start to finish, and the race was won in the commonest of canters. Therefore Marie Stuart must decidedly be classed as the best three-year-old of the year, and unless Doncaster improves as much between May and September as she has improved between the first and the last weeks of May, she is not likely to lose her supremacy. Kaiser and Gang Forward will in all probability never run better than they have run already; how much better Doncaster and Marie Stuart may run is a matter of pure speculation.

Besides Marie Stuart, Mr. Merry started Sonata to make the running, and Lord Falmouth and Mr. Crawfurd also started two each—Cecilia and Silver Ring, as in the One Thousand, representing the former, and Wild Myrtle and Voyageuse the latter. Among the remainder were Angela, a fair trusty sort of mare who rarely misses running into a place, Oxford Mixture, Gratinska, Lady Lyon, Wild Aggie, a much-fancied filly by Young Melbourne, out of Hippia—a former Oaks winner—belonging to Baron Rothschild, and Poldoody, of the highest lineage, by Beadsman, out of Caller Ou, but quite unworthy of such parentage. Most of these have run, and many of them have run so recently that their public form need not be dwelt on here. According to the latest test, the One Thousand Guineas, Cecilia and Angela appeared to be the best; but the fillies generally have run so inconsistently, having alternately beaten one another and been beaten in turn, that, as in the similar case of the colts, one was bound to come to the conclusion that there was hardly a real good one among them. Doncaster the dark rose in his night on the Derby day, and Marie Stuart the reinvigorated followed suit on the Oaks day, and we became conscious that we possessed both a first-class three-year-old colt and a first-class three-year-old filly, each of whom, curiously enough, had been beaten by second-class colts and fillies only a few weeks before. Of the two races the Oaks was much more decisively won; for there were no disappointments, no casualties, no jostling and shutting in or out at Tattenham Corner. Though the field was half as large again as the field for the Derby, and though fillies possess the peculiar excitability of the sex, the race was unmarked by a single untoward incident. The starter despatched them without delay or difficulty; the two pioneers, Voyageuse and Sonata, performed their duty to the best of their powers; the main body of the field occupied as good places as they could get, and ran as fast as they could; and Marie Stuart, not very solicitous in the first part of the race about position, was ready at any moment to take the lead. Having safely rounded Tattenham Corner, and having found herself in the straight without any accident, Marie Stuart was let out by Cannon, and the race was over at once. She came away past the bell, and past the Stand, and past the judge's chair, without even being challenged for a moment by a single antagonist. The three lengths by which she won might have been increased to a dozen at the pleasure of her jockey, and all that those behind her could do was to struggle for the second and third places. For these there was a good race between Wild Myrtle, Angela, and Oxford Mixture, Mr. Crawfurd's mare gaining second money by half a length, and Angela securing the third place by a head. By the victory of Marie Stuart Mr. Merry is returned the winner of the Oaks for the first time, and to all appearance he is going to take leave of the Turf in a blaze of triumph. With Doncaster and Marie Stuart he holds two trump cards for the Leger, in which both of them are engaged, and for which it does not seem possible that both should be defeated. They have decisively beaten the best trained and the best colts and fillies of their year; and we see small prospect of their colours being lowered during the present year.

The incidental racing of the week was more interesting than it usually is, or perhaps, the Derby being such a failure, an unwonted amount of attention was paid to the minor events. The principal two-year-old race of the meeting, the Woodcote Stakes, attracted a field of eleven runners, the Newmarket winner Tomahawk being the most notable public performer among them.

Great expectations were formed of Aventurière—sister to Cantiniere—Kidbrooke, by Young Melbourne, Dukedom, by The Duke, and Marsworth, by King Tom, and to this quartet the race was confined. The finish between Marsworth, Kidbrooke, and Dukedom was very fine, Baron Rothschild's gigantic son of King Tom winning by a head, while Kidbrooke beat Dukedom by a neck only. The winner is a magnificent-looking colt, backward in condition of course, and not likely to exhibit himself at his best for another year, perhaps for two. He looks like making a Cup horse at four years old; but he has many valuable engagements during the present season, and if he is made to fulfil them, we shall not be surprised to see his future prospects nipped in the bud. Baron Rothschild had, an hour or two previously, won a Maiden Plate with Archduke, who disposed of sixteen opponents, and whose victory no doubt strengthened the position of Marsworth for the principal race of the day. On Wednesday Archduke was in turn beaten by Kidbrooke, though by little more than half a length, Tomahawk again vainly endeavouring to carry his penalty to the front. Mr. Merry secured the Two-Year-Old Stakes on Thursday with his chestnut filly by Scottish Chief out of Lady Morgan, who was penalized 5lbs. for winning at Bath. The Acorn Stakes on Friday were won by Peggy Dawdle—beaten half a length on the Wednesday by Kidbrooke—and the Two-Year-Old Plate fell, after a tremendous struggle, to Mr. Winkle, who had 10lbs. extra to carry, and won by a head; Selsea Bill and Berryfield making a dead heat for second place. The honours of the week rest, as far as the two-year-olds are concerned, with Marsworth, Kidbrooke, and Mr. Winkle. The latter horse has even thus early in the season done work enough for one year, and his last race, under such a disadvantage of weight, has shown him to be possessed of sterling qualities. Whether any of the two-year-olds that ran during the week are of the first class is a question which time must decide.

The remaining events may be dismissed in a few words. The Queen's Plate was what Queen's Plates usually are. Dutch Skater and Lilian cantered for about three-fourths of the distance, and raced home together from Tattenham Corner. After a good finish M. Lefèvre's old horse won by a neck. As a six-furlong race it was a very pretty contest; as a test of staying powers it was an absurd farce. On Friday there was a double dead-heat—a circumstance unprecedented at Epsom, though we have seen it happen twice at Newmarket. The race was of no importance, and the dead-heaters, Arcesilaus and Cranbourne, would hardly have been handed down to fame but for this incident in their racing careers. The High Level Handicap, for which twelve started, produced a fine race between Shannon and Uhlan, the former—with all the best of the weights, however—winning by a head. Mr. Savile's ill-luck this season in running second for great races was thus again exemplified. Shannon was totally neglected before the race, it being generally believed that she had quite lost her form; and indeed it was no great performance for a mare that had beaten Favonius in the Goodwood Cup just to shake off in the last stride a moderate horse like Uhlan, from whom also she was receiving a year and 1 lb. We may conclude by saying that the fields during the week were more than up to the average, the minor races, as we have said, not being so utterly dwarfed as usual by the Derby; and the number of close and exciting finishes was very remarkable, although the two great events were carried off pretty easily.

Mr. Hughes made another attempt, on the eve of the adjournment of the House of Commons for the Whitsun recess, to induce the Government to extend the Betting-Houses Act to Scotland, but it was of no avail. The Lord Advocate and Mr. Bruce had not a word to say against the position taken up by Mr. Hughes, that the Betting-Houses Act had stopped a great nuisance in England, and that there was no reason why a similar nuisance should be permitted in Scotland; but they let it be plainly understood that they would not move in the matter themselves. Both of them almost implored Mr. Hughes, or any other private member, to bring in a short Bill to extend the Act, and both promised that it should receive the support of the Government; but both excused themselves from taking any initiative in the matter. Mr. Bruce expressed his opinion that such a Bill would meet with no opposition at all, that in fact it might be carried through all its stages in the course of a few days; yet almost in the same breath, with most singular inconsistency, he declared that the Government could not handle the question without abandoning some other measure; and he hinted, with extreme timidity, that after all it might be opposed, and then what could the Government do? If the Government determined to stop the nuisance of the commission agents in Scotland, and their Bill was opposed, Mr. Bruce would of course have to defend it; but he has already declared that he knows nothing whatever about betting or racing, and the vision of the member for York, who knows all about betting and racing, rising to expose his ignorance, is too much for Mr. Bruce to contemplate with equanimity. So an admitted duty of Government—a duty which could easily be performed without any appreciable sacrifice of time or labour—is either not to be done at all, or is to be tossed to and fro to any private member who may choose to undertake it. If Mr. Bruce and his colleagues have so little opinion of the value of the Betting Houses Act that they grudge a little trouble to make its application uniform and effective, it might as well be repealed altogether. Judging from what we read in the sporting papers, we should say that the Act is pretty freely evaded in England already, and the trade is so profitable that every advantage will be taken of the Home Secretary's apathy to evade it more and more openly, till at length we shall revert to the state of things which existed a few years ago. We suppose that it is hardly necessary to recapitulate the arguments we have often brought forward to prove the necessity of stopping as far as possible the operations of the advertising commission agents. Their trade flourishes as of old, and there is no diminution in the number of their victims. Scotland, as Mr. Miller observed, is being flooded with betting schemes; with schemes, that is, to extract as much money as possible out of the pockets of unwary dupes. Column after column in various London and local papers is taken up with offers of the most flattering nature, such as are most likely to tempt the class for which they are intended. As we have often said, a rough calculation of the money that these betting agents expend in advertising enables us to form some idea of the number of their customers, and of the income that must pour in week by week. The credulous, the ignorant, the idlers who would fain win a week's wages without an hour's work, are ever ready to respond to the appeals made to them to try this system for one week more, or to follow that prophet for yet another meeting. Occasional success stimulates the appetite for gambling; frequent reverses excite the recklessness of despair. The betting agents know with what manner of men they have for the most part to deal, and bait their hooks accordingly. That such a state of things should continue in any part of the United Kingdom is a gross scandal; but a Government which only applies the law in England by fits and starts in occasional moments of virtuous zeal can hardly be expected to be very anxious to add to its responsibilities by extending it where it is not at present in force.

REVIEWS.

THE DUKE OF WELLINGTON AND THE CATHOLIC QUESTION.*

THE letters and despatches in this volume extend from the autumn of 1828 to the middle of the next year—the most critical and important part of the Duke of Wellington's brief and somewhat unfortunate Administration. We are thus enabled to trace the rapid development of the Roman Catholic question, and to understand the peculiar difficulties of the Duke's position in regard to it. The subject has already been pretty fully illustrated by the Memoirs of Sir Robert Peel, the Buckingham Papers, and other publications, and there is not much that is absolutely new to be gathered from the Duke's correspondence. This, however, does not detract from the historical interest and value of the correspondence. It supplies authentic information on various points which have hitherto rested on mere gossip or conjecture; and even a familiar story gains by being told in the Duke's clear, straightforward, tranchant style. In his own way, the Duke was certainly a master of English.

The Duke of Wellington had entered upon office in the beginning of the year on an understanding with the King that the Roman Catholic claims should not be made a Cabinet question, although unanimity in opposition to them was not to be required from members of the Administration. The Clare election, which Lord Palmerston has described as marking a new epoch in Irish history, occurred in July. Mr. Vesey Fitzgerald, the Government candidate, and himself a member of the Government, was personally very popular in the county. He was known to be friendly to Emancipation, and he was supported by the whole strength of the gentry; yet O'Connell defeated him by a large majority. The result of this election was clearly due to the influence of the Roman Catholic priesthood, who marshalled the peasantry, and led them in regiments to the poll. According to a memorandum which is printed in the present volume, orders were given from the altars that the male population of each parish from fifteen to eighty years of age should proceed to Ennis, the county town, and in many places the country appeared to be deserted by the inhabitants, "and all ages participated in the enthusiasm." Moreover, it is mentioned as a further example of the power of the priests and the Catholic Association, that, notwithstanding the heat of the weather, and the prevailing excitement, there was hardly an instance of drunkenness, and the town was as quiet as if nothing extraordinary was going forward. It was clear that what had happened at Clare might and would happen elsewhere, and there could no longer be any doubt that the Roman Catholic Association had practically become the ruling body in Ireland. The Duke of Wellington at once saw that the understanding on which the Government had been formed could not be maintained. Mr. Peel agreed with the Duke that it would be better to try to settle the question than to leave it open, but could not at first bring himself to share the responsibility of making concessions to the Catholics. On the 12th September the Duke thus sums up the situation in a letter to Peel:—"Can we any longer delay to do something? Must not that something be either restraints in Ireland unknown in the ordinary practice of the Constitution, or concessions in some form or other? Can we hope to prevail upon Parliament to impose such restraints? Have we any resource but concession in the existing state of men's opinions in as well as out of doors?" On October 14th the Duke points out to the King that the

* *Despatches, Correspondence, and Memoranda of Field-Marshal Arthur Duke of Wellington, K.G.* Edited by his Son, the Duke of Wellington, K.G. (In continuation of the former Series.) Vol. V. September 1828 to June 1829. London: Murray. 1873.

leaders of the Roman Catholic Association evidently do not intend to commit any breach of the peace, although everything is done to excite hatred and contempt of the Government. It is suggested as not impossible—the Duke says, "I might state it more strongly," and he seems to have believed it as at least highly probable—that the Roman Catholic tenantry might refuse to pay tithe or rent. And if they did, how could the law be enforced? How could there be distraint for rent or tithes upon millions of tenants? For this state of things there was no remedy except "consideration of the whole state of Ireland," which was the familiar euphemism for Catholic emancipation. Two days after the Duke writes to a friend:—"The difficulties of the times have been accumulating for nearly forty years; and I must find a way out of them!!! It is not by means of Brunswick Clubs."

About this time the Cabinet was somewhat disturbed by a peculiarity in O'Connell's costume. It had been discovered that when O'Connell was at Clare during the election he wore "one metal button on a coat of which the other buttons were plain." It was a green coat, and all the buttons were covered with green cloth except this metal one. What could this mean? Sir R. Peel writes to the Duke about it, and the Duke writes to Lord Longford; and a great many eminent men seem to have tossed on the pillow wondering what on earth the metal button meant. There was a general agreement that the button was the signal that the wearer belonged to some illegal association, but nothing definite seems to have been ascertained.

On the 16th November the Duke again addressed the King:—

> The state of society in Ireland is [he writes] daily becoming worse. In the South the worst evils, excepting actual civil war, exist. Combinations have been formed to resist the payment of rent and tithes to members of Brunswick Clubs, in which description is included nearly every Protestant of the Church of England residing in the country; and to bind the Catholics not to deal with members of Brunswick Clubs as shopkeepers. There are cases reported of Protestants not daring to move one hundred yards from their houses.

On the other hand, even the Brunswickers had begun to see that some compromise must be sought for. The Duke had therefore come to the conclusion that the emancipation of the Catholics was inevitable, and he entreated the King to consider a plan which he had drawn up some months before. It appears that the King was unable to use his pen to answer this communication, and could only dictate a brief acknowledgment; but three days afterwards he could write a letter of several pages to the Duke, to thank him for blowing up Lord Anglesey, the Lord-Lieutenant, who was suspected to be leaning too much to the Roman Catholic side, and to praise his "frankness, point, and firmness." The royal letter is dashed with as many italics as a school-girl's effusion:—

> *Consistency* and *firmness is*, and *must be*, the *only line for us to pursue*, if *he will not* take and understand the *very clear* and at the same time liberal and *gentlemanly hint*, in *its tone*, given to him by you in your former letter; *I* and *my government must act for ourselves, and he must be removed by us* as shortly as possible, but with all proper dignity on *our* part, &c.

The Duke's own account of the Lord-Lieutenant given to Lord Bathurst was that he had gone mad, "bit by a mad Papist" or "looking after low popularity." Lord Anglesey was perhaps not very discreet, especially in compromising the Government by his rash communications with O'Connell; but he had a difficult part to play, and it is not surprising that, situated as he was, he should have had a more vivid impression than Ministers in London of the accumulating dangers of delay in conciliating the Roman Catholics. Under the circumstances, however, his recall was inevitable.

In the beginning of 1829 the Government applied itself in earnest to the solution of the question which paralysed its authority in Ireland, and endangered even the integrity of the Empire. On the 12th of January Peel consented to retain office; on the 15th the King gave permission to the Government to take the Catholic question into consideration; and immediately afterwards Cabinet meetings were held to settle the Speech at the opening of Parliament. The King agreed to the draft of the Speech, but very reluctantly. It is stated in Lord Ellenborough's memoranda that "when 'the Duke of Wellington mentioned that the Catholics were to be excluded from judicial offices connected with the Church, the King said, 'What! do you mean a Catholic to hold any judicial office? To be a Judge of the King's Bench?' When seats in Parliament were mentioned, he said, 'Damn it, do you mean to let them into Parliament?'" The management of the King was, in fact, one of the Duke's chief difficulties during the whole of this period. In the opening sentence of the first letter in this volume the Duke writes, as if with mingled surprise and satisfaction, that he had been to Windsor and had found the King "not unreasonable;" and almost the last letter is a complaint of the King's efforts to thwart and humiliate his Ministers. On one occasion Sir W. Knighton reports that "the great difficulty, under present circumstances, is to prevent his Majesty from thinking for himself." The King was suffering from gout, and still more from the effects of the laudanum which he had got into the habit of taking in large quantities. In November Lord Bathurst says he does not like the Duke's account of the King, but "our gracious master knows how to appear ill before his Minister if he thinks that his restoration to health would expose him to unpleasant discussion on political subjects." There can be little doubt, however, that the King was at this time really ill; and early in January his attendants became seriously alarmed. "The ale at dinner," wrote Knighton, "is a part of the concern," but it was "the laudanum system" which naturally excited the gravest apprehensions.
